It is worthy of notice that the complaints made by the Mexican Minister concerning which the opinion of Mr. Attorney General Harmon was written, continued in one form or another for many years after 1895. They resulted in an action brought by the Attorney General of the United States in the District Court of the Third Judicial District of New Mexico against the Rio Grande Dam & Irrigation Company on May 24, 1897. That case reached this Court, and is found as United States v. Rio Grande Dam & Irrigation Company, 174 U. S. 690. The complaint still persisted, and resulted in a special treaty confined to the distribution of the waters of the Rio Grande. In that treaty between the United States and Mexico, the United States agreed, without expense to Mexico,

to furnish and deliver to Mexico 60,000 acre feet of water annually. Mexico agreed on its part in consideration of the delivery of the water above stated, to waive any and all claims to the waters of the Rio Grande between the head of the Mexican Canal and Fort Quitman, Texas, and also declared fully settled and disposed of and waived "all claims heretofore asserted or existing, or that may hereafter arise, or be asserted, against the United States on account of any damages alleged to have been sustained by the owners of land in Mexico, by reason of the diversion by citizens of the United States of waters of the Rio Grande." (34 Statutes at Large, Part 3, Page 2953.)

It is true that the United States in that treaty stipulated that it did not concede any basis for the claims asserted by Mexico, nor concede the establishment of any general principle or precedent by the concluding of the treaty.

(b) In our view, the cases above cited, where courts of the arid region uniformly have disregarded State boundaries in determining questions of right in and to the waters of interstate streams, are strong authorities in point against the contention of Colorado. It would indeed be an anomaly if on an interstate stream the private citizen in one State in a court of justice could sustain his right against a citizen of the

upper riparian State, while the State might not in behalf of numerous of its citizens in like case as *parens patriae*, trustee, guardian, or representative be able to enforce the same rights.

Colorado, as well as Wyoming, has uniformly held that as between individuals no upper riparian proprietor has any right to divert waters from the stream if such diversion shall deprive a lower appropriator from the stream of any portion of the water to which he is entitled. The holding is that the lower appropriator by being prior in time acquires not only a moral right but a right of such force and quality as to be available in a court of equity against the upper riparian proprietor who attempts by later appropriation to deprive the prior appropriator of any portion of his water. The holding of both of these States, and of other States in the arid region, is that the inherent principles of equity require the recognition of the rights of the prior appropriator as of full force, and that the upper riparian proprietor has no right, either growing out of his position as upper proprietor or otherwise, to diminish the flow required by the prior appropriations of the lower proprietor. The fact that he finds the waters on his premises gives him no right whatever to invade the strong equitable, and indeed legal right, which all of the arid States insist has been acquired by the prior appropriation,

and every court that has been required to pass upon the question holds that the interposition of a State boundary in nowise affects the validity of these private rights.

If it is equitable as between individuals that the prior appropriator shall be prior in right, it is difficult to see why the equity should not be the same if the two proprietors happen to be States instead of individuals. Shall not a State also do equity?

(c) Colorado and Wyoming were a part of the public domain, with no State boundary between them, at a time when, according to the decisions of both States, the doctrine of prior appropriation was in force here. Neither State had been admitted into the Union when Congress enacted the law of 1866. Indeed many of the prior appropriations made in Wyoming from the stream in controversy, as shown by the evidence here, were made when no State boundary had been interposed between the source and the mouth of the Laramie River. The language of this Court in the case of Bean v. Morris, 221 U. S. 485, is applicable here. In that case this Court said:

> "The doctrine of appropriation has prevailed in these regions probably from the first moment that they knew of any law, and has continued since they became territory of the United States. It was recognized by the statutes of the United

States, while Montana and Wyoming were such territory, and is recognized by both States now. Before the State lines were drawn of course the principle prevailed between the lands that were destined to be thus artificially divided. Indeed, Morris had made his appropriation before either State was admitted to the Union. The only reasonable presumption is that the States upon their incorporation continued the system that had prevailed theretofore, and made no changes other than those necessarily implied or expressed."

In the case of Bean v. Morris last above cited, this Court used this further language:

"But with regard to such rights as came into question in the older States, we believe that it always was assumed, in the absence of legislation to the contrary, that the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the State that could be acquired from within." Citing, Mannville Co. v. Worcester, 138 Massachusetts, 89. Thayer v. Brooks, 17 Ohio, 489. Slack v. Walcott, 3 Mason, 508, 516. Stillman v. White Rock Manuf. Co., 3 Woodb. & M. 538. Rundle v. Delaware & Raritan Canal Co., 1 Wall. Jr. 275, 14 How. 80. Foot v. Edwards, 3 Blatchf. 310. Wooster v. Great Falls Manuf. Co., 39 Maine, 246, 253. Armendiaz v. Stillman, 54 Texas, 623; State v. Lord, 16 N. H. 357. Howard v. Ingersoll, 17 Alabama, 780, 793.

(d) The decisions of this Court in the case of

Kansas v. Colorado, seem to us to go far towards denying the defense that Colorado attempts to make in this case through its alleged rights as a sovereign State. In passing on the demurrer in that case, the Court considers, first, the question whether the cause of action presented there was of a justiciable nature. This discussion arose upon a claim there made on behalf of Colorado on the ground of its sovereignty identical with the claim here. This court, after reviewing a number of earlier decisions of the Court on the question of controversies between States, used this language:

> "Applying the principles settled in previous cases, we have no special difficulty with the bare question whether facts might not exist which would justify our interposition."
>
> *Kansas v. Colorado*, 185 U. S. 125, 144.

In the decision of that case on the merits, while the State of Kansas was denied relief upon the facts, the Court uses this language:

> "It is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes."
>
> *Kansas v. Colorado*, 206 U. S. 46, 117.

The defendants have sought to weave into a defense several theories.

One of the matters sought to be proven is that there is a very large mean flow of water in the Laramie River. Upon this the defendants produce the theories of Mr. Field, formed not from his own observations but from observations and records made by others. In reaching his results, moreover, this witness, as we have seen, accepts and uses the high figures of the various observers, and rejects figures showing low stream flow, and only low figures.

Over against the theories of the defendants so formed, the plaintiff has given the actual computations of the witness Meeker, made from his own actual observations and measurements. Besides this testimony the plaintiff has also put in evidence the acid test of experience—the actual share of the river's flow that is required by the lands irrigated in Wyoming, as determined by the actual experience of many years. This actual experience discloses that in every year save two, there were no surplus waters in the stream above the amount required for the irrigation of the Wyoming lands, and that on the contrary there was in several of the years an actual shortage of water to such an extent that owners of lands under the Wheatland project actually assessed themselves $2.50 per acre in order to increase their insufficient supply of water.

Not only is the preponderance of the evidence with the plaintiff as to the amount of the annual flow of the Laramie River and therefore the amount of the so-called mean flow but the law and the evidence make plain that the mean flow of the river bears but slightly upon any matter here in issue.

The heavy flow of the floods in the river cuts no figure in the case of one who takes water for his needs from day to day out of the river channel. The excess flow above his requirements yesterday would have done him damage rather than benefit if flooded over his lands. At least it has passed on down the river and is not available to meet the deficiency in to-day's supply.

The appropriator is not required, as against one who comes later to the stream, to store the surplus of the floods. He may equitably insist that to the extent of his requirements the stream shall flow down to him each day as it has been wont to flow. This is the equitable rule which, as we have seen, is reached by all the authorities, and the reasons for it are too plain to require argument.

In this case even the aggregate flow is required by the prior appropriators in Wyoming, much more is it true that the reduced flow of later June and the whole of July and August is already below the requirements of the prior Wyoming appropriators.

But it is urged that we should not be permitted to retain and use the water, although our appropriations are prior to those of the defendant, because the water can be made more valuable in the Poudre Valley in Colorado. The fact that the water can be made more valuable there must be conceded on the evidence. This has nothing which seems to us even remotely a ground for depriving the Wyoming appropriators of their prior right. The use of the water in Wyoming has been beneficial. This is all that is required.

In a contest for property of any kind we have never known a case where it was held material that one of the parties could make better use of the property involved than the other.

We submit that the defendants should be enjoined as prayed.

DOUGLAS A. PRESTON,

Attorney General of the State of Wyoming and Solicitor and of Counsel for the Plaintiff

THE STATE OF WYOMING, COMPLAINANT,
vs.
THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, AND THE LARAMIE-POUDRE RESERVOIRS & IRRIGATION COMPANY, DEFENDANTS.

BRIEF FOR DEFENDANTS.

VOLUME I.

FRED FARRAR,
Attorney General of the State of Colorado.
DELPH E. CARPENTER,
Attorney for The Greeley-Poudre Irrigation District.
JULIUS C. GUNTER,
Attorney for The Laramie-Poudre Reservoirs & Irrigation Company.

THE SMITH-BROOKS PRESS, DENVER

NOTE

The original transcript, together with all exhibits in this case, is filed in the office of the Clerk of the Court at Washington. This original transcript consists of nine volumes of typewritten matter, the first three being the evidence of the complainant in chief, the fourth to eighth, inclusive, the evidence introduced by the defendants, and the ninth complainant's evidence in rebuttal.

Pursuant to an order of court, an abstract of this evidence containing certain selected exhibits has been printed with the pleadings, the motions, orders, etc. In this abstracted transcript, which consists of two volumes, so printed, the pages of the original transcript are shown in the margin and it is these original transcript pages or marginal abstract pages to which reference is made in this brief.

This brief consists of two volumes, the first being a general treatment of the facts and the law; the second volume is devoted exclusively to a discussion of the facts and the law relating to Inter-watershed Diversions and Priority of Diversions, the evidence upon these two subjects being so voluminous and complicated that it was thought better to treat the discussion of them in a separate volume rather than to attempt to incorporate it into the main brief.

A brief descriptive list of defendants' exhibits is placed in an appendix at the end of each volume of this brief.

In the Supreme Court of the United States.

OCTOBER TERM, 1916.

No. 7, Original.

THE STATE OF WYOMING, COMPLAINANT,
vs.
THE STATE OF COLORADO, ET AL., DEFENDANTS.

BRIEF FOR DEFENDANTS.

This is an original proceeding in this court, instituted by the State of Wyoming as Complainant, vs. The State of Colorado, The Greeley-Poudre Irrigation District and The Laramie-Poudre Reservoirs & Irrigation Company as Defendants, to enjoin a present and threatened diversion of water from the interstate stream, the Laramie River. The diversion is made from a section of the stream within Colorado and the irrigation system and point of application are within that state. The stream is non-navigable.

The cause came on upon demurrer, the demurrer was overruled without prejudice, and the cause ordered heard upon the merits. In course, answers were filed by the defendants, and a replication thereto by the complainant. Other mention of these pleadings is unnecessary at this stage.

The action was instituted in May, 1911. The controlling facts are without dispute. The court will take judicial notice of many of the most important facts, and as to such facts as are in conflict, the conflict is of such a character as not to affect the merits of the case.

> "It has been very justly observed at the bar that the court is bound to take notice of public facts and geographical positions."
>
> United States vs. Rio Grande Irr. Co., 174 U. S., 690

"The law of any state of the Union, whether depending upon statutes or upon judicial opinions, is a matter of which the courts of the United States are bound to take judicial notice."

Lamar vs. Micou, 114 U. S., 218, 223.

It is thought the case will not turn upon any nice distinctions of fact.

The facts, certain of which will be hereafter discussed under subheads, are these: The Laramie River rises in the Medicine Bow and Green Mountains in Larimer County, Colorado, flows thence northerly through a narrow valley lying between the Medicine Bow Mountains and the Green Mountains, a distance of about 27 miles, to the Colorado-Wyoming line, thence through the Laramie Plains in a northeasterly direction. The Laramie is joined on the Laramie Plains by the Little Laramie before it reaches the Wheatland Reservoir, a channel reservoir. The river flows thence through the mountains and on past the Wheatland country to its junction with the North Platte River at Fort Laramie. Among other tributaries to the stream in this last mentioned section are the North Laramie, the Sybille and the Chugwater streams. The length of the stream from its origin in the Medicine Bow mountains to its union with the North Platte River at Fort Laramie is 150 miles or more.

Substantially all of the tributaries of the Laramie River which drain the Colorado watershed, except Sand Creek, Johnson Creek and Beaver Creek, join the river before it reaches the Colorado-Wyoming line. This Colorado drainage area is 393 square miles, and while there is some conflict as to the run-off therefrom, which conflict will be later discussed, we are justified for the present consideration in stating it to be, at the Colorado-Wyoming line, an annual run-off of 250,000 to 300,000 acre feet. The total drainage area of the Laramie River is 4,076 square miles, about 3,600 square miles of which drainage area is within the State of Wyoming, no part of which drainage area within Wyoming contributes to the diversions sought to be enjoined in this suit or any other diversions which it is practicable for Colorado to make in the future. Only 63.5 miles of this drainage area within Colorado is tapped by the diversion sought to be enjoined herein. The total run-off of the Laramie River in Colorado and Wyoming is in excess of 470,000 acre feet. The only portion of the Colorado run-off that can be availed of in the State of Colorado within the watershed of the Laramie River is that portion which is applied upon 4,250 acres which lie along the section of the stream within the State of Colorado and constituting the narrow valley herein-

before mentioned. The only water that can be diverted from the upper reaches of the Laramie River or any other part of the stream for use within the State of Colorado is a maximum of 91,000 acre feet and it can only be availed of by carrying it to another watershed. Natural conditions have placed a limitation upon the possibility of diverting any larger amount of water from the Laramie River for uses in Colorado.

Some years ago a diversion was made by the Sky Line ditch from a section of the Laramie River in the Medicine Bow Mountains, and the water carried over and dropped into the Poudre River and applied for irrigation purposes to lands in the Poudre Valley, another watershed. The average possible diversion through this ditch is 16,000 acre feet annually.

Another diversion from a tributary of the upper section of the Laramie River is the Sand Creek diversion of 4,000 acre feet annually. This water is carried from Sand Creek into Sheep Creek and thence for irrigation purposes in the Poudre Valley.

These two diversions, aggregating 20,000 acre feet, are not attacked in this proceeding. These diversions cannot be enlarged. The actual diversion that is being attacked is 56,000 acre feet annually, which the evidence shows can be diverted through what is known as the tunnel and the tunnel reservoir. This water is to be conveyed through the tunnel, thence into the Poudre River, a tributary of the South Platte River, and thence on for application to a beneficial use in the Greeley-Poudre District.

It is possible for the Greeley-Poudre District to enlarge this diversion of 56,000 acre feet by 15,000 acre feet through certain collection ditches which might be constructed to a tributary known as McIntyre Creek on the Colorado section of the Laramie watershed. If the enlarged diversion be made, the aggregate diversion through the tunnel will be 71,000 acre feet. This actual and proposed diversion is attacked in this proceeding, that is, Wyoming is not contesting the diversions of 16,000 acre feet through the Sky Line Ditch or the 4,000 acre feet diversion through Sand Creek, but is contesting the present and proposed diversion through the tunnel which may reach an aggregate of 71,000 acre feet. Wyoming is thus contending that from a run-off of 470,000 acre feet of an interstate stream, 300,000 acre feet of which is provided by the Colorado watershed and enters the stream within Colorado, Colorado should have 20,000 acre feet and Wyoming 450,000 acre feet.

As hereinbefore stated, the aggregate diversions that are possible from the Colorado section of the Laramie River watershed are 91,000 acre feet. If this bill be dismissed, the Colorado interests will be entitled, without question, to make aggregate diversions of 91,000 acre feet.

The State of Colorado is here represented by her Attorney General, insisting upon and claiming the right in her sovereign capacity to divert the 91,000 acre feet annually. The controversy is not between private parties; it does not involve a question of private interests, but is between the two sovereignties of Wyoming and Colorado, Wyoming denying the right of Colorado to avail herself of a reasonable part of this great natural resource and Colorado insisting that it is a reasonable exercise of one of her rights as a sovereignty to appropriate from this great natural resource which is originated and created within her limits the 71,000 acre feet sought to be enjoined herein.

Colorado became a state in 1876. At that time there were no diversions from the Laramie River in the State of Wyoming except two small diversions, aggregating not to exceed 51.33 second feet, which diversions cannot be affected by the diversion which Colorado herein insists upon her right to make. The question of vested rights, therefore, cannot arise in this proceeding.

Wyoming became a state in 1890. The two new states came in with equal rights and vested with all of the rights as to their respective natural resources as were held by the original thirteen states.

Every diversion that Wyoming citizens had made prior to 1890 from the Laramie River, and also those subsequent to 1890, can be satisfied without impairing the diversions, the rights to which are insisted upon by Colorado in this proceeding. When Colorado became a state, there was no appropriation in Wyoming but what could be satisfied and yet have an excess of water to satisfy the diversions sought to be enjoined herein. Further, all diversions in Wyoming existent when Wyoming became a state can be satisfied and yet leave more than sufficient water to supply the demands of Colorado presented herein. No question of disturbing rights which had vested prior to the erection of the two states is presented.

The doctrine of prior appropriation by reason of the necessities existing in the arid region prevailed at all times therein, furthermore, as far back as 1866 by federal legislation the existence of such doctrine was recognized to be applicable to the arid regions.

> "The Congress of the United States, appreciating that nearly one-half of the National Domain consists of arid lands which can be utilized for occupancy only by free use of waters from flowing streams, recognized this necessity for such use in numerous acts, commencing with the act of July 26, 1866, and including the Reclamation Act of June 17, 1902, and one or more subsequent acts. These acts are cited simply for the purpose of

showing the recognition by the legislative department of the Government of the conditions which made the arid portion of our country different from the humid portion and which required a wider scope for necessary natural uses than would be the case in a region of abundant rain fall.

This legislation has been held by this court not to be the creation of new rights among the people *inter sese* so much as a recognition of existing rights."

Broder vs. Water Co., 101 U. S., 274, 276.

U. S. vs. Rio Grande Irr. Co., 174 U. S., 690, 704.

Gutierres vs Albuquerque Land Co., 188 U. S., 545, 553.

The relation of the Federal Government to the waters of streams like the Laramie was that of sovereignty. This relation passed to the states upon their erection without any express legislation. The passage of such right to the states arose just like the doctrine of prior appropriation, that is, through the doctrine of necessity. The original thirteen states were the owners of the great natural resources. The new state, in its sovereign capacity, became the owner of such resources.

Martin vs. Waddell et al., 16 Peters, 367.

The original thirteen states were owners, in their sovereign capacities, of the waters of their rivers, navigable and non-navigable. As to the navigable streams, this ownership in their sovereign capacities was subject to the paramount right of control in the National Government over such streams for purposes of navigation, but subject to this paramount easement in the National Government, the ownership in their sovereign capacities was as absolute in navigable streams as in non-navigable streams.

"By the preceding course of reasoning we have arrived at these general conclusions: First, the shores of navigable waters and the soils under them were not granted by the Constitution to the United States, but were reserved to the States respectively. Secondly, the new States have the same rights, sovereignty, and jurisdiction over this subject as the original States."

Pollard's Lessee vs. Hagan et al., 3 Howard, 230, Decided in 1845.

"In like manner, the States own the tide waters themselves, and the fish in them, so far as they are capable of ownership while running. For this purpose the State

represents its people, and the ownership is that of the people in their united sovereignty."

McCready vs. Virginia, 94 U. S., 394.

"The title thus held is subject to the paramount right of navigation, the regulation of which, in respect to foreign and interstate commerce, has been granted to the United States. There has been, however, no such grant of power over the fisheries. These remain under the exclusive control of the State, which has consequently the right, in its discretion, to appropriate its tide waters and their beds to be used by its people as a common for taking and cultivating fish, so far as it may be done without obstructing navigation."

Ib.

"Upon the admission of California into the Union upon equal footing with the original States, absolute property in and dominion and sovereignty over, all soils under the tide waters within her limits passed to the State, with the consequent right to dispose of the title to any part of said soils in such manner as she might deem proper, subject only to the paramount right of navigation over the waters, so far as such navigation might be required by the necessities of commerce with foreign nations or among the several States, the regulation of which was vested in the General Government."

Weber vs. Harbor Commissioners, 18 Wall., 57, 65.

"California was admitted into the Union, September 9, 1850, and the act of Congress admitting her declares that she is so admitted on equal footing, in all respects, with the original States. The settled rules of law in this court is, that the shores of navigable waters and the soils under the same in the original States were not granted by the Constitution to the United States, but were reserved to the several States, and that the new States since admitted have the same rights, sovereignty and jurisdiction in that behalf as the original States possess within their respective borders.

When the Revolution took place the people of each State became themselves sovereign, and in that character hold the absolute right to all their navigable waters and the soils under them, subject only to the rights since surrendered by the Constitution.

Necessary conclusion is, that the ownership of the lot in question, when the State was admitted into the

Union, became vested in the State as the absolute owner, subject only to the paramount right of navigation."

Mumford vs. Wardwell, 6 Wall., 435, Decided in 1867.

"For when the Revolution took place, the people of each State became themselves the sovereign; and in that character hold the absolute right to all their navigable waters and the soils under them for their own common use, subject only to the rights since surrendered by the Constitution to the General Government."

Martin vs. Waddell, 16 Peters, 367, 411.

" 'The original States possessing this interest in the waters within their jurisdictional limits, the new States can not stand upon an equal footing with them as members of the Union, if the United States still retain over their navigable waters any other right than is necessary to the exercise of its constitutional powers.' "

Mobile vs. Eslava, 16 Peters, 253.

"The United States, then, may claim for the public an easement for transportation of merchandise, etc., in the navigable waters of the original States, while the right of property remains in the States."

Ib.

"If sovereign over navigable waters, is there any reason to say the States are not sovereign over the non-navigable waters? How did the States retain their right? They retained it by withholding it from the General Government."

Senator Teller.

"The right of Alabama and every other new State, to exercise all the powers of government, which belong to, and may be exercised by the original States of the Union, must be admitted, and remain unquestioned, except so far as they are temporarily deprived of control over the public lands."

Pollard's Lessee vs. Hagan, 3 How., 224.

See also Illinois Central Ry. Co. vs. Illinois, 146 U. S., 435.

In Martin vs. Waddell, 16 Pet., 367, it was held that, when the American Revolution was concluded,

> "the people of each state became themselves sovereign; and in that character hold the absolute right to all their navigable waters, and the soils under them, for their own common use, subject only to the rights since surrendered by the Constitution."

In Pollard vs. Hagan, 3 How., 212, it was held:

> "That the shores of navigable waters and the soils under them were not granted by the Constitution of the United States, but were reserved to the States respectively, and the new states had the same rights, sovereignty, and jurisdiction over the subject as the original States."

In the case of The Genesee Chief, 12 Howard, 443, it is said (in reference to the proprietorship of the bed and shores of the Great Lakes and other navigable waters, above as well as below the flow of the tide):

> "It properly belongs to the States by their inherent sovereignty, and the United States has wisely abstained from extending (if it could extend) its survey and grants beyond the limits of high water."

In Hardin vs. Jordan, 140 U. S., 371, it was held that:

> "Grants by the United States of its public lands bounded on streams and other waters, made without reservation or restriction, are to be construed, as to their effect, according to the law of the State in which the lands lie."

In the opinion, after stating that the title to the shore and lands under water is in the States and is regarded as incidental to its sovereignty, it is said:

> " 'The lands are subject to state regulation and control, under the condition, however, of not interfering with the regulations which may be made by Congress with regard to public navigation and commerce. * * * This right of the States to regulate and control the shores * * * is the same as that which is exercised by the crown in England.' "

The pith of this decision is that it is one of the sovereign rights of a State to own and control its waters, subject, how-

ever, to the superior control of the National Government for the purposes of navigation and commerce, the Federal Government being limited to certain excepted and enumerated powers, among which is the right to control all navigable streams for purposes of navigation and commerce.

In the Enabling Act it is recited:

> "Which state (Colorado), when formed, shall be admitted into the Union upon an equal footing with the original states in all respects whatever, as hereinafter provided."
>
> Enabling Act, 1 Mills Ann. Colo. Stats., —, c. 23.

The Constitution, made in pursuance of said Enabling Act, prescribes:

> "The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided."
>
> Article 16, Sec. 5, Colorado Constitution.

This was simply the declaration of sovereign ownership, common ownership for the people of the State at large.

The proclamation admitting the State provides:

> "And for the admission of such state into the Union on equal footing with the original states."

Colorado judicial construction and Colorado development have proceeded upon this theory of state ownership of the waters of the streams of the state.

The case of Stockman vs. Leddy, 55 Colo., 24, involved the validity of an appropriation by the state legislature for the protection of the rights of the state and its citizens in the natural streams of the state. The appropriation was held valid and that the General Assembly had the power and was charged with the duty of protecting the interests of the state in the natural streams. *Inter alia* the court said:

> "This constitution of ours was ratified and adopted by the legal voters of the state in accordance with the conditions prescribed by the enabling act of congress, and the president of the United States in his proclamation admitting Colorado into the Union found the fact to be that the fundamental conditions imposed by con-

gress on the State of Colorado to entitle it to such admission had been complied with. Congress, in passing the enabling act, and the President, in issuing his proclamation, were aware of the existing physicial conditions and of the topography and geography of the state. The federal government, by its lawmaking and executive bodies, knew that the natural streams of this state are, in fact, nonnavigable within its territorial limits, and practically all of them have their sources within its own boundaries, and that no stream of any importance whose source is without those boundaries, flows into or through this state. The entire volume of these streams is therefore made up of rains and snows that fall upon the surface of lands included within the exterior lines of this state and of springs which issue from the earth within the same area. Such being the peculiar conditions, the state was justified in asserting its ownership of all the natural streams within its boundaries. When Colorado was admitted into the Union with such a constitution, the federal government, through its lawmaking and executive departments, thereby recognized and confirmed such right of ownership as belonging to the state in its sovereign capacity. We therefore find it to be not only that our state constitution and pertinent statutes, but the decisions of the courts and duly announced public policy, all are in accord on the proposition to which the federal government has, as we have just shown, given its consent that the waters of the natural streams of this state belong to the people, to the state, in its sovereign capacity, and that its right to their distribution and control within its borders is free from any interference by any other sovereignty."

* * * * * * * *

"The right of congress to regulate and control navigable interstate streams and the jurisdiction of the Supreme Court of the United States to determine, in a controversy between two or more sovereign states over the waters of an interstate stream, whether they are reasonably exercising their inherent powers of sovereignty, are not overlooked or questioned by us; but these considerations do not, for the reasons above stated, affect or bear upon the right of ownership and control by Colorado of its own natural streams, and its power and authority to regulate the distribution of their waters, within its own territory, for beneficial purposes. We find nothing in United States v. Rio Grande Irrigation

Co., 174 U. S. 690, 19 Sup. Ct., 770, 43 L. Ed. 1136. Kansas v. Colorado, 206 U. S. 46, 27 Sup. Ct. 655, 51 L. Ed. 956, Rickey L. & C. Co. v. Miller & Lux, 218 U. S. 258, 31 Sup. Ct. 11, 54 L. Ed. 1032, Bean v. Morris, 221 U. S. 485, 31 Sup. Ct. 703, 55 L. Ed. 821, or in any other case that has been brought to our attention, which militates against our conclusion, when these cases are considered, as they should be, in connection with the facts on which they were determined. We therefore conclude that the general assembly, in order to protect the rights of the state in our natural streams and their waters, and the interests which its citizens have acquired thereunder, may make a valid appropriation of money for the purpose of protecting and defending them."

"The rights of riparian owners of land situated upon navigable rivers are to be measured by the rules and decisions of the courts of the state in which the land is situated, whether it be one of the original states or a state admitted after the adoption of the Constitution."

St. Anthony Falls W. P. C. v. St. Paul Water Commissioners, 168 U. S. 349.

Further, that the extent to which a sovereign state may insist upon this right rests largely with her.

In Hudson Water Co. vs. McCarter, 209 U. S. 349, 357, it is said:

"It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will."

Observe also the significant language appearing elsewhere in the opinion of the court in this same case:

"But we agree with the New Jersey Courts, and think it quite beyond any rational view of riparian rights that an agreement, *of no matter what private owners*, could sanction the diversion of an important stream outside the boundaries of the state in which it flows. *The private right to appropriate* is subject not only to the rights of lower owners, but to the initial limitation that *it might not substantially diminish* one of the great foundations of public welfare and health." (Italics ours.)

And in Georgia vs. Tennessee Copper Co, 206 U. S. 230:

> "If any such demand is to be enforced, this must be notwithstanding the hesitation that we might feel if the suit were *between private parties*." (Italics ours.)

and in the same case:

> "Whether Georgia, by insisting upon this claim, is doing more harm than good to her own citizens, is for her to determine."

And in Hudson Water Co. vs. McCarter, supra, this language:

> "But it is recognized that the state, as quasi sovereign and representative of the interests of the public, has a standing in court to protect the atmosphere, the water and the forests within its territory irrespective of the assent or dissent of the private owners of the land most immediately concerned."

And observe this language:

> "But when the *state itself* is concerned and by its legislation expressly repudiates the rights set up, an entirely different question is presented."

August 25, 1902, when there was an abundance of water to satisfy all appropriations existent and initiated for the purpose of irrigating Wyoming lands, Colorado citizens initiated the appropriation rights which are sought to be enjoined in this proceeding.

A large section of the most fertile lands within the State of Colorado, to-wit, the lands embraced within the Greeley-Poudre Irrigation District, were lying arid and without the possibility of development without irrigation. They were located at a favorable altitude, were productive in character, and were contiguous to lands which had been developed by irrigation and which were among the most valuable and productive lands in the United States. All this area of 125,000 acres, most of which at that time was unoccupied Government land, required to be brought to a high state of fertility was the presence of water for irrigation purposes. The capacity of the immediate streams and watersheds for securing water was exhausted. The only source from which water could be secured to reclaim this land was to enter another watershed and tap the upper reaches of the Laramie River. This was the only practicable source of securing water. Engineers were employed, investigations were made, and the conclusion reached that it was practicable, at enormous cost, to reach these waters, gather and equalize

them in the reservoir known as the tunnel reservoir, shown on Defendants' Exhibit 1, drive a tunnel through the Green Mountains about two miles in length, deposit the waters in the Poudre River and thence convey them along the river and through artificial channels a distance of about 125 miles to the Greeley-Poudre District. Filings in aid of water rights were made, ditch and reservoir construction entered upon, and from that date to this, there has been a continuity of the struggles of these people to build and use this system. Fortunes have vanished, lives have been lost, but still the struggle has gone valiantly on. The undertaking was of a more stupendous character than its bold conceivers at first dreamed. Heavy construction work for gathering the waters to be precipitated into the tunnel was involved. The construction of a tunnel reservoir, the driving of a tunnel at a cost of more than half a million dollars and the various other steps detailed in the fuller discussion of this undertaking were made for the purpose of bringing it to a practical conclusion. Under the laws of Colorado, an irrigation district was formed of 125,000 acres in Weld County, bonds were voted amounting to $5,100,000 which constituted, as to their payment, a lien upon the lands of the district. Bonds of the par value of about $2,700,000 of this issue have gone into this construction. The bonds were issued in December, 1909, and work went vigorously on until the institution of this suit. After the institution of this suit in 1911, the sale of the bonds was materially impaired and further construction has proceeded according to the resources of the district, which have been limited.

The construction of this system is practicable. The construction of this system will be completed if Colorado prevails in this suit. If the system is completed, the water will be used for the reclamation of one of the most valuable districts of the west. If this system is not completed, which it will not be if this suit is lost, instead of the waters of the Laramie River being applied to the reclamation of valuable lands, they will be wasted, comparatively speaking, upon the arid lands of the Laramie Plains. If this water be applied upon the Laramie Plains, it will be applied to a district of country which has an altitude of about 7,000 feet, where the soil is indifferent, the growing season is short, being about 56 days, where the yield per acre under any system of agriculture or irrigation will be slight as compared with the production of the Poudre Valley, and will be confined to such crops as hay, alfalfa and crops which can be grown in a very short season. The hay yield, whether as to natural hay or alfalfa, will be small and far inferior in quantity to the yield in the Poudre Valley. If the water which is now used upon the Laramie Plains were economically used, it is ample to supply many times all the lands

there under cultivation, leaving unimpaired the threatened diversion for Colorado. The better portion of the Wyoming land lies in the Wheatland district. Water to supply all of this country can be furnished by the diversions from the Laramie River, Sybille and Chugwater Creeks and yet leave water sufficient to supply all reasonable needs of the Laramie Plains and also the Colorado diversions.

If this diversion be allowed to Colorado, it will go to land which can be watered from no other source; it will be applied upon land from which the highest returns that are practicable under irrigation will be secured; it will be applied to lands where every favorable condition exists. If this diversion be taken from Colorado, it will work no substantial benefit to Wyoming, where its non-productive lands are now sufficiently supplied with water and will, in effect, be wasting not only a great natural resource of the State of Colorado, but a great natural resource that will mean not only great beneficial results to the people of the State of Colorado, but great practical results indirectly to the people of the nation. To deprive Colorado of this natural resource is simply to annihilate, in a degree, the producing power of the lands of the country which is needed for the sustenance of its people.

The Wyoming priorities as they existed at the time of the initiation of the Colorado diversion, August 25, 1902, will be discussed exhaustively hereafter. The character of the Wyoming lands as to productiveness, the system of irrigation in Wyoming as it exists, the great loss in dead storage, the great loss in wasteful irrigation, will also be discussed hereinafter and all go to show that if Wyoming irrigators would economically use the waters that are going to them after the Colorado diversions, they would have no shortage in their supply.

To sum up the facts, the water which Colorado seeks to divert is a part of a great natural resource within the state. The conditions within this state are such as to render necessary this diversion for uses within Colorado. The necessity for this use cannot be supplied from any other source. It is the contention of Colorado that these waters belong to her in her sovereign capacity, that it is but a reasonable exercise of one of her rights of sovereignty to divert this water and apply it to her necessary uses within her limits; that in so doing she is exercising reasonably one of her rights of sovereignty, and in truth is working no practical damage to the State of Wyoming. On the other hand, to sustain this bill and sustain the contention of the State of Wyoming would be to give her practically all of the waters of an interstate stream, to take from the State of Colorado practically all of a great natural resource, to take from Colorado a portion of this resource which would be, in a large measure, wasted upon unproductive lands and even the loss of which

could be abundantly supplied by Wyoming reasonably and economically using that which she now has.

Were Wyoming to prevail in this suit, it would mean to take a great natural resource from her sister state and fasten upon her streams and her lands a servitude unreasonable in its prejudicial effects upon Colorado and wasteful in its beneficial effects to Wyoming. In fact, if this suit were to be dismissed, Colorado, by reason of natural conditions, could never divert more than a maximum of 91,000 acre feet annually from this stream, and if Wyoming would economically use the water remaining and eliminate her present wasteful use, she would save for beneficial use more water than is involved herein.

As stated in the inception, this case will turn upon no nice distinctions of fact. The facts which are in this record without substantial dispute, aided by facts of which the court takes judicial notice, will suffice as to fact to enable this court to rule this case. Take for example such subjects as the development of the Greeley-Poudre Irrigation system, its difficulties, its extent, its highly beneficial purposes, the productiveness of the Poudre Valley, the irrigation system of the Laramie River, its condition when the Greeley-Poudre diversions were initiated, its steps chronologically since, the altitude, the climatic conditions, the character of the soil, nonproductiveness of the Laramie Plains, the interwatershed diversions, national, international, interstate, intrastate, all deserve and will receive full discussion as this brief proceeds.

As to the subject of interwatershed diversions. The time has been in the history of jurisprudence when water in some jurisdictions was not permitted to go beyond the watershed, but the common law being interpreted consistently with natural conditions has, at all times, yielded in the West, through the arid states, to the necessities of natural conditions. So the riparian doctrine has adjusted itself to conditions where it obtained. In some jurisdictions the law has been interpreted as requiring the water to go by practically unabated, in other jurisdictions it has been construed as permitting a reasonable amount to be withheld for purposes of irrigation; further, that the amount so withheld should depend on the size of the stream, the necessities of the situation, and other like conditions.

Evans vs. Merriweather, 3 Scan., 492, 495.
Irrigation Co. vs. Vivian, 74 Tex., 170.

If waters were confined for the purposes of irrigation to the watershed of the stream, the beneficial results from irrigation would frequently be destroyed, because fertile fields of extent can frequently only be reached by entering another watershed. Such conditions have caused the common law to

yield or to make it rather adapt itself as the winds and the atmosphere adapt themselves to the undulations of the earth, to the varied conditions it may find. All of the arid states—Colorado, Wyoming—permit these diversions to another watershed. Instances will be shown where Wyomnig is carrying water to other watersheds throughout the state, in fact, where she is even now diverting water from Colorado to another watershed within her state. She is not in a condition to complain that Colorado, being entitled to avail herself of a part of this water as one of her resources, cannot carry it wherever her laws and her natural conditions permit.

DISCUSSION OF THE FACTS.

In detail, the facts lend themselves to several specific subjects. Some of these are intimately co-related. Primarily, there is the question of water supply, and, in connection therewith, it is pertinent to discuss the amount of land which a given quantity of water will adequately irrigate, in other words, the duty of water, and the total amount of land under irrigation from the Laramie River and its tributaries. Further, the question of the relative priorities of diversions from the Laramie River in the two states, particularly the more recent projects; the question of the methods of administration of water and the methods of use; the question of interwatershed diversions and the productive value of the Wyoming area in controversy compared with the Colorado area which the defendants seek to reclaim by water from the Laramie River, and, ultimately, the broad question of equity between the two sovereign states in view of all the circumstances involved.

In the discussion of these various subjects, we wish, primarily, to establish the facts as disclosed by the testimony and then to draw our conclusions therefrom.

THE WATER SUPPLY.

The complainant seeks to restrain the State of Colorado. The Greeley-Poudre Irrigation District and The Laramie-Poudre Reservoirs & Irrigation Company from diverting water through a tunnel from the Laramie River into the Poudre River for the irrigation of 125,000 acres of land included within the Greeley-Poudre Irrigation District and lying in the watershed of the Poudre River outside and to the east of the mountains.

The Greeley-Poudre Irrigation District is a municipal or quasi-municipal corporation, organized under a general law of the State of Colorado permitting the formation of districts whereby the lands included are burdened by a system of taxation for the purpose of securing water for irrigation. The law permits the election of officers for the management of the affairs of the district by the owners of the land residing within the district, and the right of the district to issue bonds in order to acquire, by purchase or construction, necessary irrigation works and water for irrigation.

The third defendant, The Laramie-Poudre Reservoirs & Irrigation Company, is, so far as the present status of the case is concerned, merely the construction company, occupying a contractual relationship with the Greeley-Poudre Irrigation District for the construction of the irrigation works, although, at the outset, the Laramie-Poudre Reservoirs & Irrigation Company and its predecessors in interest were the real parties in interest in the diversion of the water from the Laramie River. A more detailed description of this relationship will be given later.

The measurement of water in running streams is not an exact science; although definite methods have been adopted by hydrographers and definite machines employed, nevertheless, it will readily be seen that flowing water, particularly in a swift current, does not lend itself to absolute accuracy of measurement. This is particularly true if it is sought to establish the normal flow of a stream from measurements or a series of measurements limited to one or two years or fractions of years. However, when records covering a number of years are known, it is possible to arrive at a fairly accurate determination of the normal flow of the stream. It will, of course, be recognized that any test of the amount of water flowing in the Laramie River must be based upon what appears to be the normal flow rather than upon the flow for any one particular year, inasmuch as the proposed diversion which is sought to be restrained will, unless enjoined, constitute a continuing diversion.

The Poudre River cannot supply the water necessary for the irrigation of the lands of the Greeley-Poudre District. This is almost self-evident when it is recalled that the defendants have gone to an enormous expense in the construction of a monumental engineering work, that is, the tunnel and collection ditches, in order to divert water from the Laramie into the Poudre, and also that other companies have similar works, notably, The Water Supply & Storage Company, operating in the Poudre Valley, has already constructed, at enormous expense, three interwatershed diversion ditches, one bringing water from the upper reaches of the Grand River across the Continental Divide into the Poudre, another bringing water

from the Michigan, a tributary of the North Platte, and the third bringing water from the Laramie River through the Sky Line canal into the Poudre; that another mutual irrigation company, The Mountain Supply Ditch Company, now merged into The North Poudre Irrigation Company, brings water from the Michigan, a tributary of the North Platte, into the Poudre, and the Divide Canal Company (Wilson Supply Ditch) diverts water from the upper reaches of Deadman, a tributary to the Laramie, into Sand Creek, thence into a tributary of the Poudre. In this cause none of these diversions other than the Greeley-Poudre project is attacked.

It is, however, proper to review the evidence as to the water supply in the Poudre and the demands thereon for irrigation in order to show, beyond a doubt, that there is not sufficient water in that stream for the irrigation of the Greeley-Poudre District.

Water Supply, Poudre River.

The evidence, as a whole, discloses that the Poudre Valley watered by irrigation from the Poudre River is an area of high agricultural development. This has been made possible solely by irrigation, and in this valley is probably found the highest development of irrigation in the United States. The demand for the necessary water for the irrigation of lands under the ditches has been so great that the result is a system whereby the administration of water has received scientific study and treatment. The administration of the officials of the state whose duty it is to police the streams and apportion the water to the various ditches is constant and definite. The methods of exchange whereby a ditch heading on the river in the upper portion of the area stores flood waters, which, during the irrigation season it releases for the use of an older ditch further down the river, and in turn takes the water otherwise unavailable, to which the older ditch would be entitled; the methods of exchange between reservoirs and the general community of interest in the valley show to anyone familiar with the situation that the area under primitive methods was short of water years ago and that a higher development and a greater reclamation of the lands within the valley has been accomplished because the need of water brought about better methods.

The evidence discloses that other ditches for projects other than the Greeley-Poudre project have been undertaken, with a view to and with the effect of enlarging the amount of water available in the Poudre River for the irrigation of this area.

The Water Supply & Storage Company, as has been definitely shown in the discussion of the subject of interwatershed diversions, built, not one, but three, ditches for the purpose of bringing water across the Continental Divide into the Poudre

River. Of these the third to be constructed was the Sky Line Ditch, diverting water from the Laramie River. It was commenced in 1891 and required three years to construct, although it is only five miles in length (2206). These ditches were constructed because the supply from the Poudre River was not sufficient for the needs of the water users under the main canal of the company known as the Larimer County Ditch (2205, 2213-2214).

The Mountain Supply Ditch Company built one, now belonging to the North Poudre Irrigation Company, and the Divide Canal Company built another.

It is obvious that the ditches and engineering works by which these interwatershed diversions were accomplished are of extraordinary cost. The expense is enormous. These four diversions were made at a date far earlier than the inception of the Greeley-Poudre project and have entailed the expenditure of probably hundreds of thousands of dollars, and when it is considered that the ordinary diversion and distribution systems from the Poudre River for the irrigation of the lands in the Poudre Valley have to be constructed and maintained in addition to these interwatershed diversion ditches in the mountains, in order that the water which is dropped into the Poudre River near the crest of the continent may be, at the proper place, taken from the river and applied to the land, there would seem to be no argument that the Poudre Valley was not short of water for the area already under irrigation exclusive of the Greeley-Poudre Irrigation District before the commencement of that later project. To argue otherwise would be to say that the users of water in the Poudre Valley had lost their senses and had spent vast sums of money for the construction of needless ditches.

Professor L. G. Carpenter made an investigation of the water supply available for the Greeley-Poudre Irrigation District in 1909 and 1910. That was before the filing of this suit. He made a report on this project, portions of which were introduced in evidence by the complainant in the course of the cross-examination of Professor Carpenter and a portion of this report is quoted in the testimony (3933), but in order that this report may be correctly understood, it must be borne in mind that the Greeley-Poudre system contemplates the construction of at least one large reservoir in the channel of the Poudre River in order that the peak flow of the flood waters which cannot be profitably intercepted by any ditch might be impounded. This plan is discussed elsewhere in the brief. Professor Carpenter, in his report, estimated that there was available in the Poudre River an average of 120,000 acre feet, but that this 120,000 acre feet cannot be diverted by the proposed system because of inability of the ditches to carry the full

amount of water which might be available for a very short length of time, but that the channel reservoir planned will be of material assistance and will lead to much better development of the system through exchange and through its ability to intercept the flood waters, and that in this way from 60,000 to 90,000 acre feet of Poudre water might become available for the use of the district within a few years (3936).

The total available water for the Greeley-Poudre District, according to Professor Carpenter's estimate in 1910, is summed up as follows: From the Laramie River, 70,100 acre feet; from the Poudre River, 60,000 and 90,000 acre feet; from Dowdy Lakes, that being a system of lakes lying in the mountains on the Poudre side which form part of the reservoir system of the district, 2,990 acre feet; from Douglas Reservoir, which is a reservoir already existing and in which the Greeley-Poudre district has an interest, 5,833 acre feet, and from flood waters of Lone Tree and Crow Creeks, from 3,000 to 10,000 acre feet, making a total of from 142,000 to 179,000 acre feet (3936).

It must be remembered that the 70,100 acre feet which the witness estimated to be available from the Laramie is measured at the tunnel and from that point it is subject to the loss by seepage and evaporation as it flows down through the canyon of the Poudre River to the headgate of the diversion ditch and to the loss by seepage and evaporation as it flows through the miles intervening between the headgate of the ditch and the lands of the district, and that all water from the Poudre River is likewise subject to the loss in transit from the head of the same ditch to the point of application.

The witness John R. Wortham, engineer for the Greeley-Poudre District, testified that the whole water supply obtainable from the several sources was necessary for the irrigation from year to year of the land within the Greeley-Poudre District (1708).

Under the law of the State of Colorado the Poudre River is subject to a demand for water when necessary to supply prior appropriations on the South Platte River below the mouth of the Poudre. That is to say, if the flow in the South Platte River below the mouth of the Poudre is not sufficient to supply the demands in that district, then the Poudre River must supply, in proportionate share with other tributary streams of the South Platte River, a sufficient quantity of water to furnish prior appropriations below. Accordingly, a junior appropriator on the Poudre may be compelled to relinquish his right to obtain water although it is available in the Poudre River, if it is necessary to supply an earlier appropriation on the South Platte. For this reason it sometimes happens that late appropriations on the Poudre are denied water because of a shortage on the main stream, so that in arriving at an estimate

of the quantity of water available from the Poudre River it is not possible to consider alone the normal flow of the Poudre River and the needs of the 300,000 acres of land irrigated in the Poudre Valley. The relationship of appropriators of water in Water District No. 3 of the State of Colorado, that is, the Poudre Valley, to the appropriators on the South Platte River below the mouth of the Poudre, must be considered. (3411.)

The normal yearly flow in the Poudre River, based upon a record of thirty years, is, according to Exhibit 123, 315,896 acre feet, measured at the mouth of the Poudre canyon, but in order to arrive at the normal flow of the Poudre River itself, there must be deducted from the amount measured at this point the amount of inflow from interwatershed diversions entering the Poudre, and there must be added the amount which is diverted by ditches above the gauging station, these being shown by Exhibit 124, and in order to get the total supply of the Poudre River, there must also be added inflow from some small tributary streams having some flood water flow, below the gauging station, making the average water supply of the Poudre River, in round numbers, 367,000 acre feet per annum (3410-3411).

A conclusion, therefore, based alone upon the fact that there is an annual water supply of 367,000 acre feet on the Poudre River, and that there is now under irrigation in the Poudre Valley, as will be shown later, exclusive of the lands in the Greeley-Poudre District, approximately 300,000 acres, and that the duty of water, measured at the land, including the use of the original and available seepage and return waters, is approximately one acre foot per acre, does not necessarily mean that the Poudre Valley allows 67,000 acre feet per annum to go to waste, and, even if it did, and assuming that this 67,000 acre feet per annum was available for the use of the Greeley-Poudre Irrigation District, nevertheless it alone would not be sufficient for the irrigation of the Greeley-Poudre District, which contains 125,000 acres.

Exhibits 123 and 124 were prepared by State Engineer John E. Field, based upon records in the office of the State Engineer, and the conclusion of the total water supply of 367,000 acre feet per annum on the Poudre is likewise Mr. Field's conclusion. Assuming 300,000 acre feet per annum necessary for the irrigation of the 300,000 acres of land in the Poudre Valley and assuming also that there will never be a demand on the Poudre for water for the South Platte, we then have 67,000 acre feet available for the use of the Greeley-Poudre District if it be possible to intercept it. It is noticeable that this corroborates Professor Carpenter's estimate that there is from 60,000 to 90,000 acre feet available. It probably shows also that Mr. Field, the State Engineer, was conservative in

his estimates. However that may be, the duty of water as established for the Poudre Valley as approximately one acre foot per acre prevails as the water is applied to the land, not according to measurement made at the head of the ditch. There is of necessity considerable loss in transit and we do not contend that one acre foot is the duty of water in the Poudre Valley measured at the headgate. However, it is significant that inasmuch as there seems to be an average of about 110,000 acre feet per annum, including original and seepage waters, passing out of the Poudre into the Platte (3411) of which probably fifty per cent is seepage water (see Exhibit 113 and testimony of John L. Armstrong, Water Commissioner, pages 2487-2498) and the balance original water, that the loss in transit in the ditches is almost exactly offset by the re-use or, in other words, the use of the seepage water available in the valley.

Witness Armstrong, who has been Water Commissioner of the District included in the Poudre Valley for a great many years and is thoroughly familiar with the supply and the demands, also testifies that the Greeley-Poudre Irrigation District could not depend for irrigation upon surplus water available from the Poudre River alone, and that in order to irrigate these lands it would be necessary to supplement the available Poudre Valley supply by water from the Laramie River (2494).

The primary need of the Poudre Valley, according to Charles R. Hedke, at one time an engineer for The Laramie Poudre Company, is and will be for all time in the future, the problem of securing water for its lands still unreclaimed (1735-1739).

Water Supply, Laramie River.

In discussing the question of the water supply of the Laramie River, it is necessary to understand something of the geography and topography of the watershed. As already stated, the stream has two branches which are particularly involved in this cause, the main branch commonly called the Laramie River and sometimes referred to as the Big Laramie, heads in Colorado; the other branch, called the Little Laramie, is entirely within the State of Wyoming. These two unite at a distance of approxmately twenty miles below the City of Laramie. The Big Laramie arises about twenty-seven miles in an air line south of the Wyoming-Colorado line, and during its entire course in the State of Colorado, flows in a general northerly direction through a narrow mountain valley at a very high altitude. This valley lies between two ranges of mountains forming the divides on the west between the Laramie River and the tributaries of the North Platte, and on the east between

the Laramie and the tributaries of the Poudre. By actual measurement, the amount of land irrigated in the Laramie Valley in Colorado from this river and its tributaries is 4,250 acres (Ex. 130). The agriculture in this area is confined to the production of native hay. These irrigated lands are a thread along the river and at no point is the water diverted any considerable distance from the channel. The ditches by which this diversion is made comply with the law of Colorado and have received decrees adjudicating their rights. They are not attacked in this proceeding.

The consumptive use of this water is slight, owing to the topography of the country and the proximity of the application to the stream (3460), and in the conclusions made by the hydrographers for both complainant and defendants, no charge is made against the flow of the stream for this use. In other words, this use is not considered in the determination of the flow of the stream, and may be eliminated. The same condition is true both as to the general character of the country, the kind and character of the agriculture and the application of water and also as to the charge against the flow of the stream, on the upper reaches of the Little Laramie River, generally referred to as the Centennial Valley. In other words, on both streams in both states the consumptive use for irrigation in the mountain regions near the sources of the streams has been eliminated from consideration in so far as the measurements of the two streams are concerned, and the measurements have been taken and considered as though no such diversions existed.

Returning now to the Laramie River, at a point about nine miles north of the Wyoming-Colorado line, the river emerges from the mountain valley and enters the Laramie Plains. From this point the mountain ranges or divides referred to diverge, forming the Laramie Plains, a high mountain plateau surrounded on three sides by mountain ranges. At this point also irrigation in a material way commences, everything above this point being of the character described.

In this Laramie Plains area there are a number of old ditches diverting water both from the Big Laramie and the Little Laramie, the largest of which is the Pioneer Canal, dating from 1879, most of the irrigation, however, being above the junction of the two streams. Below the junction, the river continues its northerly flow for a distance in an air line of about thirty miles and then, for the first time in its course, cuts through a mountain range, flowing in a northeasterly direction until it reaches the North Platte at the site of the historical post known as Fort Laramie. Fort Laramie and Laramie City are to be distinguished. After the river passes through this mountain range and enters the plains country, it traverses the northerly

edge of an agricultural district generally known as the Wheatland District.

The average elevation of the Laramie Plains is about 7,000 feet, while the average elevation of the Wheatland area is about 4,700 feet above sea level.

The natural conditions divide the irrigated districts on this watershed into that inside of the mountains on the Laramie Plains and that on the outside, the Wheatland area.

The controversy here does not so much involve these older ditches on the Laramie Plains above mentioned as it does some newer projects, and in this connection it is necessary to keep in mind three reservoirs which have a material bearing upon the question, these reservoirs being of great capacity, two of them at any rate being far above the average capacity of reservoirs and many times larger than any reservoirs in the Poudre Valley. The first of these is Lake Hattie, a material factor in the project of the Laramie Water Company. Its intake from the river is an enlargement of the upper portion of the Pioneer Canal. It has a total capacity, according to the testimony of Lyman E. Bishop, an engineer employed in its construction, who testified in behalf of the State of Wyoming, of 110,500 acre feet, of which amount 68,500 is available to be withdrawn from the reservoir, while 42,000 acre feet is dead water which cannot be withdrawn under the present circumstances, but which could be withdrawn, at least in part, by the construction of a cut between two natural basins upon which the reservoir is constructed (786, 787). Lake Hattie also has an intake from the Little Laramie River.

The next reservoir is Lake James, the source of supply of which is the Little Laramie River, Four Mile, Seven Mile and Mill Creeks, the last three being small creeks. Lake James has a capacity, according to Wyoming testimony, of 41,100 acre feet (632).

The third reservoir is the Wheatland Reservoir No. 2, usually referred to as the Wheatland Reservoir. This reservoir is located on the Laramie Plains, just above the canyon in which the river passes through the mountains. It is to be distinguished from Wheatland Reservoir No. 1, which is a smaller reservoir located near the center of the Wheatland tract. This Wheatland Reservoir No. 2, or Wheatland Reservoir, is what is termed a channel reservoir, that is to say, it is formed by the construction of a dam across the channel of the river and is of material significance on this account as will be shown later. It is very large, having a capacity of 126,000 acre feet according to the testimony introduced by the State of Wyoming, the witness being M. R. Johnson, for many years the manager of the company owning the Wheatland system, he testifying to that capacity as determined by a survey made under his supervision

(6, 60). This also appears to be the capacity shown by the filings made in the office of the State Engineer of Wyoming, although the complainant later, over the objection of defendants, attempted to contradict this testimony by its witness R. I. Meeker, an engineer and hydrographer employed by The Laramie Water Company, the owner of Lake Hattie, it appearing from the testimony that a controversy had heretofore existed between the Lake Hattie people and the Wheatland Company relative to the capacity of the Wheatland Reservoir. Meeker's testimony places the capacity of this reservoir at 83,400 acre feet (4309).

A glance at the map, Exhibit 1, attached to the answer of the defendants, The Greeley-Poudre Irrigation District and The Laramie-Poudre Reservoirs & Irrigation Company, will show that the Laramie River throughout its course in Colorado and through the Laramie Plains, flows parallel to and between the two ranges of mountains before mentioned, the enlarged valley between these two ranges constituting the Laramie Plains. The range on the west side of the river is known as the Medicine Bow Range, although in Wyoming at the head of the Little Laramie River the mountains are frequently termed the Centennial Mountains. The range on the east is known in Colorado as the Green Mountains and in Wyoming as the Laramie Mountains and the Black Hills. It is also to be noticed that throughout this portion of the watershed, the greatest inflow, as indicated by the tributary streams, is from the west, that is, from the Medicine Bow Range. The largest of these tributaries is the Little Laramie River.

It is the contention of Wyoming that their water supply from this range is inferior to that of Colorado, and inasmuch as Colorado will divert water from the main stream by means of the Greeley-Poudre tunnel, they will have an insufficient quantity of water. Later we will have occasion to show the relatively small proportion of the flow of the stream in Colorado which can be taken through the tunnel and the relatively small area of the drainage which will contribute to that supply.

In order to meet this contention and also to supplement measurements of the stream flow, measurements of the depth of the snow along this divide to the west, that is, the Medicine Bow Mountains, were taken. This was, because of the nature of country, a very perilous undertaking. A very graphic representation of the snow conditions along this divide is made through a number of photographs introduced by the defendants herein (Ex. 156). It is impossible to describe the snow conditions as adequately as these pictures show them. We therefore earnestly urge an inspection of this exhibit. There are some thirty photographs in the exhibit, with a legend giving the date upon which each picture was taken and the location of the

scene. These pictures were taken under the supervision of Professor L. G. Carpenter, an engineer of known ability, in order to supplement his investigation of the supply of water through stream measurements. In making these snow measurements, two hundred or more observations of the depth of the snow were taken and the quantity of water determined by measurements from time to time (3823).

The two ranges above mentioned converge at the head waters of the Laramie. In that vicinity the highest peaks in the mountain sheds contributing to the Laramie River are situated, but the Medicine Bow Range is narrower in Colorado than it is in Wyoming, so that while Colorado has possibly a higher average elevation for the range, that is in a measure offset by the greater breadth of the watershed in Wyoming. The lowest portion of the range is apparently near the line between the two states, the elevation decreasing from the head waters of the Laramie northward to this lower portion and then increasing again toward the area at the head waters of the Little Laramie where the elevation is again very high, Medicine Bow Peak, sometimes called Centennial Peak, having an altitude in excess of 12,000 feet, whereas the highest peak in the Colorado watershed is Clark's Peak with an elevation slightly in excess of 13,000 feet (3816-3823). The conclusion is irresistible that no marked difference exists in the precipitation along this divide between the Colorado area and the Wyoming area.

The range of mountains to the east of the Laramie River is not as high as the range to the west and there is much less precipitation and consequently less run-off from it, although one tributary of the river (Sand Creek) which is of considerable importance to this cause arises on this range in Colorado and flows almost due north into Wyoming, joining the Laramie River about nine miles above the City of Laramie. There are also tributaries to the river from the watershed on the east side of this range, these tributaries all converging near Wheatland, Wyoming. The principal ones are the North Laramie, the Sybille and the Chugwater. It is to be noted that all of the water of these three streams and also that of the Little Laramie and various other small tributaries of the river originate within the territorial limits of the State of Wyoming.

The total drainage area of the Laramie River and its tributaries, as has been stated, is 4,076 square miles, and of this a total of 393 square miles is in Colorado, 312 being in the drainage area above the state line on the Laramie River itself and 81 on Sand Creek.

The complainant, in connection with the testimony of its hydrographer, Mr. R. I. Meeker, introduced in evidence Exhibit C, being a small map indicating various points upon the stream and some of its tributaries at which gauging stations

for measurements were made. It is noticeable, however, that these gauging stations so indicated are for the year 1912 only and the exhibit in no wise indicates all of the stations which have been maintained in other years. As a matter of fact, it will be observed later that the Wyoming hydrographer bases his conclusions as to the normal flow of the stream almost completely upon measurements taken during a portion of the years 1912 and 1913 (on rebuttal modified by some measurements made in 1914), whereas the conclusions reached by the Colorado experts are based upon an analysis of the measurements made through a very much longer period.

In order that the court may understand the geographic location of the various stations, it is well at this time to describe the locations where measurements have been taken and testified to. Measurements have been made of the diversions through the Sky Line Canal and the Wilson Supply or Divide Canal; then upon the river itself, the highest station on the stream is at the Lanning Bridge, a short distance below the Greeley-Poudre tunnel; next at Glendevey, some nine miles below the tunnel; at Decker's Ranch, immediately above the Colorado-Wyoming line, and then at Boswells, immediately at the state line, these last two stations being only about a mile apart. Measurements were also made on various tributary streams in Colorado. Then in Wyoming measurements were made for a number of years at Woods Landing, which is the point above referred to where the river emerges from the mountains on to the Laramie Plains. Mr. Meeker, the Wyoming hydrographer, also took measurements, as shown by his exhibits and his testimony, at the head of the Pioneer canal, about four or five miles below Woods Landing. This is termed the Pioneer Dam. Measurements were also made upon the Big Laramie immediately above the junction of the Big and Little Laramies at a point called Two Rivers.

Passing now to the Little Laramie, measurements were taken at several places near the point where the stream emerges from the mountains on to the plains area, these being Filmore or Wright's Ranch, Hatton and May's Ranch. Mr. Meeker took measurements in 1912 and 1913 at the head of the Lake Hattie inlet from the Little Laramie, commonly referred to as No. 2 dam, but which is to be distinguished from the dam of the Wheatland Reservoir No. 2, and measurements were also taken on the Little Laramie immediately above its junction with the Big Laramie, this point also being termed Two Rivers. Another station maintained by Mr. Meeker and possibly others was immediately above the Wheatland Reservoir. This station is usually termed Lookout, although at times referred to as the Steel Bridge. Measurements have also been taken and are referred to at McGill, which is a short distance below the

Wheatland Reservoir but above the canon of the river, also at Wheeler's Bridge, which is below the canon. Measurements were also taken on Sybille Creek, on Chugwater and on the main stream at Uva, that being below all tributary streams except the Chugwater.

These measurements were not all taken by the same authority, nor at the same times, but, generally speaking, four authorities either co-operated or made separate measurements, they being the United States Geological Survey, the State of Wyoming, the State of Colorado, and The Laramie Water Company, through the hydrographer mentioned, Mr. Meeker.

Four witnesses testified to the flow of water in the Laramie River; one for Wyoming, Mr. R. I. Meeker, hydrographer for The Laramie Water Company, and three for Colorado, Mr. John E. Field, State Engineer of Colorado, Professor L. G. Carpenter and Mr. Charles R. Hedke.

One very important question is the amount of water supplied to the Laramie River by the State of Colorado, not alone the water flowing in the main stream at the state line, but also that contributed by tributary streams arising within the State of Colorado.

It is not advisable at this time to attempt any comparison of ability between witnesses for Colorado and the witness for Wyoming on this question. We will concede that Mr. Meeker was painstaking and conscientious. As stated before, however, his conclusions are based almost wholly upon measurements made during the years 1912 and 1913, as shown by his exhibits. On the other hand, Professor Carpenter, who is a recognized authority on matters of irrigation in the western states, bases his conclusions upon measurements made through a series of years by the State of Colorado, State of Wyoming and the United States Geological Survey, supplemented by measurements made by himself personally or under his immediate supervision, together with his general investigation of the whole country tributary to the Laramie River, including the snow measurements before mentioned. Mr. Field, as the evidence discloses, had had a wide experience as an irrigation engineer; had made investigations of the Laramie River in behalf of the United States Reclamation Service, with which bureau he had at one time been identified, and, as State Engineer of Colorado, had occasion to supervise measurements made in behalf of the state. His conclusions are reached after a complete analysis of all records at the various stations mentioned in the testimony. Mr. Hedke, as engineer for The Laramie-Poudre Reservoirs & Irrigation Company, had not only co-operated with Professor Carpenter to some extent, but had made an independent investigation of the water supply of the Laramie River

and the amount available through the tunnel for the Greeley-Poudre District.

It is conceded by the State of Colorado that the average annual diversion from the Laramie River by the Sky Line Ditch will probably amount to 16,000 acre feet per annum, while the average annual diversion by the Wilson Supply or Divide Canal will be about 4,000 acre feet per annum, making an aggregate of 20,000 acre feet as the average annual amount of water now diverted from the Laramie River by means of these two interwatershed diversion systems, and in determining the average annual flow of water from the Colorado area, this amount, 20,000 acre feet, must be taken into consideration. Some of the estimates of the flow at the state line include, while others exclude this amount.

Professor Carpenter testifies that the average run-off from the Colorado area, excluding the 20,000 acre feet through the Sky Line and Divide Ditches, is in excess of 300,000 acre feet per annum (3956). Adding to his estimated flow the Sky Line and Divide diversions, we have therefore a gross amount in excess of 320,000 acre feet per annum.

Mr. Hedke testified that, according to his investigation, there was an average amount of 70,000 acre feet available through the Greeley-Poudre system at the tunnel, that being about one-fourth of the total flow of the river at the state line (1823, 1852). Therefore his estimate is 280,000 acre feet net at the state line, excluding the Sky Line and Divide diversions, or a total of 300,000 acre feet.

Mr. Field, after making a thorough analysis of all records and measurements of the Laramie River, including the measurements made by the State of Colorado, the State of Wyoming, the United States Geological Survvey, measurements made by Professor Carpenter and certain unpublished records furnished by the State Engineer of Wyoming and others furnished by Mr. Meeker during the course of his cross-examination, reaches what he testifies to be a very conservative conclusion that the average flow at the state line, including the Sky Line and Divide diversions, will exceed 250,000 acre feet per annum (3477).

The complainant attempted no conclusion of this question until the introduction of its evidence in rebuttal, whereupon Mr. Meeker, as a summation of his evidence in this regard, estimates the average annual run-off at Woods Landing to be 200,000 acre feet per annum (4296). While Woods Landing is some nine miles north of the state line, and the flow at that point includes some Wyoming water entering the stream below the state line, nevertheless Mr. Meeker made no allowance whatsoever for any flow from Colorado into Wyoming through the

tributary stream Sand Creek, which is estimated by Mr. Field to be 17,000 acre feet per annum, and which probably more than offsets the Wyoming water entering the stream between the state line and Woods Landing. An analysis of Mr. Meeker's evidence discloses that this amount, 200,000 acre feet, is the net amount after deducting the Sky Line and Divide diversions. He did not testify to the amount of the Sky Line and Divide diversions, so, accepting the defendants' evidence upon this point, it means that Meeker's estimate of the Colorado run-off is approximately 220,000 acre feet per annum.

For the sake of clarity, let us tabulate the testimony of these four witnesses, showing the average gross amount of the annual flow at the Colorado-Wyoming line:

Professor Carpenter	320,000 acre feet
Charles R. Hedke	300,000 acre feet
John E. Field	250,000 acre feet
R. I. Meeker	220,000 acre feet

The methods by which these conclusions were reached are based upon so many and varied measurements and engineering calculations that we recognize a decided difficulty in making a brief statement that will fully explain them all. Probably nothing short of an anaysis of the evidence would suffice to make clear the processes by which the conclusions were reached, and we fear that the matter is so technical that it is rather a subject for the labor of a hydrographer than for a lawyer. Probably the conclusions themselves will, after all, be the most valuable to the court in determining the facts. However, we will attempt a brief review of the evidence, taking first the evidence of Mr. Meeker, who testified in this behalf for Wyoming.

Early in the presentation of the evidence in behalf of complainant, Mr. Meeker testified and produced a table introduced as Exhibit B, purporting to give the run-off of the Laramie River at the Pioneer Dam, which, as heretofore stated, is a short distance below Woods Landing. Mr. Meeker, according to his own testimony, while he had had considerable experience in hydrographic matters prior to his employment by the Laramie Water Company, had nevertheless been engaged in hydrographic investigation on the Laramie River only since May, 1912 (218). He testified the first time on August 22, 1913, so that his experience and observations on the Laramie River were limited to the period between those dates. His Exhibit B purports to show the run-off at the point indicated, based upon measurements made by himself from April to December, inclusive, 1912, and from January to August 18, 1913. While there were many records in existence of the flow of the

Laramie River at the time Mr. Meeker commenced his measurements, taken in some instances by the United States Geological Survey and in others by the State of Wyoming through the State Engineer's department and by the State of Colorado through its State Engineer's department, nevertheless Mr. Meeker did not see fit to include them in his table. He seems to have had either a lack of confidence in the measurements made by other hydrographers or a desire to discard them for the possible reason that they show a greater discharge than he found, but, at the same time, he evinces supreme confidence in his own measurements, although his confidence was possibly shaken before the conclusion of the testimony, judging from the number of errors which he admitted and the number of changes which he made. According to his table, Exhibit B, he found that the discharge of the Laramie River from April to December, 1912, amounted to 198,867 acre feet, and from January to August, 1913, 95,682 acre feet, these measurements being shown for the respective months covered. From these he endeavored to establish a mean, although such a mean must have been based upon one record for the months of September, October, November and December, 1912, and the months of January, February and March, 1913, and for the months of April, May, June, July and August, his mean is based upon the records for the two years. His total mean discharge for the year was then given at 160,498 acre feet. This is obviously too limited a period from which to establish a mean which would represent the average discharge of the stream. This is particularly true in view of the admitted fact that the year 1913 was one of extremely low precipitation and the run-off of the streams correspondingly low:

On this same table Mr. Meeker makes an estimate of the total flow for 1912, based upon the records for that year for the months designated and an estimate of the flow for the months not measured, in the total amount of 207,000 acre feet, and he seeks to show the distribution of that water from the point of measurement as follows: To the Pioneer Canal, 17,703 acre feet; into Lake Hattie Reservoir, 69,855 acre feet, and by referring to another table produced by the same witness, Exhibit K, we learn that the Lake Hattie commenced storing on April 8, 1912, and continued until October 5, 1912. Apparently they again recommended, because he notes that they ceased a second time on December 26, 1912. It is noticeable that water was being stored during the entire irrigation season. He then finds that there was distributed to all the ditches between the Pioneer Dam, the point of his measurements, and Two Rivers, the junction of the Big and Little Laramies, the further sum of 29,892 acre feet, and that there was distributed to the Wheatland Reservoir and any ditches diverting water between Two Rivers

and the Wheatland Reservoir, 89,550 acre feet, making up his total of 207,600 acre feet, and thereby balancing with the estimated flow at Pioneer Dam. It is noticeable that inasmuch as there are three or possibly four ditches diverting water between Two Rivers and the Wheatland Reservoir, only one of which is of any considerable size, and assuming the correctness of Mr. Meeker's figures, probably the greater portion of this 89,550 acre feet which he distributes to the intermediate ditches below Two Rivers, to the Wheatland Reservoir, found its way into Wheatland Reservoir. This, of course, does not include any other water than that flowing in the Big Laramie as counterdistinguished from the Little Laramie and other tributary streams below the Pioneer Dam.

For the year 1913, Mr. Meeker does not attempt an estimate for the full year, but confines himself to a statement limited to the amount shown by his measurements for that year, that is, 95,682 acre feet, which he distributes as follows, for that period: Pioneer Canal, 10,983 acre feet; Lake Hattie Reservoir, 28,470 acre feet. Referring again to Exhibit K, we find that the storage commenced from the Big Laramie in this reservoir April 25, 1913, and ceased on June 13, 1913. Following the same plan for showing distribution, he charges to all the ditches between the Pioneer Dam and Two Rivers, 18,167 acre feet, and to Wheatland Reservoir and intermediate ditches below Two Rivers, the sum of 38,062 acre feet. It is to be remembered that this table, Exhibit B, and the foregoing figures refer to water from the Big Laramie River only.

At a later date, November 13, 1913, and before the complainant rested its case, Mr. Meeker produced a second table similar to Exhibit B, introduced as Exhibit I (1035), which continues his measurements for the year 1913 to and including the 15th of November, increasing, however, two of his former monthly discharge records, Exhibit B, giving a discharge for July, 1913, of 6,764 acre feet while on Exhibit I he gives it as 6,825 acre feet, and for August, 1913, Exhibit B gives 3,038 acre feet while Exhibit I gives it 3,130 acre feet. He maintains his estimate of the flow and the distribution for the year 1912 as given before, but modifies his 1913 distribution to meet the enlarged flow coming from his longer record, and at the same time, endeavors to strike a mean based still upon his experience for a portion of the two years, 1912 and 1913, but with the enlarged experience of additional measurements for September, October and November, 1913. In this connection it is noticeable that inasmuch as 1913 showed a flow very much less than 1912, he reduces his mean from 160,498 to 158,206 acre feet.

Let us merely call attention at this time to the fact that Mr. Meeker, testifying in rebuttal, later modified this table a

third time, Exhibit T-7, and then was compelled, upon cross-examination, to correct it again (4322). This will be considered later.

He adopted the same method of treatment for the Little Laramie River, Exhibit J, establishing a mean upon records for the months of June to December, inclusive, 1912, and January to November, inclusive, 1913. In this table he finds the mean to be 68,727 acre feet. The measurements were made at the head of Lake Hattie Supply Canal No. 2 dam, that being a short distance below the station known as Filmore but below the diversion made through the Bellamy Canal, the intake to Lake James Reservoir, and also below the Loback canal. In this exhibit he estimates the total run-off for the year, 1912, at No. 2 dam, including the amount diverted by the Bellamy canal but excluding the Loback canal, to be 93,667 acre feet, which he distributes as follows: Bellamy Canal and James Lake Reservoir, 24,793; Lake Hattie Supply Canal No. 2, that being the name of the inlet from the Little Laramie to Lake Hattie, 14,053 acre feet; to the ditches between No. 2 dam and Two Rivers, 17,245 acre feet, and below Two Rivers to the intermediate ditches and Wheatland Reservoir, 37,556 acre feet.

We find, Exhibit K, that storage in Lake James from the Little Laramie commenced about April 21, 1912, and ceased about August 3, 1912, and that storage from the Little Laramie River in Lake Hattie Reservoir commenced about June 4, 1912, and ceased August 10, 1912.

Based upon his eleven months record for 1913, and adding the amount charged to the Bellamy Canal, he estimates the total discharge for the year as 58,361 acre feet, distributing to the Bellamy Canal and Lake James 12,310 acre feet; nothing to Lake Hattie from the Little Laramie in 1913, but to the ditches between this point of measurement and Two Rivers, 22,254 acre feet and to Wheatland Reservoir and the intermediate ditches below Two Rivers, 23,397 acre feet. It must be borne in mind that the mean referred to in this table does not include the amount of water diverted by the Bellamy Canal; contended for by Mr. Meeker.
that would have to be added to get the total amount even as

Exhibit J was superseded by Exhibit T-8, introduced when Mr. Meeker was called by the complainant in rebuttal. It purports to give full measurements for the year 1913, and for the months of January, February, March, April and May, 1914. Having his full record for the year, 1913, he increases his total flow for that year from 58,361, estimated from eleven months record (Exhibit J), to 59,637 acre feet.

It is to be noted that these tables charge nothing against the diversions made above the points of measurement, in other words, in Exhibit B, I and T-7, the measurements refer to the

flow of the Laramie River at the Pioneer Dam and do not include water diverted above that point. This exclusion covers whatever irrigation there may be in Wyoming above that point and also the irrigation on the Laramie Valley in Colorado, together with the diversions through the Sky Line and the Divide Canal or Wilson Supply, these last two diversions being 20,000 acre feet per annum as an average. The exhibits referring to the Little Laramie, that is J and T-8, show the measurement of water flowing in the Little Laramie after diversions for the irrigation of the Centennial Valley, and diversions by the Loback canal have been made. Attention is directed at this time to the fact that while Mr. Meeker made no charge against the Little Laramie River for this irrigation, he nevertheless did include this Centennial Valley land so irrigated in his estimate of the total amount of land irrigated in the Little Laramie Valley (Exhibit E), which will be referred to later. We contend that inasmuch as he neglected to charge anything for the irrigation of these lands, this plan being consistent with that adopted by Colorado with respect to the lands irrigated in the valley of the Big Laramie in Colorado, that he ought not to attempt to include this land in his list of irrigated acreage depending for irrigation upon the Little Laramie River. We merely make this statement at this time to show the inconsistency of his position in this regard.

Mr. Meeker adhered with remarkable tenacity to these tables, Exhibits B, I and T-7, as the basic data for his conclusion above referred to that the average flow of the Laramie River at Woods Landing was 200,000 acre feet per year.

Mr. Field, in his testimony, in order to arrive as nearly as possible at a normal yearly precipitation, went to the Poudre River where he had a series of records covering a period of over 30 years, on the theory that an average could be more accurately arrived at from 30 years' records than from the records of a materially less number of years upon the Laramie. He found, as will hereafter be specified, that the year, 1912, was very slightly in excess of normal. Mr. Meeker, following the same idea, went to a more remote stream, that is, more remote in so far as the point and conditions of observations were concerned, that is, to the North Platte River, and taking the records of the United States Geological Survey at Saratoga, which was admittedly below all irrigation in North Park in Colorado, a very considerable amount, for eight years between 1903 and 1913, inclusive, determines that for the North Platte River at that station, the year 1912 was 115.5 per cent of normal, Exhibit T-9, and he argues from that that the year 1912 was approximately 115.5 per cent of normal for the Big Laramie River.

The complainant introduced no measurements or records of the stream flow other than those of Mr. Meeker, although in

rebuttal, when Mr. Meeker concluded that the normal yearly run-off at Woods Landing was 200,000 acre feet, he contended that he had reviewed other records, but these were neither produced nor were we told of what they consisted.

Contending that the year 1912 was 115.5 per cent of normal, he finds 207,000 acre feet, in round numbers, passing the Pioneer Dam on the Laramie River, based upon gaugings made at that station. However, there had been diverted above, the water taken by the Sky Line and Divide Ditches in Colorado, which, as explained, will amount to 20,000 acre feet per annum as an average. As a matter of fact, they happened to be slightly above the average in the year 1912. As shown by Exhibit 124, they were 20,986 for the Sky Line and 2,157 for the Divide, or a total of 23,143 acre feet. This amount, if added to Meeker's 207,000 acre feet at the Pioneer Dam, would make a total of 230,143 acre feet. This is stated to show that Meeker's estimate of an average flow of 200,000 acre feet per annum is the net flow rather than the gross at Woods Landing.

As will be shown later, the diversions which can be made through the Greeley-Poudre tunnel, according to Mr. Field's estimate of the water supply, which is larger than Mr. Meeker's estimate, will be 56,000 acre feet per annum. This is based upon the Greeley-Poudre system as planned and partially constructed. Therefore, according to Meeker's estimated net flow, the Colorado diversion sought to be enjoined would be 56/200ths of the net amount of water in the Laramie River after the Sky Line and Divide Diversions have been supplied. There is a possibility of an enlargement of the Greeley-Poudre system by the extension of one of the collection ditches to McIntyre Creek. This, it is estimated, would give an additional 15,000 acre feet through the tunnel. While this is not planned as part of the Greeley-Poudre system, it is possible, and if ever constructed, it will enable Colorado to take 71/200ths of the net flow as Mr. Meeker finds the net flow at Woods Landing after the Sky Line and Divide Ditches are supplied.

It will be shown elsewhere that the evidence discloses that this is the ultimate possible diversion under any known engineering, permissible from the standpoint of the cost in relation to the returns therefrom that can be made from the Laramie River for use in Colorado.

The complainant offered no evidence of the total water supply of the whole Laramie River drainage area, but did criticise, in some particulars, testimony adduced by the defendants in this regard.

An analysis of Mr. Field's testimony on this point shows, first, a record of flow at a station termed Glendevey, which is about nine miles immediately below the tunnel of the Greeley-Poudre system and about fifteen miles in an air line above the

Colorado-Wyoming line. This station is below the diversions made by the Sky Line Ditch and the Divide Canal and is also below all contemplated diversion by the Greeley-Poudre system, but not below a possible extension of the system, that is, it is below all the diversions which are now planned, estimated by Mr. Field at 56,000 acre feet a year, but it is not below the extra possible and ultimate diversion of 15,000 acre feet. This record is shown by Exhibit 125, and covers partial records for the respective months in the years 1904 and 1905 and the years 1910 to 1913, inclusive. There are no records for the month of December in any one of these years, but by making an estimate for the mean December flow, the mean yearly flow at this station amounts to 65,717 acre feet. This does not include the water diverted by the Sky Line Canal and the Divide Ditch, in other words, it is the net amount of the flow of the river after these diversions are deducted and eliminating the small diversions for irrigation above that point in the valley of the Laramie River itself (3419). The table gives the total drainage area of the stream above this point as 102 square miles, and this net mean annual flow would indicate a run-off of 12 inches in depth over this watershed. If to the mean yearly flow above given the diversions by the Sky Line Canal alone were added, the total would be 83,790 acre feet, indicating a depth of run-off for the watershed of 15.4 inches, and if to this were added the diversion through Sand Creek (the Divide or Wilson Supply ditch), the total would be approximately 86,150 acre feet or run-off to the depth of 15.8 inches.

The drainage area mentioned, being the head waters of the Laramie River in Colorado, is immediately adjacent to the upper drainage area of the Poudre; in fact, the small tributaries are interlaced. Using the Poudre records before mentioned, covering a period of thirty years, for the purpose of determining the normal yearly run-off, Mr. Field concludes (3422) that the years covered by this table (Exhibit 125) in combination, give an average of 87 per cent of normal. If normal were based upon the records at Woods Landing on the Laramie River, to which reference will hereafter be made, but which cover a less number of years than the Poudre records, it would be 84.5 per cent of normal. Assuming the larger percentage, however, Mr. Field's statement is that the normal run-off at Glendevey would be 77,000 acre feet instead of 65,717 acre feet, this, again, being the net after the deduction of the Sky Line and Divide Canal waters (3422).

The witness arrives at this estimated normal by another method. 1912 is approximately normal according to the Poudre flow. The table, Exhibit 125, covers measurements made throughout the year 1912 with the exception of December. Estimating the run-off for the month of December to be 1,050 acre

feet, the run-off for that year would be 76,000 acre feet, or only 1,000 acre feet less for the year than the amount arrived at by the other method.

While it is our desire at this time to discuss the evidence relative to the flow of the Laramie River to the exclusion of other questions, it is, nevertheless, of particular interest while we have under consideration the Glendevey station, to consider the amount of water flowing in the river at that point which can be diverted by means of the inter-watershed diversions above. The records indicate that the Sky Line Canal is able to divert about 71½ per cent of the total supply furnished by the watershed above that ditch (3423), and that the Greeley-Poudre system will probably not be more efficient, although it will be able to divert the winter flow in the stream itself at the tunnel, differing in this respect from the Sky Line Ditch, which cannot, because of ice, operate during the winter months. This winter flow at the mouth of the tunnel is estimated at ten cubic feet per second. The collection ditches of the Greeley-Poudre system, based upon the experience of the Sky Line Canal, will not be able to operate during the winter, but, because of the ability to divert the ten cubic feet per second through the tunnel during the winter months, the Greeley-Poudre system will probably be able to divert 74 per cent of the net amount of water passing Glendevey, or approximately 56,000 acre feet per annum (3424). Adding now the amount which might be acquired by the possible extension of the system to the lower McIntyre, a tributary which reaches the stream below Glendevey, an additional 15,000 acre feet might be acquired (3425). This would give the total ultimate development of the Greeley-Poudre 71,000 acre feet instead of 56,000 acre feet, and by adding the 20,000 acre feet already diverted annually by the Sky Line and Divide Canals, we get the ultimate possible figure of 91,000 acre feet per annum, but a probable diversion of 76,000 acre feet per annum, which is the amount of water out of the total amount furnished by Colorado which the State of Colorado or its people can use from that stream.

Professor Carpenter estimated the total flow of the Laramie River at the state line to be in excess of 320,000 acre feet per annum. His estimate of the amount which can be diverted through the Greeley-Poudre system as planned is 70,100 acre feet, but the percentage of the total, as we will hereafter show, is identically the same as established by Mr. Field.

It is also of interest in discussing the stream measurements at Glendevey to call attention to the small amount of the drainage area which can be intercepted by the Sky Line Ditch and also by the Greeley-Poudre system. On the map attached to the answer of the corporate defendants, Exhibit 1, the drainage area which can be intercepted by the Sky Line is colored yellow

and is noted upon the exhibit as being 15½ square miles. The drainage area which can be intercepted by the Greeley-Poudre system is colored purple and is noted as 68 square miles. This was later modified slightly and was given as 63.5 square miles for the Greeley-Poudre system (1398), out of a total of 393 square miles constituting the drainage area of the Laramie River and its tributaries, including Sand Creek, within the State of Colorado.

The next station on the river at which measurements were maintained was at Decker's in Colorado, about half a mile south of the state line, and then at Boswell's in Wyoming, immediately to the north of the state line. These two stations were supposed to be the same, but a tributary stream called Stuck Creek, of considerable size, enters between the two. The court will, of course, notice that between the Glendevey station and the Decker station there are a number of tributaries into the river, among them McIntyre Creek, La Garde, Laramie Creek and Grace Creek from the west and Jimmy Creek and others not named upon the map from the east. Of all of these, the McIntyre is the largest.

Exhibit 126 gives a series of records at these two stations for part of the months of 1904, 1905, 1906 and 1908 at Decker station, and 1911, 1912 and 1913 at Boswell's station. Inasmuch as these records shown by the Exhibit 126 are published records, some being from the United States Geological Survey and some from the reports of the State Engineer of Colorado, it was thought well to refer to them in the evidence, but, as an indication of the total flow of the stream, they were deficient. This will be explained later, but the records are of interest as showing the amount of water in the stream, subject to this error, which, when known, merely confirms Mr. Field's conclusions.

The two records on Exhibit 126, that is, those for the years 1904, 5, 6 and 8 at Decker's, and 1911, 12 and 13 at Boswell's ranch (state line), are considered as one record by Mr. Field in his treatment of this exhibit, making an allowance for the inflow from Stuck Creek between the two stations, which, upon measurements made in 1912 by Prof. L. G. Carpenter and by hydrographers from the State Engineer's office of the State of Colorado in 1913, he estimates to be 9,000 acre feet per annum. It will be noticed that no measurement is complete for any one of the years mentioned.

In determining the percentage of normal for the years covered by the Decker Station, we have to go to the Poudre, inasmuch as there were no records at Woods Landing for those years. (3431) However, the percentages for the three records covered by the Boswell record, that is, 1911, 12 and 13, can be based upon either the Poudre or the Woods Landing (Laramie) records, and if a normal were estimated upon either

the Poudre or Woods Landing basis, based upon this discharge table for the limited number of months for each of the years given, the normal flow for the periods indicated would be 155,000 acre feet, exclusive of the diversions from the Laramie River into the Poudre River through the two canals mentioned, an average of 20,000 acre feet. It must be borne in mind, however, that this is not and does not purport to be a full year's record nor an estimate for a full year. On the same basis, in order to determine the amount of Colorado water at this point, there must be added the portion of the water of two tributary streams, Johnson and Beaver Creeks, which have part of their drainage areas in Colorado and part in Wyoming. From measurements made, Mr. Field estimates that the Colorado drainage alone contributes 16,000 acre feet through Johnson Creek and 6,000 acre feet through Beaver Creek, or a total of 22,000 acre feet, making a grand total of 197,000 acre feet. This does not include any water flowing into Wyoming through Sand Creek. The Decker Ranch records were very questionable; in fact, there are two sets of records, one according to the gauge heights reported by the water commissioner and the other as published by the United States Geological Survey, those shown by the water commissioner being very much higher. The station was established in 1904 by Mr. Lamb, a hydrographer for the United States Geological Survey, who furnished the water commissioner, Mr. Decker, with a rating table and Decker kept records based upon this rating table. The published record was made by the United States Geological Survey, reported in Water Supply Papers 171 and 172, and a great variance appears between the Decker reports based upon the Lamb rating table and the published reports. For illustration, in the month of July, 1904, according to the Lamb rating table, the discharge was 14,193 acre feet, whereas, according to the published figures which are adopted in Exhibit 126, the discharge was only 12,746 acre feet; August, according to the Lamb rating table, was 5,922 acre feet as against 4,667, the published record; in September, 3,453, according to the Lamb rating table as against 2,547 in the published records; again, in October, 3,493 as against 2,577; the aggregate for the months of July to October being, according to the Lamb rating table, 27,061 as against 22,537 shown by the published record. Attention is drawn to the fact that Exhibit 126 shows the published or lower record.

Another error appears in this, that in the year 1904, comparing the published record at Decker Station for July with the Glendevey Station for the same month, the inflow between the two stations was only 2,606 acre feet, whereas McIntyre Creek and other creeks mentioned augment the river between

these two points and an increase of 2,606 acre feet between the two stations is manifestly low.

Because of these obvious errors, these Decker records shown on Exhibit 126 were discarded (3431-3437).

The discrepancy between the Lamb rating table and the published records is not definitely accounted for. However, inasmuch as the records were prepared probably in Washington and published some years after they were taken, there is ground for believing that the error occurred there, particularly in view of the fact that on one of the records a statement is noted to the effect that certain gaugings were probably too high because of a defective meter. A defective meter, however, would show a discharge lower than the actual discharge, rather than one higher than the actual discharge (3436), so that the explanation is not satisfactory, but regardless of what explanation may be made, the fact remains that the published records are considerably lower than those based upon the rating table made by the hydrographer Lamb.

The Boswell records, however, are retained, but they are subject to a criticism, which will be mentioned later, that is, that the station did not measure all of the water passing at high water by reason of a peculiar topographical condition at the station.

These two tables should also be criticised in justification of discarding the Decker records from another viewpoint. The mean for the Decker Station for the months given in the respective years seems to be 116,797 and that at Boswell's 132,247 acre feet. Based upon the Poudre River standard of normal, the years covered by the Decker records would give 101 per cent of normal, while those given by the Boswell records, based upon the Poudre standard, would be 81 per cent of normal, or based upon the Woods Landing standard, 85 per cent of normal. It is therefore obvious that the Decker records are manifestly low.

The next station below Boswell's on the river is Woods Landing, some nine miles below the state line. In the analysis of the water supply question, Mr. Field proceeds to the records taken at this station and refers to Exhibit 127, which shows the discharge of the Laramie River in acre feet for the months of April to October, inclusive, during the years 1895 to 1900 and 1911 to 1913. The table, in the second column, shows, also, the amount diverted through the Sky Line Canal and Sand Creek or Divide Ditch, giving a total, with this added amount, of 216,244 acre feet. (3439.) This figure does not include the flow for the winter months, that is, November to March, inclusive, during any one of these years. Then, from the percentage of flow for each fractional year, based upon this mean as shown, and also the percentage of normal based upon

the normal flow of the Poudre, it appears on the table that the years covered by this table, in combination, are 96.1 per cent of normal, and that normal would be 225,000 acre feet, the mean for the months of April to October.

Exhibit 128 is a table showing the discharges of the Laramie River at Woods Landing for the various months upon which measurements were taken for the years 1889 to 1900, inclusive, and 1911 to 1913, inclusive. This table is based upon various records. The figures for the 1912 record are taken from Mr. Meeker and are shown on his table, Exhibits B, I and T-7. Some figures are preceded by the letter A. They were furnished in the year 1911 by a deputy State Engineer of Wyoming, Mr. Harry True, from unpublished records in the office of the State Engineer of Wyoming, at the request of the officers of the Greeley-Poudre District, in order that they might ascertain as nearly as possible the total run-off of the Laramie River. If all the records in this table are used, the flow at Wood's Landing, exclusive of the diversions of the Sky Line and Divide Ditches, is indicated at an average of 254,111 acre feet (3441) and this figure does not include the run-off in Sand Creek from Colorado. In analyzing this table, the witness discards the records prior to and including the year 1894 as being subject to question, and uses only the subsequent years, and of these subsequent years only the records between April and October as a basis for his conclusions, because the winter records were not numerous, and, in one case, subject to criticism (3441) as being much above the average for their corresponding months. This disposes of the contention of the complainant that Mr. Field took only the higher records, discarding the lower, in reaching his conclusions.

Referring again to Exhibit 127, the average discharge, excluding the amount taken through the Sky Line and Divide Canals, is 198,545 acre feet for the months of April to October, inclusive. The flow of these months being about 90 per cent of the annual flow (3442), makes the average discharge for the whole year 220,490 acre feet. (3442.) All of these years in combination, as indicated in the table, are 96 per cent of normal, based upon the Poudre standard. The normal average discharge, therefore, for the year, would be 230,000 acre feet, which, coupled with the 20,000 acre feet passing through the Sky Line and Divide Ditches, would make a total of 250,000 acre feet passing Wood's Landing, and this is exclusive of the supply furnished by Sand Creek. The total inflow between Boswell's and Wood's Landing is estimated at 35,000 acre feet of which 22,000 acre feet, as heretofore stated, is furnished by Colorado, making an inflow from Wyoming between the stations of 13,000 acre feet. If this be deducted from the 250,-

000 acre feet, it leaves 237,000 acre feet as furnished by the State of Colorado, exclusive of Sand Creek.

By another method, we get a similar result—that is, taking 216,244 acre feet as the total run-off, April to October, at Wood's Landing, according to Exhibit 127, including the Sky Line and Divide Ditches, the years in combination being 96 per cent of normal, gives a normal for these months of 225,000 acre feet. Now, estimating this as being 90 per cent of the yearly total, in other words, estimating the winter flow, November to March, inclusive, as being 10 per cent of the total amount, which is less than one-half of the amount actually shown on Exhibit 128 as the winter flow, gives a total to Wood's Landing of 250,000 acre feet. Again deducting the 13,000 acre feet supplied by Wyoming through intermediate tributaries, gives 237,000 acre feet at the state line exclusive of the amount of water contributed from Colorado to Wyoming by Sand Creek. (3443.)

By still another method the same conclusion can be reached. The Boswell Station record (Ex. 126) gives a mean for the period covered, April to November, inclusive, based upon a three years' record, of 132,247 acre feet, to which should be added 20,000 acre feet for the Sky Line and Divide ditches. These months represent about 92 per cent of the annual flow which would therefore be, including the Sky Line and Divide ditches, 165,700 acre feet. The three years covered, 1911, 1912 and 1913, represent 72, 104 and 51 per cent, respectively, of the normal flow as established by the Wood's Landing records; or, in combination, 75 per cent. On this basis the total discharge would be 220,933 acre feet, to which must be added the Colorado water in Johnson and Beaver creeks of 22,000 acre feet, making a total across the state line of 242,933 acre feet, exclusive of the Sand Creek discharge (3444).

Still another method may be employed in confirmation of these different conclusions. Considering the year 1912 approximately normal, the discharge, as shown on Exhibit 127, at Wood's Landing, for a period April to October, inclusive, 1912, is 236,550 acre feet. This period, as before stated, covered about 90 per cent of the annual discharge which would therefore be 262,830 acre feet, and if, instead of the estimate of 90 per cent for the period April to October, 1912, covered, we use the winter flow as given by the record (Ex. 128), the total discharge at Wood's Landing for 1912 would be 256,396 acre feet, and if again a deduction is made, for the reason that 1912 appears (Ex. 127) to be 104 per cent of normal based upon the Wood's Landing records alone, then 100 per cent of the normal would be 246,500 acre feet, from which again must be deducted the 13,000 acre feet of Wyoming water discharged through Beaver and Johnson creeks, leaving 233,500 acre feet as the annual

discharge at Boswell's (state line), exclusive of the Sand Creek discharge (3444).

Another method is to take the Boswell's Station records for the year 1912, April to October, inclusive, of 182,248 acre feet, adding thereto the amount actually diverted by the Sky Line and Divide ditches in that year, 23,143 acre feet (Ex. 124), making a total of 205,391 acre feet. These months represent 90 per cent of the total annual discharge which would therefore be 228,821 acre feet, to which must be added the Colorado water discharged by Johnson and Beaver creeks, or 22,000 acre feet, giving a total discharge across the state line of the Colorado watershed, exclusive of Sand Creek, of 250,821 acre feet. Again considering 1912 as 104 per cent normal, based upon the Wood's Landing records, the normal yearly flow would be 242,000 acre feet (3445).

By still other methods of calculation, the average yearly flow of the Laramie River at Boswell's, together with the Colorado water furnished below by Johnson and Beaver creeks, but exclusive of Sand Creek, is 237,000 acre feet, 233,500 acre feet, and 242,000 acre feet, the average of which is 237,500 acre feet, slightly less than the average if the methods heretofore mentioned are taken as the basis (3445).

As previously stated, the 1912 record, Exhibit 128, is taken from Mr. Meeker's table of the discharge of the river at Pioneer Dam, as is shown on complainant's Exhibits B, I, and T-7. That this record is incorrect and shows entirely too low a flow, appears from this: the record for the year is limited to the months of April to December, inclusive, and for the months of June and July he actually shows a less discharge than appears at the Boswell station for those months, notwithstanding there is a considerable run-off during these two months from the territory lying between the two stations. Exhibit 129 apparently is prepared to show the difference in the discharge. As a matter of fact, however, the table is based primarily upon the records at Boswell's, to which are added the records of the inflow, the sum being the flow at Wood's Landing. A casual inspection of the exhibit, without reference to the testimony, would indicate that certain Wood's Landing records were taken, from which the Boswell records were subtracted, to show the inflow. The evidence, however, discloses that the opposite method was employed in arriving at the amount of the flow at Wood's Landing; that is, the Wood's Landing record, as shown on Exhibit 129, was arrived at by adding to the Boswell station the inflow between Wood's Landing and Boswell's. The evidence shows that in 1911 the difference of discharge between the two stations was 5,600 acre feet for May; 10,975 for June; 1,916 for July; 2,700 for August; 664 for September; and 465 for October; or a total for the period, May to October, inclusive,

of 22,311. In other words, that was the inflow between Boswell's and Wood's Landing, and 1911 was a year of less than normal flow, probably about 72 per cent of normal (3449).

The records for 1913 show a difference between the measurements at the two stations of 4,123 acre feet for May, 1,217 for June, 936 for July, 1,210 for August, 1,616 for September, 1,044 for October, 45 for November; and, estimating the inflow for April at 1,500, makes a total for the period covered in 1913 of 11,681 acre feet. The year 1913 was about 51 per cent of normal, so that it appears from an analysis of these tables that Mr. Meeker's 1912 record for the Pioneer Dam (Exhibits B, 1, and T-7) are probably more than 10,000 acre feet too low for the month of June, and more than 20,000 acre feet too low for the full year (3449).

In 1912 the records on Exhibit 129 were largely estimated. The inflow between the stations, based upon the discharge of Johnson and Beaver Creeks and other accretions, seems to be about 40,000 acre feet, but a conservative estimate was made of 32,059 acre feet (3451). As confirming the estimates made for the respective months of the year 1912, certain measurements made by the hydrographer for the office of the State Engineer of Colorado, can be used. These measurements were made in the year 1913 and were: 6 in May, 7 in June, 5 in July, 1 in August, 1 in September, and 1 in October. Using these as a basis, the difference between the two stations would be as follows: May, 5,547 acre feet; June, 2,211; July, 381; August, 380; September, 586; and, estimating 1,500 acre feet for April and 500 acre feet in October to complete the period covered by the 1913 table, Exhibit 129, we have a total of 11,105 acre feet, thereby confirming the other measurements shown on the table for the year 1913, which total 11,636 acre feet (3451).

Now, assuming the year 1912 to be approximately normal and the year 1913 to be slightly in excess of 50 per cent of normal, and taking the measurements for the fractional part of the year, we can arrive at the conclusion that the normal difference between the two stations for the year 1912 would be between 30,000 and 40,000 acre feet, that is to say, the Wood's Landing record for the year 1912, if correct, should show between 30,000 and 40,000 acre feet more than is shown at Boswell's, thereby confirming the statement that Mr. Meeker is low in his 1912 measurements at the Pioneer dam (3453).

The drainage area of Sand Creek in Colorado is given, for this purpose, as about 50,000 acres (3445), although other witnesses place it as high as 81,000 acres. The run-off from the area should be one-third of an acre foot per acre, and if the lowest estimate of the area be accepted, that is, 50,000 acres, the run-off in Colorado through Sand Creek is 17,000 acre feet per annum, which, if added to the 237,000 acre feet, the average

for the Laramie River itself, the total amount furnished by Colorado is 254,500 acre feet. (3444.)

Let us depart for a moment from the question of water supply and consider the relative amount of this Colorado water which can be diverted. As previously stated, the average of the diversions made by the Skyline and Divide ditches is 20,000 acre feet, or 8 per cent of the Colorado water. The Greeley-Poudre District, through the tunnel, according to Field's estimate, can take 56,000 acre feet, or 22 per cent additional, and if the Lower McIntyre development should ever be added, making a total through the tunnel of 71,000 acre feet, the Greeley-Poudre diversion would be 28 per cent of the total, or a combined total through the Skyline and Divide canals, the Greeley-Poudre system as planned and all possible diversions from the river by means of the Lower McIntyre extension, of 36 per cent of the supply which the State of Colorado itself furnishes to the Big Laramie River. (3445.)

If we should eliminate entirely the supply furnished by Sand Creek of 17,000 acre feet, and, on a basis of a total diversion of 91,000 acre feet by Colorado, there would still be included in these Colorado diversions only 38.4 per cent of the Colorado water. (3446.)

In other words, eliminating Sand Creek, 38.4 per cent would then represent the extreme limit of the Colorado diversions under any and all circumstances from the Laramie River. Without the extension of the Greeley-Poudre system to the Lower McIntyre, the total diversion would be 30 per cent, or, reversing the statement, the fact is, that including the Skyline diversion, the Divide or Sand Creek diversion, and the Greeley-Poudre tunnel diversion, 70 per cent of the water of the Laramie River watershed arising within the State of Colorado must pass into the State of Wyoming, notwithstanding anything which Colorado might do in the future, with the exception of the one extension to the Lower McIntyre. (3446.)

It therefore appears that by its bill of complaint in this cause, Wyoming is seeking not only the 70 per cent of Colorado water which it must and will receive, but in addition to that, the 22 per cent which it is proposed to divert to the Greeley-Poudre tunnel.

The Little Laramie.

In taking the measurements of the flow of the Little Laramie River, no attempt has been made to charge anything to the use of the water in the Centennial Valley, which, as before stated, is similar in many respects to the Colorado area of the Laramie Valley. All water consumed by the ditches in the Centennial Valley is therefore eliminated from consideration in the tables given of the Little Laramie flow. (3469.)

Exhibit 131, produced by Mr. Field, is a table giving the discharge measurements of the Little Laramie River at Hatton, Wyoming, near the point where the river emerges from the mountains onto the Laramie Plains. The measurements were made at a place called May's Ranch for the years 1902, 1903, 1911 and 1912, and the records are from U. S. Geographical Survey publications, while the 1913 record is the flow at the Lake Hattie Inlet plus the flow in the Bellamy Canal, the figures being furnished by Mr. Meeker. (3705.) The Bellamy Canal is one of the ditches diverting water from the Little Laramie to Lake James. In addition to this one there is also another large ditch which diverts water from the north fork of the Little Laramie. It is above the station and therefore its diversions are not included in the flow of the stream. This ditch is commonly called the Loback Ditch. This table indicates an average discharge for the years given of 93,373 acre feet, but there are partial returns only for four out of the five years given. The only complete record, 1913, was one of very low flow. The average discharge of the Little Laramie, as shown by this table, for the months of April to October inclusive is 86,828 acre feet. There is no record at Wood's Landing on the Big Laramie for the years 1902 and 1903, so, going to the Poudre for the percentage of normal, we find that 1902 was 51 per cent and 1903 116 per cent of normal. 1911, based upon the Wood's Landing record, was 72 per cent; 1912, 104 per cent, and 1913, 51 per cent. These, in combination, being 80 per cent of normal, the normal discharge for the period, April to October inclusive, would therefore appear to be 108,535 acre feet, and for the entire year, 120,600 acre feet. (3470.)

Comparing the discharge of this station with that of the Big Laramie at Boswell's or Wood's Landing, we have still a further check upon what is probably the normal discharge of the Little Laramie at this station. The normal discharge of the Big Laramie at Boswell's has been given as 220,933 acre feet. With the Little Laramie calculated at 120,600 acre feet, the percentage would be 55 per cent of the Big Laramie at Boswell's, or 61 per cent if we exclude the Sky Line and Divide ditches. (3470.)

The winter discharge at Boswell's appears to be 4,185 acre feet per month. 55 per cent of this amount would probably represent the winter flow of the Little Laramie at Hatton. This would be 2,400 acre feet per month, or 12,000 acre feet for all winter months, which, added to 108,535 acre feet, the normal for the period April to October inclusive, would give a total discharge for the year of 120,535 acre feet, arriving at the same conclusion by a different method. (3471.)

By still a further analysis of figures at Boswell's and Hatton, based upon the record for months that are common to both

stations, Mr. Field arrived at the conclusion that the flow at Hatton on the Little Laramie was 55 per cent of the flow of the Big Laramie at Boswell's, and by another analysis arrives at the conclusion that the discharge of the Little Laramie at Hatton, based upon the records in these calculations, was 120,700 acre feet per annum as an average for normal. (3472.)

It next becomes of interest to consider the total amount of water available annually for the Laramie Valley as a whole. We have heretofore shown by the witness Field that the annual normal discharge at Wood's Landing on the Big Laramie River is approximately 250,500 acre feet, and on the Little Laramie at Hatton, 120,700 acre feet. Turning again to the consideration of the Big Laramie, there is a tributary that enters the stream below Wood's Landing called Fox Creek, with an estimated annual run-off of 14,400 acre feet. (3473.)

The total available water above the Wheatland Reservoir must also include the run-off from the mountain territory through Four Mile, Seven Mile, Cooper and other small streams heading in the mountains north of the Little Laramie, and on the west side of the Laramie Plains. This mountain territory is about 60 square miles in extent or 38,400 acres. A conservative estimate would place the run-off at one-third of an acre foot per acre per annum, yielding from this territory 12,800 acre feet. (3474.)

The mountain area on the east side of the Plains should also be considered. This area from a point opposite Two Rivers down to the Wheatland Reservoir is about 60 miles in length and about 5 miles in width on an average. Assuming it to be 3 miles in width, it should furnish an annual supply of 12,800 acre feet based upon one-ninth of an acre foot run-off over the area. (3474.) There is also doubtless considerable water furnished from the Laramie Plains area proper, which is very extensive, being in the neighborhood of 600,000 acres, but inasmuch as this inflow will be erratic, due almost entirely to violent storms, no charge was made by Mr. Field on that account. The total average supply from the Laramie River and its tributaries above the Wheatland Reservoir is 411,200 acre feet, the sum of the amounts just given. (3474.)

Below the Wheatland Reservoir some water enters the river in the canon from tributary streams from the mountain area lying principally to the north of the river (Duck Creek, Dodge Creek and others). This, however, has not been charged against the total supply available for the use of the Wheatland system. There is the flow of Blue Grass and Sybille Creeks. Measurements have been made of the flow of these streams from which the witness concludes that these two streams furnished 20,000 acre feet or more annually, making a total

supply above the Wheatland tract of 431,200 acre feet, the normal average flow. (3476.)

However, this must not be considered all of the water of the Laramie River, inasmuch as it does not take into consideration the water available from the North Laramie River which enters the main stream from the north, heading in the vicinity of Laramie Peak, nor the Chugwater, which enters the main stream from the south, heading on the eastern slope of the Green Mountains. As heretofore stated, these streams converge near the station called Uva and generally below the Wheatland area. There is some irrigation on both these streams and from reports published by the State Engineer of Wyoming for the years 1911 and 1912, the discharge of Chugwater near its mouth was 18,300 acre feet per annum. (3476.) The total discharge, therefore, of the stream in the Colorado and Wyoming areas would seem to be in excess of 450,000 acre feet without considering the flow of the North Laramie. Of this amount Colorado furnishes something in excess of 250,000 acre feet and in turn can use only the amount of the present diversions through the Sky Line and Divide canals, 20,000 acre feet; through the tunnels and collection ditches as planned, 56,000 acre feet, and through the other possible diversion from the river by the extension of the system to the lower McIntyre, 15,000 acre feet, making a total possible diversion of 91,000 acre feet.

Confirming Mr. Field's estimates, two other tables were also introduced. Exhibit 143 is a table showing the discharge of the Big Laramie River immediately above its junction with the Little Laramie River, the point being called Two Rivers. Record covers portions of the years 1909, 1910, 1911, 1912 and all the year 1913, the mean discharge at that point being 126,753 acre feet.

Exhibit 144 is a similar table showing the discharge of the Little Laramie River immediately above its junction with the Big Laramie River, this point also being termed Two Rivers.

The court will understand that measurements were made immediately above the junction upon both branches of the stream after all upper diversions including the Pioneer Canal, Lake Hattie and Lake James had been made. In each case the station was termed Two Rivers.

The Little Laramie station records, Exhibit 144, cover the same years as Exhibit 143. There was a mean discharge of 50,132 acre feet per annum, the mean being based upon the measurements for the respective months shown on the table.

The combined means at Two Rivers station, that is, 126,753 acre feet on the Big Laramie, and 50,132 acre feet on the Little Laramie, 176,885 acre feet, represent the total flow of the Laramie River immediately at the junction, and inasmuch, as has

been heretofore shown, as there is relatively a small amount of irrigation below this point and the Wheatland Reservoir, it therefore follows that the major portion of this water is available for the Wheatland system. If Mr. Meeker be correct in his estimate of the capacity of the Wheatland Reservoir at 83,500 acre feet, there is therefore at this point available more than twice the capacity of the reservoir, and if the reservoir capacity be 126,000 acre feet, there is a surplus above that amount of 50,000 acre feet per annum.

Lake Hattie and Lake James, the other two large reservoirs, and by far the greater portion of the irrigation in the Laramie Plains, are above Two Rivers. Referring to plaintiff's Exhibit K, we learn that Lake James was storing water from April 21 to August 3 in 1912 and from April 19 to May 25 in 1913; and that Lake Hattie, which receives water from both the Big and Little Laramie Rivers, commenced storing from the Big Laramie April 8, and ceased October 5, 1912. Apparently recommenced and ceased again December 26 and commenced storing water from the Little Laramie June 4 and ceased August 10, 1912, and in 1913 commenced storing from Big Laramie April 25 and ceased on June 13, receiving no water from the Little Laramie in 1913.

An inspection of Exhibits 143 and 144 shows that after this storage had been made by these two reservoirs, although it continued in 1912 practically through the irrigation season and in 1913 well into the irrigation season, nevertheless there was abundant water in the streams at the junction for every need below; although the court will recall that while the year 1912 was approximately normal or slightly above normal, the year 1913 was only about 55 per cent of normal.

Further supplementing his conclusions, the witness reviews the evidence given by Wyoming relative to the amount of water stored in the various reservoirs in that state diverting water from the Laramie River or its tributaries.

Referring first to Lake James, according to the testimony of Z. E. Sevison, a witness on behalf of the State of Wyoming, the capacity of this reservoir is 41,100 acre feet (631). This reservoir was constructed in 1908 or 1909, although not really completed until 1911 (633). Water was first stored for irrigation in the year 1909. In that year the storage was 18,000 acre feet, a small amount of which was used and the balance carried over. Including this amount carried over, the storage in 1910 was 10,000 acre feet, and at the end of that season the lake was practically empty. In 1911, 10,000 acre feet was stored and all used; in 1912, the storage was 22,000 acre feet, of which about 18,000 acre feet was carried over the irrigation season, in other words, not used; and up to March, 1913, 3,000 acre feet additional had been stored. According to Exhibit J, a table

produced by R. I. Meeker, a witness for the State of Wyoming, there was diverted into the Bellamy Canal and Lake James from the Little Laramie River, 24,793 acre feet in 1912, and in 1913 to November 30, 12,310 acre feet. According to Exhibit K, Mr. Meeker found that on July 17, 1912, there was 15,000 acre feet in storage in Lake James, and on November 25, 1912, 18,400 acre feet, and that storage commenced that year April 21st and ended August 3rd; on April 25, 1913, 20,400 acre feet; October 30, 1913, 19,800 acre feet, and that storage commenced that year April 19th and ceased May 25th. Sevison testified that there was no water carried over from 1911 to 1912; so by deducting the amount in storage November 25, 1912, 18,400 acre feet, from the diversions made in 1912, 24,793, we have 6,393 acre feet used or possibly lost. It appears, therefore, that in the practically normal year of 1912 there was not only an excessive amount of water available, but there was actually stored above all uses, 18,400 acre feet (3483).

Referring now to Wheatland Reservoir: according to the complainant's witness, J. A. Elliott, no water was carried over in Wheatland Reservoir from 1910 to 1911, nor from 1911 to 1912 (170). According to the Wyoming hydrographer, Mr. Meeker, the flow at Look Out, which is immediately above the Wheatland Reservoir, from May 27th to December 31st, 1912, was 119,770 acre feet, and there was in the reservoir on May 27th, 1912, 36,600 acre feet (Exhibit K). There was, of course, considerable flow into the reservoir prior to May 27th, as the high water in the river begins prior to that date. Assuming this amount to be 6,000 acre feet, which is conservative, there was into or through the reservoir in 1912, 162,370 acre feet (3483). There was withdrawn from the reservoir in 1912, as shown by the records at McGill station on the river below the reservoir, 95,653 acre feet, and it is known that there was water discharged from the reservoir at a date in 1912 earlier than that shown by the McGill station records. Assuming that to be 6,000 acre feet, the total amount drawn through the reservoir was 101,653 acre feet (3483), which subtracted from the amount into or through the reservoir, 162,370, leaves a balance of 60,717 acre feet (3484), while Meeker, according to Exhibit K, states that on November 18, 1912, there was 43,000 acre feet left in the reservoir, and from November 18th to the end of the year 1912, the inflow was 5,540 acre feet; or, according to Meeker's estimate, 48,540 acre feet at the end of the year 1912. These figures are substantially confirmed by the testimony of J. A. Elliott, the engineer having Wheatland Reservoir in charge, that there was 40,000 acre feet in the reservoir at the end of the irrigation season of 1912 (170). The inflow for October, November and December was 19,070 acre feet and the outflow only 463 acre feet, leaving the amount which should be in the reservoir at

the close of the season 58,607 acre feet (3484). Allowing for evaporation, this discrepancy between Elliott and Meeker can be accounted for by the difference in their estimates of the capacity of the reservoir, Elliott basing his figures upon a capacity of 120,000 acre feet (170), while Meeker takes a capacity of 83,500 acre feet.

Referring now to Wheatland Reservoir No. 1, which is a smaller reservoir located near the center of the Wheatland tract, capable of storing water not only from the Laramie River through the Wheatland tunnel, but also water from Sybille and Blue Grass creeks; this Reservoir has an active capacity, according to the witness Elliott, of 7,000 acre feet (166), and is used for the irrigation of lands in the Wheatland tract. Complainant's Exhibit K contains the statement that there was on storage September 10, 1912, 10,500 acre feet, estimated, and on November 1, 1913, 2,100 acre feet, showing a use above any water that may have been stored in the reservoir during the year 1913 of 8,400 acre feet.

Lake Hattie, according to the Wyoming testimony, has an active capacity of 68,500 acre feet, with a dead or unavailable capacity of 42,000 acre feet additional, and the complainant's testimony showed that water was available; in other words, the dead space had been filled and water could be withdrawn in June, 1912. Complainant's Exhibit J by Meeker, shows that there was furnished from the Little Laramie alone in 1912, 14,053 acre feet, and from the Big Laramie (Exhibit I), 69,855 acre feet; or, a total of 83,908 acre feet. Exhibit K by Meeker shows that on November 20, 1912, there was 18,700 acre feet available storage in the reservoir and that no water was run from the reservoir in 1912. It would therefore seem that the difference between the total inflow, 83,908 acre feet, and the amount on hand November 20, 1912, 18,700 acre feet; or, 65,208 acre feet, is probably the dead or inactive capacity instead of the 42,000 acre feet testified to, subject, however, to this modification, that there is, of course, considerable loss by evaporation and seepage. Allowing 3,208 acre feet for this loss, the dead capacity would then appear to be 62,000 acre feet and the total amount stored in 1912, both available and unavailable, would be, with this correction, 80,700 acre feet. On April 24, 1912, according to Exhibit K, there was 19,400 acre feet stored and available and the inflow from the Big Laramie in 1913, from April 25th to some date not mentioned, in June, was, as shown by Exhibits K and I, 28,470 acre feet. On November 5, 1913, there was 26,000 acre feet in the reservoir (Exhibit K). There was, therefore, used or lost through evaporation, seepage, etc., 21,870 acre feet. Allowing for possible loss by seepage and evaporation, 5,000 acre feet; the use of the reservoir was 16,870 acre feet for the year 1913, which is admittedly a very low year

in the amount of water supply. Nevertheless, during this low year, Lake Hattie succeeded in increasing its storage above its use and loss by evaporation, from 18,700 acre feet on November 20, 1912, to 26,000 acre feet November 5, 1913; or, 7,300 acre feet, without taking any water whatever from the Little Laramie River in that year (3487).

It therefore appears that there was stored in these reservoirs, in the year 1912, above the amount actually used for irrigation from the reservoirs, the following:

In Lake James.....	18,400 acre feet
Wheatland No. 2.....	47,000 acre feet
Wheatland No. 1.....	10,500 acre feet
Lake Hattie	80,700 acre feet
Or a total of.....	156,600 acre feet

This amount, 156,600 acre feet, is manifestly the amount stored in excess of the use and evaporation from the reservoirs in that year (3488).

Furthermore, the records at Wheeler's Bridge, which is on the Laramie River below the canon, for the year 1912, indicate that there was about 10,000 acre feet of water passed that point, which is above the mouth of Sybille Creek. 1912 was a year of larger flow than 1913, and yet the records for the year 1913 show that there was 19,000 acre feet discharged by Sybille Creek. 1912 would undoubtedly be greater and probably as much as 20,000 acre feet. Chugwater, for the year 1912, according to the records, discharged 18,300 acre feet. Adding these amounts to that left in the reservoirs, 156,600 acre feet, gives a total of 204,900 acre feet, the aggregate amount carried over in storage (above the use) and the amount wasted (3489). Estimates of seepage loss, of course, may vary. If it be contended that Field's estimates in this regard are low, then his estimate of this amount of surplus water, 204,900 acre feet, would be reduced accordingly.

The witness Field increases this amount by the addition of estimates of loss by evaporation and waste not heretofore detailed, a consideration of which is not necessary for this argument. However, this amount, 204,900 acre feet, must not be understood as being the total supply of water for irrigation for that year. It does not include the amount used, either by direct irrigation from the river through the ditches, or the use from the reservoirs themselves. It is merely the amount carried over in storage that year plus the amount passing down the river at Wheeler Bridge and the amounts discharged into the Laramie River from Sybille and Chugwater Creeks.

According to the witness Elliott for Wyoming, the amount of water furnished to the Wheatland tract in the year 1912

was 100,000 acre feet (170). The amount diverted through the Pioneer Canal in that year, according to Meeker, was 17,703 acre feet (Exhibits B, I and T-7), all other ditches between Pioneer Dam and Two Rivers (Big Laramie), 29,892 (Exhibit T-7), ditches between No. 2 Dam and Two Rivers (Little Laramie), 17,245 (Exhibit T-8). These amounts added to the sum of 204,900 acre feet, give 369,740 acre feet, and still do not account for a large amount of irrigation through numerous other ditches.

Referring again to the 1912 records, showing an inflow into Lake Hattie Reservoir from the Big Laramie River of 69,855 acre feet, as shown by Mr. Meeker on Exhibits B, I and T-7, and which were adopted by Mr. Field in his analysis of the Wyoming evidence, it is of interest at this time that, in rebuttal, Mr. Meeker criticised Mr. Field's analysis, particularly his graphs showing the flow and use of water on the Big and Little Laramie Rivers for the year 1912, Exhibit 136, and 1913, Exhibit 141, contending that he had duplicated the amount of water diverted by the Pioneer Canal, the amount being 17,703 acre feet in 1912 and approximately 12,000 acre feet in 1913, and that the error had been carried through both charts. Upon being challenged on cross-examination, he corrected this statement (4322) and revised his Exhibits B, I and T-7 from which Mr. Field had taken the data relative to the distribution to the various reservoirs, and admitted that he himself had made a duplication of the 17,703 acre feet and deducted that amount from the sum which he charged to Lake Hattie Reservoir from the Big Laramie River in 1913 and added it to the amount charged to the Wheatland Reservoir No. 2 and the ditches below Two Rivers. Therefore, in so far as Mr. Field is concerned, the corrections made by Mr. Meeker in his distribution simply reduce the amount of storage for 1912 in Lake Hattie and increase the amount in Wheatland Reservoir No. 2 proportionately. The witness further corrected his testimony and admitted that the error of 12,000 acre feet which he charged in Exhibit 141 did not, in fact, exist (4323-4).

In regard to the dead space in Lake Hattie which has to be filled before any stored water is available, and which, according to the testimony of Wyoming's witness Bishop, is 42,000 acre feet, and which the witness Field states may be as great as 62,000 acre feet, it is pertinent to say that the demand for water to fill this dead space is not constant, that is, once having been filled, it will, except for the loss occasioned by seepage and evaporation, remain in the reservoir and the initial filling of the reservoir made a greater demand on the river than subsequent fillings will do. If this reservoir had been filled prior to 1912, then, with the amount of water diverted into this reservoir in that year, the reservoir would have been entirely

filled and approximately 12,800 acre feet would have been the surplus (3494).

Moreover, without any comment upon the economy of maintaining a condition which could, by the expenditure of some labor, be remedied at least in part, that is, maintaining a reservoir with this enormous amount of dead space from which there is bound to be considerable loss in any year, nevertheless the amount of water required to fill this dead space, if applied to the lands of the defendant, The Greeley-Poudre Irrigation District, would have been sufficient to have irrigated a number of acres equal to about 75 per cent of the total number of acre feet of such water for one year (3495). However, for the purpose of future consideration of the demands upon the river, this dead space can be eliminated from consideration.

To more graphically illustrate the flow of water in the river, the witness Field produced several diagrams or hydrographs showing the flow of water in the Laramie River in the year 1912.

The first of these, Exhibit 132, represents the amount of water flowing past certain points on the Laramie River from the Sky Line Canal to Woods Landing for the different months in the year 1912, differentiating between the amounts diverted to the Sky Line and Divide Ditches, the amount which could be diverted by the tunnel and collection ditches of the Greeley-Poudre System, the inflow from Glendevey to Boswell's station and from Boswell's station to Woods Landing. The hydrograph is explained by the witness in his testimony on pages 3497 to 3499.

Exhibit 133 is a similar representation based upon the flow of the Little Laramie River for the year 1912, and is discussed at pages 3499 to 3501.

Exhibit 134 is a similar diagram representing the flow and use from Two Rivers, Wyoming, the junction of the Big and Little Laramie Rivers, to Look Out, the station immediately above the Wheatland Reservoir (3501).

Exhibit 135 shows graphically the condition of Wheatland Reservoir No. 2 for the year 1912, in so far as there are available records. The diagram is constructed almost entirely upon data furnished by witnesses for the complainant. The upper curved line represents the combined flow of the Big and Little Laramie Rivers at Two Rivers station. The second line from the top represents the flow at Look Out station, the head of the Wheatland Reservoir. Both of these lines represent the total amount discharged up to any given date, but do not represent the flow at any one period. The third curved line from the top, marked "Out-flow less intake," is obtained by subtracting the out-flow as recorded at McGill station below the reservoir from the inflow. The blank area between these two lines

represents the outflow and is indicated by the scale on the graph. The bottom line designates the quantity reported in the reservoir by R. I. Meeker for the complainant, and the cross hatched area between the first and second lines represents the loss or use between Two Rivers and Look Out, or possibly errors in measurements. This exhibit is based upon the assumed capacity of 83,500 acre feet, that being the amount testified to by Meeker. If the capacity were greater than that amount, then the lines on the graph would be, as a whole, moved upward. This exhibit is discussed at pages 3502 to 3504 of the testimony.

Exhibit 136 is a mass diagram showing in a different manner the flow of the river for the year 1912 at different points and also the use of water during the year. The upper line of the diagram represents the supply of water expressed in acre feet, commencing with the source of the river and continuing to the mouth of Chugwater Creek, including also the discharge of the Little Laramie, aggregating a total of approximately 480,000 acre feet. The lower line shows the flow at the various points indicated after deducting the use or diversions from the river, and indicates that 50,000 acre feet passed down the Big Laramie River below the mouth of Chugwater Creek in the year 1912. (3505-3510).

Exhibit 137 is a mass diagram showing the amount of water from the Sky Line Canal to Wood's Landing on the Big Laramie River in 1913, similar to Exhibit 132 for the year 1912. (3538).

Exhibit 138 is a mass diagram of the Little Laramie River from Filmore to Two Rivers, showing the flow and distribution for the year 1913, similar to Exhibit 133, which was for the year 1912. (3539-3540).

Exhibit 139 is a mass diagram showing the flow and distribution of water in the Laramie River between Two Rivers and Look Out in the year 1913, similar to Exhibit 134 for the year 1912 (3541).

Exhibit 140 is a mass diagram of the inflow and outflow of Wheatland Reservoir for the year 1913, based upon two assumed capacities, the red lines indicating the inflow and outflow based upon a capacity of 123,000 acre feet, the blue lines indicating the inflow and outflow based upon a capacity of 83,000 acre feet. This diagram is similar to Exhibit 135 for the year 1912 except that Exhibit 135 was based only upon the assumed capacity of 83,500 acre feet (3542).

Exhibit 141 is a diagram for the year 1913, similar to Exhibit 136 for the year 1912, showing the accumulations of the discharge of the Laramie River and its tributaries, together with a representation of the flow after the diversions have been made and showing 30,000 acre feet passing out of the river below the mouth of Sybille Creek. This diagram does not in-

clude any discharge from Chugwater and in that respect differs from Exhibit 136. The mouth of Chugwater is below the lowest point indicated on the exhibit. (3542-3.)

Exhibit 142 shows graphically the supply and use of the water of the Laramie River in so far as it applies to the total supply of the river and the diversions by the Sky Line and Divide Ditches, and those which will be made by the Greeley-Poudre system. In other words, it graphically shows, in five columns, the total water supply by Colorado to the Laramie River and the relative amounts which will be diverted by Colorado.

Exhibits 132 to 142 are all drawn on a scale representing acre feet, the figures being noted on the scale at the left hand margin. The height to which any column or line ascends therefore indicates the number of acre feet represented. In all of them, the scale from left to right, or the horizontal scale is prepared for the various months of the year, but only in part is this scale appropriate. This will be clearly noticed when the exhibit in question is examined. In Exhibit 142 Mr. Field shows in column five the total flow of 254,000 acre feet per annum from Colorado. Column 1 shows the relative amount diverted by the Sky Line and Divide Ditches; Column No. 2, the tunnel diversion as planned, No. 3, the tunnel diversion plus the amount which might be diverted if the Lower McIntyre extension were made, and No. 4, the total of all of the Colorado diversions including the possible Lower McIntyre extension. The exhibit merely represents in graphic form the conclusions which Mr. Field arrived at as to the relative amount of Colorado water which can be diverted and which has been heretofore referred to (3544, 3545).

The witness then reviews the testimony of the Wyoming hydrographer, Mr. Meeker, considering more specifically his exhibits, which are based upon measurements through a portion of the years 1912 and 1913, as heretofore stated, although these were afterwards supplemented on rebuttal by a continuation of records to the date upon which the rebuttal testimony was given.

On complainant's Exhibit B, I and T-7, each of which is a table produced by Mr. Meeker, showing the flow of the river at the Pioneer Dam where Meeker found, or rather, estimated a flow of 207,000 acre feet for the year 1912, there is an apparent error in this, that the records at Boswell Station for 1912, exclusive of the Sky Line and Divide Diversions, shows 205,678 acre feet. There should be added the inflow from Johnson and Beaver Creeks, about 27,500 acre feet from both the Colorado and Wyoming areas, and other miscellaneous drainage sufficient to bring the total up to 239,697 acre feet at Pioneer Dam, a discrepancy of over 32,000 acre feet. The error appears to lie

particularly in the discharge for the month of June. At Boswell's Station the gaugings by the State of Colorado show a discharge for the month of 92,912 acre feet and the inflow between Boswell's and Wood's Landing from tributary streams was 9,914 acre feet, making a total of 102,826 acre feet, while Meeker in the three exhibits last mentioned, reports 91,874 acre feet, and in data furnished at the request of defendants but not introduced in evidence, showed 86,003 acre feet for the month of June. The result is that Meeker's tables are so faulty in material points as to discredit their correctness (3547).

The United States Geological Survey, according to measurements taken in the year 1912, found 94,700 acre feet in the Big Laramie alone at Two Rivers station from April 5 to October 31, inclusive, in 1912. (Ex. 143.) This would indicate an annual discharge of 120,000 acre feet against Meeker's estimate of 89,550 (Exhibit B), or a difference of 30,450 acre feet.

On Exhibit I for the year 1913, Mr. Meeker estimates 45,709 acre feet in the Big Laramie at Two Rivers, indicated on the table as "Wheatland Reservoir No. 2 and intermediate ditches below Two Rivers," while the Geological Survey records for the same year show a discharge of 54,001 acre feet (Ex. 143), a discrepancy of 8,292 acre feet (3548).

The mean shown on Meeker's tables B and I, based upon measurements for a part of the year 1912 and part of the year 1913, is misleading unless it be definitely understood that it is merely the mean of the figures given and not the mean discharge of the river. The year 1912 was approximately normal, while 1913 was only about half of normal, so that obviously the mean of these two years would not be the mean discharge of the river (3549).

Complainant's Exhibit J is also in error. It shows a discharge, June 1st to December 31st, 1912, of 93,667 acre feet at the Lake Hattie No. 2 Dam on the Little Laramie. On tables furnished defendants by Mr. Meeker, the discharge for November and December aggregated 3,760 acre feet. Deducting this amount gives a total for the period June to October of 89,907 acre feet, whereas the United States Geological Survey records for the same period show 94,200 acre feet. On the same table Meeker credits 37,556 acre feet to the Wheatland Reservoir and intermediate ditches below Two Rivers. In other words, this is the amount which he credits to the Little Laramie River at Two Rivers, exclusive of any inflow between Two Rivers and Wheatland Reservoir, he contending that there is none, whereas the United States Geological Survey for the same period shows 42,540 acre feet at Two Rivers, a discrepancy of approximately 5,000 acre feet (3551).

Complainant's Exhibit L, which is a table produced by the hydrographer Meeker, purporting to give a summary of the storage in the years 1912 and 1913 in the reservoirs, Wheatland Nos. 1 and 2, Lake James and Lake Hattie, is criticised particularly for the reason that the amount shown by this exhibit to be in Lake Hattie on November 20, 1912, 18,700 acre feet, does not show the amount of dead water which the reservoir held and which was, of course, a demand upon the river in that year and would be available, as stated, in any other year except the year of initial filling. In other respects assuming the correctness of the table, this dead water would have to be added to the total given in the summary for the year 1912 on Exhibit L (3552). If this dead water amounts to 42,000 acre feet, according to Bishop, then the total shown on the summary of 91,100 should be increased to 133,100 acre feet, or, if as estimated by Mr. Field, this dead water amounts to 62,000 acre feet, then the total amount for the year should be increased to 153,100 acre feet. It should also be noted that this table shows the storage as of date November 20th for both the years 1912 and 1913, not the total storage at the close of either year, which would doubtless be greater than the amount on November 20th.

Complainant's Exhibit M, also produced by Meeker, is criticised. This table purports to give the relation of run-off on the Laramie River between Glendevey and Wood's Landing stations and is subject to the same criticisms as have been directed to Meeker's 1912 records at the Pioneer Dam which have been previously discussed. The mean which the table assumes to produce is based upon entirely too short records, even assuming their correctness, for the year 1913 was admittedly much below normal. 1911 was also a low year, but not as low as 1913 (3553). If the comparison between the two stations was based upon the normal flow, the relation is 77,000 acre feet for the Glendevey station and 215,500 acre feet for the Wood's Landing station, after deducting the amount diverted by the Sky Line and Divide ditches at both stations. In other words, the Glendevey flow is 35 per cent of the Wood's Landing flow (3553). The note on the bottom of the exhibit which reads "Run-off at Woods, Wyoming, for July, August and September represents substantially the entire run-off of the Laramie River, except surplus from the Little Laramie River passing in occasional years and in considerable amounts produced by summer freshets" is not true. It does not include the amount diverted by the Sky Line and Divide ditches on the Big Laramie and there is heavy discharge from the Little Laramie River in all years. (See complainant's Exhibit J and T-8, prepared by Meeker and also defendant's Exhibit 131 and 144.)

Complainant's Exhibit K is criticised in this, that the statement that on May 27, 1912, there was 36,600 acre feet

in the Wheatland No. 2 reservoir is based on the assumption that the active capacity of the reservoir is 83,500 acre feet instead of 126,000 acre feet (3556) and for the further reason that there is no record as to the amount withdrawn from the reservoir prior to May 27th, but there is information that this discharge was as high as 600 cubic feet per second.

Professor L. G. Carpenter, the second witness for the defendants on the question of the amount of water available in the Laramie River, explains at length the methods adopted by hydrographers in measuring streams, with a criticism of the various methods, showing the relative accuracy of various ones (3761-3776), and then explains how rating curves and discharge curves are erected (3776-3777). He explains his study of the question of precipitation at various points affecting the run-off of the Laramie River and on streams to be compared with it in this regard, this investigation covering a period of years (3778-3784).

Professor Carpenter, while Director of the Colorado Experiment Station at Fort Collins, encouraged measurements on the Laramie River in Colorado. These were undertaken in 1902 and subsequent years by the United States Geological Survey, the hydrographer being a Mr. Lamb, a former student in the Colorado Agricultural College under Professor Carpenter (3789-3790). After the Geological Survey ceased taking measurements, Professor Carpenter furnished an automatic gauge to Mr. Decker who has been previously referred to, who took records for some time (3791) at the station known as Decker's.

In the year 1912, Professor Carpenter, with from one to three assistants, spent considerable time on the Laramie River and its tributaries, making measurements, particularly until the high water had passed. In that year there was an automatic gauge at the Boswell station which Professor Carpenter, upon examination, found to be defective in that the pen on the record had a constant tendency to show a lower discharge than actually existed in the river. Corrections were made from time to time by the witness or his assistants whenever one of them happened to be present when the record-keeper was changing the chart. Neither the witness nor his assistants had the instrument in charge and so could not correct it at all times, but only when they were able to co-operate with the keeper, who lived some distance from the station (3792-3795). On all occasions when a check was made it was found that the instrument was recording less than the actual flow of the river (3795). This chart gave the record upon which the State Engineer of Colorado based his published report.

In addition to this error, Professor Carpenter discovered what had apparently been overlooked by all hydrographers

previous to that time. By reason of a topographical formation, the river in the valley at Boswell's station flows generally northward, makes a bend, curving for a short distance to the east, and then turns again to the northward. The station where the records were obtained was located a short distance below this second bend, and it was discovered that when the water became high it overflowed and passed down through three separate channels to the west of the station, entering the river again at some point below, the result being that all of the water which passed through these extra channels escaped measurement inasmuch as only the main channel itself was in contemplation of the hydrographers making measurements, and the records, regardless of the inaccuracy of the measurements, failed to disclose the high water discharge of the river (3798). The witness immediately made measurements of the cross sectional area of these extra channels and also the height upon the gauge rod at the station in the main channel at which the overflow would occur (3798-3799). The channels in question are rather large and capable of carrying a material quantity of water. For illustration, on June 4, there was, in addition to 2,012 cubic feet per second passing in the main channel, 500 cubic feet of water per second of time passing through these three overflow channels, the total of which would have been, if correctly measured, the reported discharge of the river. On June 11 there was 220 cubic feet per second passing through the overflow channels and 1,790 cubic feet per second in the main channel (3801). This overflow continued for something more than four weeks during the period of highest flow in the river. Measurements taken by the witness and his assistants showing the discharge at various gauge heights are given (3803).

A diagram showing graphically the water which passed through these extra culverts and which was not included in the published records of the State Engineer, was introduced, Exhibit 158. In this diagram the discharge at Boswell's station, as shown by the published report of the State Engineer of Colorado is shown in yellow and the additional and greater discharge based upon Professor Carpenter's measurements, passing through the culverts and not recorded, is indicated by the red color on the diagram. The diagram covers a period commencing about the 17th of April and ending the 30th of September, and shows that about June 4, 5 and 6 the discharge was approximately 2,512 cubic feet per second. A glance at this exhibit makes clear the relative amount of water which was not included in the measurements made by the State Engineer's office and shown by his published figures. The witness Field, in arriving at his conclusions as to the flow of the stream, used the figures given by Professor Carpenter from his

actual measurements in making his determination of the flow at the Boswell station.

Professor Carpenter made no measurements personally in 1911. The presumption is that the error in the recording instrument at the Boswell station which he found in 1912 existed in 1911, and that the published record based upon the chart of the defective instrument shows a discharge less than the true discharge. The other condition, that is, that the high water in the river passed through the culverts mentioned, would be true of any year when the river reached a height sufficient to cause the overflow. An examination of the published records of the State Engineer for the year 1912 discloses that the defects in the recording instrument were taken into consideration whenever a correction was made on the chart, otherwise no correction was made, neither does the published record include the water passing through the extra culverts (3808).

The measurements made in 1912, in addition to those on the Laramie River itself at Glendevey and Boswell's, included regular observations on Grace Creek, Bear Creek, Johnson Creek, Jimmy Creek, Forrester Creek, Fox Creek, Beaver Creek, Stubb Creek, Nunn Creek, Deadman Creek, Rawah Creek, McIntyre Creek, La Garde Creek, Stuck Creek, at the Lake Hattie inlets, that is, both on the Big and Little Laramies, and on the Little Laramie and also occasional measurements on other tributary streams as opportunity permitted (3811). The data relative to these measurements was furnished to the State Engineer, John E. Field, a witness in this case (3812).

The witness reviews the hydrography of the several tributaries of the Laramie River (3813-3816), showing the relative size of each and its discharge, and also the watersheds which they drain, supplementing his investigations through the snow measurements before referred to, correlating the discharge measurements which he had taken with the depth of the snow as determined by his investigation, and describes with considerable detail the snow measurements and the relative amount of water which the watersheds would produce (3816-3823). He found that the range to the west of the Laramie River, known as the Medicine Bow Range, was a very excellent source of water supply and better than he had anticipated. We believe we are justified in stating that Professor Carpenter's wide experience in hydrographic matters, coupled with his very exhaustive investigation of the Laramie River and its watersheds, enables him to testify with far greater accuracy than if his knowledge of the situation was limited to measurements taken at a limited number of points on the stream for a portion of the year 1911, all of the year 1912 and a portion of the year 1913, as did Mr. Mecker, the Wyoming hydrographer.

Exhibit 156 is a number of photographs showing these snow measurements, the views being taken at various points from the head of the Laramie River in Colorado northward to the Centennial Mountains at the head of the Little Laramie River in Wyoming. The number on each individual picture has no connection with the case, being merely the serial number in the filing system used by Professor Carpenter, but each picture contains a legend showing the date upon which it was taken and the location. These views are described at pages 3883-3892.

The range is much broader in Wyoming than in Colorado, and, while there are some slightly higher elevations in Colorado than in Wyoming, this higher area is not extensive and the precipitation to the northward in the Wyoming area is greater than the precipitation at corresponding elevations in Colorado and a large part of the range in Colorado, that is, the part of lower elevation lying about fifteen miles south of the state line, is not so good a source of supply as is the Wyoming area (3891-3892).

During the year 1912 Professor Carpenter, in addition to his snow measurements, made many measurements on the Little Laramie River at Filmore and kept daily records. At that point the drainage area of the Little Laramie River is about 163 square miles, or 104,000 acres. The run-off for the month of June alone was 76,632 acre feet, and in July 27,676 acre feet by actual measurement, or practically a run-off for the two months of one foot in depth for the drainage area. That is, the run-off for June and July alone amounted to approximately 104,000 acre feet (3894). Contrast this with Meeker's estimate of 93,667 acre feet for the entire year of 1912 (Exhibit T-8).

Exhibit 157 is a hydrograph showing the flow of the Little Laramie River at this station, based upon measurements from May 20th to some date in October in the year 1912. It shows the flow in cubic feet per second for each day during the period covered, the highest discharge being in the month of June when the river reached a height of approximately 1,960 cubic feet per second.

The Greeley Poudre system, by means of its tunnel and collection ditches under construction, exclusive of the possible extension to the Lower McIntyre, in other words, the Greeley-Poudre system as contemplated, will divert 23½ per cent of the run-off of the Big Laramie River and its tributaries from Colorado, that is, 23½ per cent of the Colorado water. This is based not alone upon the measurements made in the year 1912, but upon investigations conducted by Prof. Carpenter through a number of years, particularly during the years 1909 and 1910, and upon which he made a report concerning the water supply available for the Greeley-Poudre Irrigation District (3933-3957). The project, as reported on by Prof. Carpenter after

his examinations in the years 1909 and 1910, did not include a consideration of the possible extension of the system to the Lower McIntyre, but did include the system as planned and under construction. Prof Carpenter's estimate at that time, as shown by this report, was that there was 70,100 acre feet of water available for the system from the Laramie River (3936), and his conclusion as to the total flow is that at Wood's Landing, with a watershed of 404 square miles, the actual run-off for a period of eleven years averages about 14 inches after deducting the diversions by the Sky Line ditch. This means, in other words, that the Wood's Landing net flow is approximately 301,000 acre feet per annum, and therefore the diversion of 70,100 acre feet at the tunnel by the Greeley-Poudre system means 22 per cent of the total Colorado flow or approximately 23½ per cent of the net flow after deducting the Sky Line Diversions (3956-3957). It will be noticed that Professor Carpenter's figures of the amount which may be diverted by the tunnel differ from those of Mr. Field. Carpenter finds that this diversion will amount to 70,100 acre feet; Field finds 56,000 acre feet. This difference is consistent with their difference as to the total flow, Field finding that the total Colorado water is in excess of 250,000 acre feet per year and Carpenter finding it in excess of 300,000 acre feet. It is significant, however, that they agree as to the percentage of the total supply of water which can be diverted through the tunnel. Field's conclusions as to the total flow are, according to Professor Carpenter, very conservative. Lest it be suggested that the witness Field may have struck an average between Professor Carpenter and the one Wyoming witness upon this point, Mr. Meeker, we direct the attention of the court to the fact that Meeker's conclusions in this regard were never testified to until the complainant introduced evidence in rebuttal.

The complainant placed Mr. Meeker on the stand in rebuttal on May 21, 1914, to which time he had continued his measurements on the Laramie River, and some of his previous tables were enlarged accordingly. He criticises the conclusions reached by the Colorado witnesses Field and Carpenter, as a rule not specifically, but, as we understand him, for the general reason that their tables were not all based upon personal measurements and because of the possibility of error in the work of other hydrographers (4272-4278), and states that he found errors in some of the earlier records of the Laramie River at Wood's Landing, due to the presence of ice in the stream when winter measurements were taken. On cross-examination, however, he admits that Field discarded these winter records (4331). As a conclusion of his criticism, he states (4279) that he would not feel justified in modifying his own records "because they have been secured under known conditions with

hydrographic methods of much greater efficiency and accuracy than those secured in the earlier days."

He criticises Professor Carpenter's measurements taken at Boswell station, contending that the professor had taken too great a cross sectional area and too high mean velocities, while he prepared from his own measurements an area curve which he calls a standard area curve and a discharge curve which he terms a standard discharge curve. From these he prepared a discharge table which he terms a standard discharge table, Exhibits T-1, T-2 and T-3. In Exhibit T-4 he gives a comparative table of the run-off at the Colorado line for the months of April to November, inclusive, in the year 1912, based upon the published records in the 16th Biennial Report of the State Engineer of the State of Colorado, showing a discharge of 160,873 acre feet (erroneously printed in the abstract as 169,873); the figures of the witness Field showing 183,983 acre feet, and his own revision showing 165,837 acre feet for the months mentioned. It will be noticed that for the period covered by this table, that is, April to November, inclusive, Mr. Meeker is only 5,000 acre feet, in round numbers, higher than the published report of the State Engineer, although he admits that he knew that at the Boswell station the higher water passed through the three culverts which we have described and escaped measurement. The report of the State Engineer of the State of Colorado for the year 1912 was based upon the records of an automatic gauge which, as we have previously explained, was found by Prof. Carpenter to record less than the total discharge. Some corrections were made on some of the charts when this defect was noticed, but even if full correction was made, nevertheless the published record failed to include the water passing around the station. Assuming that that is the only error in the published record, nevertheless Mr. Meeker is palpably in error when he allows, on his revised figures based upon his so-called standard discharge curve, only 5,000 acre feet in addition to the 160,000 acre feet shown in the published record because, by actual measurements, Prof. Carpenter on June 4, 1912, found 500 cubic feet per second passing around the station and thereby escaping measurement; on June 11, 220 cubic feet per second, and at other dates various other amounts. Now 500 cubic feet per second is equivalent to approximately 1,000 acre feet per day, so that if the overflow of 500 cubic feet per second lasted for five days alone, it would amount to the total allowance which Mr. Meeker has given in excess of the erroneous record of the State Engineer. As a matter of fact, this overflow condition continued for more than four weeks and the total amount is indicated by the hydrograph prepared by Prof. Carpenter and previously referred to, Exhibit 158. It is approximately 28,500 acre feet.

Prof. Carpenter's measurements on the Little Laramie which were submitted to the witness are likewise criticised and two tables are put in evidence, T-5 giving a portion of the run-off for the year 1912, and T-6, a portion of the run-off for the year 1913, in connection with this criticism. We are unable to understand upon what the criticism is based, except that the witness disagrees with Prof. Carpenter.

In criticising the witness Field, Meeker states (4293) that Field, in his compilations, had used Meeker's figures when they were higher than the Colorado records and the Colorado records were higher than the Meeker records. This, however, is not borne out by Mr. Field's testimony which was to the effect that if he had used all records, his conclusion as to the flow at the state line would have been higher than he found it.

Exhibit T-7 is a continuation to the 15th of May, 1914, of the measurements made at the Pioneer Dam on the Laramie River and supersedes Exhibits B and I. This was, as will be shown later, afterwards corrected. A table, T-8, was later introduced, showing a continuation of the measurements made by the witness Meeker on the Little Laramie River, superseding Exhibit J.

In answer to a question as to his opinion as to the character of the years 1912 and 1913 with respect to the relative amount of flow of the Big and Little Laramie Rivers as a result of his measurements and observations for these two years and comparison of such records as were available for other years, the witness states:

> "Based on a review of the flow records taken only in a general way and other hydrographic information, I have concluded that the year 1912 was slightly above normal in the Laramie River basin and that roughly, the normal at Wood's Landing station or Pioneer Dam for a normal year is approximately 200,000 acre feet, and that the year 1913 was a trifle above 50 per cent of normal." (4296.)

In making this comparison, the records of the North Platte River at Saratoga, Wyoming, were considered, as heretofore stated. It will be observed that this conclusion of the witness, in so far as we have been advised of the method by which it was reached, is based entirely upon his own measurements shown by the Exhibits B, I and T-7 on the Big Laramie, coupled with a criticism, rather than a use of all other known records. Although he contended that he had reviewed other records, he failed to mention what they were or by whom made, nor how criticised. Witness admits that the automatic register maintained by the State Engineer of Colorado in the years 1911 and

1912 at the Boswell station was not registering the full amount of the discharge (4302-4303).

The estimate of Mr. Field of 12,800 acre feet per year as the normal run-off from the mountain territory along the west of the valley, discharged principally through Four Mile, Seven Mile, Cooper Creek and Mill Creek and other small streams, is criticised by Mr. Meeker with the statement that only a small portion reaches the stream, but he admits that most of this water is diverted before reaching the river and applied to lands along these creeks. The defendants contend for the purpose of this case that it makes no difference whether the water is used for irrigation along the creeks or whether the water is diverted for irrigation after it reaches the main stream. We are in no wise concerned with the location of the land under irrigation, except that it be in Wyoming (4304).

Mr. Field's estimate of 12,800 acre feet as being the normal discharge of the mountain area on the east side of the Laramie Plains is also criticised, although it is stated that Soldier Creek, Willow Creek and Five Mile Creek do contribute some water to the river. It is said, however, that from a point opposite Two Rivers northward to the Wheatland Reservoir there is practically no water from this drainage area that reaches the stream, but it is stated that this run-off is intercepted by lakes and ponds lying between the river and Black Hills and some is intercepted by the Oasis and Boughton ditches. (4306.) There is also irrigation from Soldier, Five Mile and Willow Creeks (4350). Again, we contend that if the water is intercepted either by ditches or by lakes and ponds, it in no wise negatives our argument that it is a source of supply, although it may not actually reach the Laramie River.

Mr. Field's statement, based upon the records of the State Engineer of Wyoming for 1911 and 1912, that 18,300 acre feet is discharged by Chugwater Creek, is likewise criticised because it is contended that this water does not reach the Laramie River but is used for irrigation along that stream above its mouth. Respondents likewise are in no wise concerned with the location of the irrigated area. We are the defendants in a case brought by the State of Wyoming, not by the appropriators of water on the Laramie River or on one of its tributaries. Chugwater, according to the Wyoming records, furnishes that amount of water, it is a natural tributary of the Laramie River, and we are in no wise responsible whether the water is used along Chugwater Creek or whether it is allowed to pass into the Laramie River below the Uva Station and thereby be allowed to escape (4307).

Moreover, the witness admits, on cross-examination, that a reservoir is proposed in the vicinity of Iron Mountain on

Chugwater Creek for the impounding of water from that stream (4353).

The witness then charged that Mr. Field, in his tables, had made a duplication of 17,700 acre feet in the year 1912 and 12,000 acre feet in the year 1913, but later, on cross-examination, as we have previously stated, he was compelled to correct this statement and admit that the error of 17,700 acre feet for the year 1912 was his own and also that there was no error in the 1913 record (4322).

Witness again reverts to storage and states, over the objection of defendants, that he finds the capacity of Wheatland Reservoir to be 83,400 acre feet. Based upon that capacity, that reservoir had in active storage on May 15, 1914, 58,000 acre feet; on the same date, Lake James had 21,400 acre feet and Lake Hattie 26,500 acre feet (4310). This is significant in view of the fact, as will be shown later, that at the date upon which the witness testified, the high water in the river had not yet been reached.

The witness speaks of the value of the Wheatland No. 2 Reservoir, which, because of the fact that it is built across the channel of the river, intercepts all seepage and waste waters from irrigation above (4319), and, on cross-examination, admits that, because of the topography of the country, no such reservoir is possible below irrigation on the Poudre River (4353).

On cross-examination the witness admitted that his error of 17,700 acre feet, which he first attributed to Field, ran through three tables introduced at different times, produced by himself, that is, Exhibits B, I and T-7, and that his mistake was never discovered until his criticism of Mr. Field was challenged (4324). He was also compelled to admit that an error was present in his Exhibit T-2, which he had just produced as a criticism of Professor Carpenter's measurements at Boswell station and in which he sought to give the discharge through the culverts in which the flow escaped measurement. On this table he gives the discharge at a gauge height of 3.65 as 480 cubic feet per second, whereas, according to his own discharge curve, it should have been 580 cubic feet per second, making the total discharge of the river at that gauge height 2,300 cubic feet per second instead of 2,200 cubic feet per second as indicated on the table, which, however, was corrected to meet this objection (4332).

He further admits receipt of a letter dated April 3, 1914, from Robert Follansbee, District Engineer of the United States Geological Survey, in answer to a letter of his own relative to high water measurements at the Boswell station made by the Geological Survey in the year 1911, which, inasmuch as their accuracy had been questioned, were made the subject of remeasurement on September 1 and 2, 1913, at which time Mr.

Follansbee ran levels to determine the approximate gauge height at which the overflow through the culverts would begin, and from which Mr. Follansbee found that the main overflow began approximately 1,050 feet up stream above the gauge, that the overflow would commence in the lowest overflow channel at a gauge height of 2.4, although it would not flow through the main overflow channel until it reached a gauge height of 3 (4334-4335). This measurement by the United States Geological Survey corroborates Professor Carpenter, who testified that on the night of the 30th of June, 1912, with a gauge height of 3, the overflow was imminent and that on the next morning, at a gauge height of 3.4, the overflow had occurred, so that it was apparent that the flow through the overflow channels began between the gauge height of 3 and the gauge height of 3.4 (3802). At any rate, Mr. Follansbee proves that Professor Carpenter is conservative.

Lake Hattie, according to the witness, had, on May 23, 1914, 26,500 acre feet available in storage and, although there was at that time approximately 1,400 cubic feet per second passing the Pioneer No. 2 Dam, yet no water was being stored in Lake Hattie, the reason assigned being that the superintendent had planned to finish some work on the dam which had remained unfinished in 1913, but, upon being pressed, admitted that the reservoir had sufficient water stored for use during the year 1914 (4345-4347), and that although the high water and flood stage of the river, which was late in the year 1914, had not yet been reached, in other words, was in prospect on the date upon which the witness testified, nevertheless, based upon snow reports and other information in reference to the condition of the watershed, the witness predicted that the year 1914 would be a year of very much greater flow than the year 1913 and would probably equal the year 1912 (4348). As a matter of fact, the winter of 1913 and 1914 was one of rather heavy snowfall throughout the Rocky Mountain area, although until late, the year 1913 had been a year of very low precipitation. The heavy snow came too late to be included in the measurements of the flow of the streams for 1913 concerning which Mr. Field and Professor Carpenter testified, while the witness Meeker, on rebuttal, was able to include some measurements of this flow.

THE AMOUNT OF LAND IRRIGATED.

It next becomes of interest to consider the amount of land irrigated, both in the Poudre Valley from the Poudre River and in the Laramie Plains and the so-called Wheatland area from the Laramie River. The amount of land irrigated

in the Poudre Valley is, of course, not an issue, except as it becomes so indirectly in a consideration of the necessity for water from the Laramie River, whereas, on the other hand, the amount of land irrigated in Wyoming from the Laramie River is directly in issue.

Irrigated Land, Poudre Valley.

No definite survey of the irrigated lands in the Poudre Valley was made. However, testimony of many persons familiar with the valley was taken and the figures given, it must be borne in mind, do not include the lands within the territorial limits of the Greeley-Poudre Irrigation District. The District lands amount to 125,000 acres, although there are more than that within the territorial confines of the district which are not, strictly speaking, district lands. Eliminating, then, the 125,000 acres within the district which it is proposed to irrigate but which is not now irrigated but is awaiting reclamation, we find from the evidence presented that the amount of land under irrigation in the Poudre Valley is approximately 300,000 acres. This amount, however, is what we might term the gross amount, with this explanation, that a quarter section under irrigation is called 160 acres, whereas, in truth, there may be a small portion of that quarter section devoted to buildings, barn yards, etc., which is, strictly speaking, not irrigated, if irrigation were counted by the amount of land devoted to crops under irrigation. Likewise the highways, which, of course, are not irrigated, would have to be deducted in order to get the net amount of irrigation. With deductions of this kind, the witnesses seem to agree that the actual net amount under irrigation is approximately 265,000 acres.

Mr. Wortham, the engineer of the Greeley-Poudre Irrigation District, places it at 275,000 acres (2134).

Mr. John L. Armstrong, the water commissioner for the Poudre Valley, states that the gross amount is from 305,000 to 310,000 acres; that, pursuant to the law, in 1912 he reported, by actual crop areas, 240,000 acres, but that amount did not include certain lands which were irrigated by seepage and return water nor a few very small ditches which he did not take into consideration, neither did this figure of 240,000 acres include lands covered by highways, barn yards and similar things, nor lands lying fallow; it is the net amount, determined by the actual areas devoted to actual crops irrigated by the ditches, with the exceptions mentioned, diverting water from the Poudre River. (2499.) His testimony was that at the date thereof there was an actual net amount under irrigation in the Poudre Valley of from 240,000 to 250,000 acres (2500).

Mr. J. F. McCreery, a witness for the defendants, who

had been devoting his time to the gathering of agricultural statistics and similar lines of work for the Greeley Commercial organization, testified that there were approximately 305,000 acres under irrigation in 1914 (3185).

Mr. A. A. Edwards, another witness for the defendants who had been for many years connected with irrigation enterprises in the Poudre Valley, fixed the number of acres irrigated at from 275,000 to 300,000 acres (2190).

Prof. L. G. Carpenter estimated the amount at 270,000 acres actually under irrigation (2294), and Mr. Field, the State Engineer, fixed the gross amount at approximately 300,000 acres and the net amount at from 250,000 to 275,000 acres. For the purpose of ascertaining the duty of water in the Poudre Valley, he took the figure 265,000 (3413-15, 3735).

Therefore, speaking of the irrigated area of the Poudre Valley, we believe the evidence justifies the statement that there is approximately 300,000 acres of land under irrigation, with the understanding that this includes a small portion of land in each section devoted to highways, buildings, barn yards and similar things, and in treating the question with respect to the amount irrigated from the Laramie River, the same method will be pursued, that is to say, we will speak of the gross amount of irrigation rather than the net amount as these two terms are here defined.

Irrigated Lands, Laramie Plains and Wheatland District.

For the sake of convenience, we will divide the Wyoming area irrigated by the Laramie River or its tributaries into two divisions, that lying to the east of the Black Hills, which we will term the Wheatland Tract, although, as a matter of fact, the original Wheatland tract is not all that area to be considered, and, second, lands lying within the Black Hills called the Laramie Plains.

There is no serious conflict in the testimony as to the amount of land under irrigation in the Wheatland area. The original Wheatland tract, according to the Wyoming testimony, was a desert land project, the undertaking dating from 1883 (70), and including 60,000 acres of land. In 1913, when the taking of evidence commenced, approximately fifty per cent of this was actually under cultivation (69).

M. R. Johnson, who had been for several years the superintendent of the company, placed the actual amount of irrigation at from 35,000 to 40,000 acres of land (5), whereas J. A. Elliott, another witness for the complainant who succeeded Mr. Johnson as superintendent, places the amount at 33,544 acres (168). He did, however, make an examination of a map prepared by the defendants, Exhibit 2, which showed the actual

amount of land under irrigation in this district, and testified (195) that this map "is substantially correct," and according to this map, the actual amount in the original tract under irrigation, without any deductions for roads, barn yards or similar things, and excluding the town of Wheatland, is 28,623.75 acres.

The complainant contends that as the settlement in the Wheatland tract began, they found themselves, in the absence of reservoirs, short of water during the period of low flow in the stream, that is, during the latter part of the irrigation season, and it was to supply late water that they built, first, the reservoir located upon the Wheatland tract known as Reservoir No. 1, which we have previously described, with a capacity of 7,000 acre feet, and also the large reservoir commonly called the Wheatland Reservoir and known as Wheatland Reservoir No. 2, with a capacity, according to Mr. Johnson, and Mr. Elliott, of 126,000 acre feet, and which was completed about 1900 and was supposed to have been necessary to relieve the situation occasioned by the shortage of water in the late season on the original Wheatland tract. It is significant, however, that, according to Mr. Johnson, the amount of land under irrigation at the date of the construction of the larger Wheatland Reservoir, that is, 1900, was only about 10,000 acres, and yet their reservoir capacity, in addition to the amount of water available by direct flow through the ditches, was 133,000 acre feet. It is therefore not surprising to learn that the company owning this system of works and undertaking the development of this tract of land, should later be looking about for additional areas upon which to put the vast amount of surplus water which they had available. Accordingly, two other tracts of land were filed upon, one almost immediately adjoining the original Wheatland tract on the southeast, known as the Bordeaux Tract, and another almost adjoining the original Wheatland tract on the northwest, called the Sybille or Cooney Hills tract. These last two tracts, that is, the Bordeaux and the Sybille tracts, are what is generally known as Carey Act lands. The Bordeaux tract contains 10,000 acres and the Sybille tract 30,000 acres (168-9). Although promoted by the same persons, generally speaking, as those who promoted the original Wheatland tract, they were not in contemplation at the time of the formation of the original project, nor, as a matter of fact, were they in contemplation when the Wheatland Reservoir was constructed (42). They seem to have been an afterthought, arising out of the abundant quantity of water made available by the construction of this extraordinarily large reservoir.

In the year 1913, no lands in the Sybille tract were under irrigation whatsoever. As a matter of fact, the ditch leading from the main distributing system for the Wheatland tract was

not fully completed, although the surveys had commenced in August of 1907 and construction work commenced in July, 1910, and there was under irrigation in the Bordeaux tract, according to Mr. Elliott, 1,004 acres (168), but according to defendants' survey, Exhibit 2, 451 acres. The survey for the ditch leading from the main system to this tract was commenced in February, 1904, and construction work in June, 1907.

It therefore becomes apparent that the promoters of this enterprise, in the year 1904, found themselves in a position to supply more water than the lands included within the original Wheatland tract for which the irrigation system had been constructed, needed, and they therefore, as an afterthought, began the project in 1904 called the Bordeaux tract, containing 10,000 acres and three years later, in 1907, began the surveys for the second after-project, the Sybille tract, containing 30,000 acres of land.

It therefore appears that at the date upon which the taking of evidence was commenced we have the original Wheatland tract, containing 60,000 acres of land, dating from 1883, which had in thirty years' time been developed only to the extent of fifty per cent, and while they had approximately fifty per cent yet to colonize and develop, nevertheless the same company undertakes the development of two other projects, containing, in the aggregate, 40,000 acres additional, but out of the whole 100,000 acres, dating from the three respective dates, upon which these projects were commenced, we find that they actually had under irrigation, according to Mr. Elliott, the superintendent of the company, a total amount of 34,544 acres (168), and according to the defendants' survey, 29,074.75 acres (Exhibit 2). There is no material difference in the testimony presented by the complainant or the defendants on this acreage, and it is unnecessary to indulge in any nice distinction as to whether the amount is 34,000 or 29,000. Probably the latter figure is correct, because it was based upon a definite survey, and we believe Mr. Elliott's statement to have been based upon a more general estimate.

Turning now to the Laramie Plains area, we find more difficulty in arriving at the exact acreage under irrigation. General estimates were given by various persons who testified as to the amount of land under irrigation under various ditches, but none of these are based upon a definite survey of the lands. Realizing the necessity of accuracy in this regard, the defendants, as early as possible, undertook the survey of the irrigated area in the Laramie Plains. This survey was made by a party in the field and the instrument employed was a plane table, this being an instrument of recognized merit, used by surveyors generally, including the United States Government in making both topographical and geographical surveys. The party com-

menced at Wood's Landing and worked down stream past the City of Laramie, on past the junction of the Big and Little Laramies for a distance of five miles due north, and thence back up the Little Laramie to Filmore, that being the point where the river emerges from the mountains and corresponds in a measure to Wood's Landing upon the Big Laramie River.

This survey was made of these lands in detail and an accurate map or plat was made in the field, showing every character of cultivation in the area surveyed. However, time did not permit of the completion of the plat, although the survey itself covered practically all of the irrigated lands in the Laramie plains, the only ones omitted being what might be termed the fringe on the edges of the main cultivated areas. In other words, practically all of the irrigated area in the Laramie plains was surveyed and the major portion was platted in such a way that the plat shows each tract of land, the character of cultivation, the division fences, the exterior ditches but not the interior laterals, and a classification of lands devoted to different uses. A photographic reproduction of this plat is introduced in evidence, Exhibit 114, and to this exhibit we respectfully request the consideration of the court. It will be apparent at once that this exhibit, as well as many others which were offered in evidence, could not be duplicated in the record, and we therefore pray the indulgence of the court in filing but one of each of these various exhibits.

Each page or sheet of the exhibit shows, in general, six sections. The first few sheets are the plats made of the survey near Woods Landing, and the sheets are numbered according to the numerical arrangement of the sections in their respective townships. Confusion will be avoided if the key map in the fore part of the exhibit is consulted, inasmuch as this key map will show the plat in the exhibit covering any specific section or sections desired.

For the sake of clarity, we will explain that the portion covered by the survey, but not platted, includes the irrigated area on the Little Laramie River from Filmore down to a well-known road, frequently mentioned in the testimony, called Sprague Lane. Generally speaking, the area surveyed but not platted was that portion of the territory under irrigation lying along the Little Laramie River where it runs diagonally across Township 16 North, Range 76 West, and a glance at the map attached to the answer of the corporate defendants will readily disclose to the court the area in question.

This survey was made with all possible care, although time prevented the doing of many things which defendants would have wished to do in acquiring a complete knowledge of the situation. But, with the exception of the fringes on the outside of the main irrigated area, this survey showed with the

accuracy of a survey, the total number of acres under irrigation, the total number of acres in meadow, in grain, in alfalfa, or in any other crop, and also classified the meadow lands into first, second and third class, or instead of third class, as termed by the Wyoming witnesses, irrigated pasture.

Counsel for the complainant endeavored to find inaccuracies in this plat, but, when the vast amount of land included in the detail of the survey is considered, it is significant that in only four instances was the complainant able to show even immaterial inaccuracies in this survey, none of which were at all important, and they are disclosed by a resurvey of certain specific sections as shown by the complainant's exhibits, S-1, S-2, S-3 and S-4.

This survey was made under the immediate direction of Mr. Field, the State Engineer, the party being in charge of the Deputy State Engineer, Mr. Emmett C. McAnelly, and the instrument being operated by George P. Woodhall, all of whom are witnesses for the defendants.

Upon the presentation of the evidence in chief, the complainant introduced a table, Exhibit E, purporting to show the irrigated lands on the Little Laramie River. This table was prepared by Mr. Meeker after a reconnaissance made by him and one assistant. He testifies that at times distances were measured by the speedometer upon the automobile in which he was traveling (988). Exhibit E attempts a classification of the lands in question into meadow, pasturage, oats and alfalfa, and summarizes the total as being 49,553, although Mr. Meeker in his oral testimony, placed the amount at 48,344 (983).

This table includes lands irrigated on Seven Mile and Four Mile creeks, as well as on the Little Laramie itself, and also includes 11,611 acres lying above Filmore, the point at which the stream was measured and its flow determined by the witnesses both for the complainant and the defendant. We have previously explained that this land, lying largely in what is termed the Centennial Valley, was not taken into consideration in the irrigated section for the reason that no witnesses whatsoever added the water necessary for its irrigation to the flow of the stream found at Filmore, although one large ditch, the Loback Canal, heads on the north branch of the Little Laramie River and diverts, or is capable of diverting, a large volume of water. In fact, it was used in conjunction with the Bellamy Canal as an intake into Lake James. The canal, however, along its lower course, does irrigate some lands which are included in the irrigated area by the defense, although the water taken through the canal, as previously stated, is not charged to the stream. These lands above Filmore in question are as follows, according to Exhibit E: 832 acres in Township 14 N., R. 78 W.; 178 acres in Township 14 N., R. 77 W.; 6,711

acres in Township 15 N., R. 78 W.; 2,916 acres in Township 15 N., R. 77 W., and 974 acres in Township 16 N., R. 78 W. We therefore contend that in order to be consistent, this amount of 11,611 acres must be deducted from the irrigated area contended for by complainant.

The defendants introduced a similar table, Exhibit 117, prepared by Mr. Woodhall, and based upon the plane table survey of the Little Laramie area, containing a slightly enlarged classification from that prepared by Mr. Meeker. According to the plane table survey, the total amount of land under irrigation on the Little Laramie below Filmore, the point of the measurement of the stream, is 31,341 acres. Later reference will be made to the amount devoted to the specific crops in this area.

After eliminating the 11,611 acres above Filmore and comparing Meeker's figures with Woodhall's table for the land actually in controversy, we find that Meeker shows 37,942 acres against Woodhall's figures of 31,341, but inasmuch as Mr. Meeker included in this table 2,445 acres lying on Four Mile and Seven Mile creeks, which Mr. Woodhall puts in a different classification, the actual discrepancy between the two is 4,156 acres.

Mr. Woodhall's figures of 31,341 acres irrigated land on the Little Laramie below Filmore are based upon a definite survey. Mr. Meeker's figures were, according to his own statement, based merely upon a reconnaissance.

Passing now to the Big Laramie, we find that no definite statement of the total amount of acreage irrigated was attempted by the complainant. As already stated, various witnesses attempted to give in a general way the number of acres of land under certain ditches, but no definite evidence was introduced as to the total number on the river. Mr. Meeker made a reconnaissance of the lands under the Pioneer Canal, measurements being made merely by pacing the distances. (827.) This reconnaissance occupied him and one assistant five days—August 5th and 6th and September 18th, 19th and 20th, in the year 1913. By this method he arrives at the conclusion that the total amount under irrigation under the Pioneer Canal is 11,556 acres. (824 and 844.) Furthermore, he found evidence of at least 2,000 acres having been at some previous time irrigated, but now apparently abandoned so far as irrigation is concerned.

This testimony is significant when we consider the claims made by the complainant for the irrigation of lands under this canal. The Pioneer Canal was commenced about 1879, the oldest of the larger ditches diverting water from the Big Laramie in Wyoming, and in all these years this development is represented by the irrigation, according to Wyoming testimony it-

self, of only 11,556 acres, which is more than the survey made by the defendants discloses to be the correct amount.

Before proceeding further, however, let us digress to call attention to Exhibits N and O, offered by the complainant and to which objection is made by the defendants. These exhibits purport to give the adjudicated decrees on the Laramie and Little Laramie Rivers (Exhibit N) and on Soldier and other creeks (Exhibit O). Exhibit N, being the Laramie River decree, is admittedly not a final decree. The original decree was made by the Board of Control of the State of Wyoming, from which an appeal was taken to the District Court of Laramie County and from which an appeal was taken and pending undecided at the time the exhibit was offered in evidence. The defendants object to it for further reasons which need not be discussed here except to say that we contend that it is in no wise binding upon the defendants for the very obvious reason that they were in no wise parties to it, neither could they be parties to it. However, an examination of this exhibit shows that the Wyoming authorities had decreed appropriations under the Pioneer Canal under date of April 19, 1879, for the irrigation of 49,030 acres of land, and yet their own expert is able to find only 11,556 acres.

The plane table survey included the major portion of the lands under the Pioneer system. As to the area included, we insist that our survey is definite. However, we accept without question Mr. Meeker's estimated figures where we have not measured. Taking these, added to the amount which we actually measured, we find that the total irrigated under the Pioneer Canal is 10,605.8 acres.

Mr. Z. E. Sevison, another witness for the complainant, testified to the number of acres of land under the Oasis Ditch. Inasmuch as the plane table survey did not extend to the extreme limits of the irrigation of this ditch, nor to the extreme limits of the Boughton Ditch, neither did it include the irrigation of lands under three or four smaller ditches further down the river, including the Gillespie Ditch and McGill Ditch. We have taken the Wyoming testimony, whatever it may be, for the amount of lands irrigated there. In other words, wherever we have not made a measurement, we have taken the Wyoming testimony without question, although we know that where we have measured it and compared it with the Wyoming estimate, the Wyoming evidence has always shown a higher amount than our survey proved to be correct. The result is that we find that there is in the Laramie Plains area under irrigation from the Big Laramie, the Little Laramie, Sand Creek, Soldier Creek, Four Mile, Seven Mile and Cooper Creeks, and any other sources, the total of 78,999 acres, and this figure has been arrived at by a consideration of all the testimony intro-

duced by Wyoming without question except where actual measurement disproved its correctness.

At page 2792, Mr. Woodhall, testifying in this regard for Colorado, says that the total acres of land irrigated in the State of Wyoming in the Laramie Plains from the Laramie River and its tributaries is 90,610 acres.

The abstracting of the original testimony has been possibly too brief, but it appears from the original transcript, as well as from the abstract, if analyzed, that this amount, 90,610 acres, included everything in the Laramie Plains area, even that portion irrigated on the Little Laramie above Filmore, 11,611 acres, which we insist must be eliminated from consideration. In other words, the testimony, without contradiction, shows that in the Laramie Plains area below Wood's Landing on the Big Laramie, at which point that stream was measured, and below Filmore on the Little Laramie, at which point that stream was measured, the total amount under irrigation, including the amounts under the other tributary streams such as Sand Creek, Soldier Creek, Willow Creek, Four Mile, Five Mile, Seven Mile, Cooper Creek and any other sources of supply, is 78,999 acres. Included in this are the 31,341 acres under irrigation, classified by crops, actually measured and surveyed on the Little Laramie (Ex. 117) and also 29,279.3 acres actually surveyed and measured, by plane table survey, shown according to classification of crops, under the respective ditches on the Big Laramie (Ex. 118).

The Wyoming area under irrigation in the year 1913, upon a most liberal basis for Wyoming, therefore seems to be: Wheatland area, 29,074.75 acres; Laramie Plains, 78,999 acres; total, 108,073.75 acres.

This amount of land, 108,073.75 acres, is the amount for which Mr. Field, the State Engineer of Colorado, finds that there is available for irrigation a total amount of 431,200 acre feet of water per annum as an average, less only the amount diverted from the stream by the State of Colorado. In other words, less 20,000 acre feet per annum now diverted by Colorado through the Sky Line and Divide canals and the proposed diversion of 56,000 acre feet per annum through the Greeley-Poudre tunnel. Assuming that the Greeley-Poudre system is completed, we then have Colorado diverting 76,000 acre feet per annum, leaving as a total supply of water for the lands herein designated in Wyoming, 355,200 acre feet of water as the normal yearly supply for the irrigation of 108,073.75 acres of land, or 3.28 acre feet per acre.

Later we will have occasion to discuss the question of the duty of water and will review the evidence concerning it, but it is pertinent to say here that Mr. Meeker, testifying as an expert for Wyoming, states that the duty of water on the Lara-

mie Plains is 1 acre foot per acre per annum. If Mr. Meeker be correct, all the water needed for the irrigation of the Laramie Plains area now under irrigation is 78,999 acre feet per annum, and if the same duty pertains upon the Wheatland area, then the total quantity of water needed for all the Wyoming area would be 108,073 acre feet per annum, or only approximately one-half of the total amount which Mr. Meeker, the Wyoming hydrographer, states is the normal yearly flow of the Big Laramie alone at Wood's Landing, or approximately one-third of Meeker's combined flow of the Big and Little Laramie Rivers.

Now, as will be explained elsewhere in this brief, the Wyoming law permits a maximum diversion for irrigation of one cubic foot per second of time measured at the point of diversion for the irrigation of 70 acres of land. Let it be understood that this is the maximum contemplating the most adverse conditions requiring the greatest amount of water which might be found within the state.

According to the testimony of Mr. Johnson and Mr. Elliott, ex-superintendent and superintendent of the Wyoming Development Company, the irrigation period on the Wheatland tract was approximately ninety days, but the maximum quantity of water was used for only a very short period. During the irrigation season there were times when the demand was slight. This is universally true where irrigation is practiced. No irrigator needs the maximum all of the time. There will be occasions when he will need the peak flow or the maximum quantity; at other times he may need none, and at still other times he may need less than the maximum. In other words, the demand will be variable according to the conditions of his crops and the season of the year. The irrigation season in the Laramie Plains is, by reason of the altitude, shorter than the season at Wheatland. But, for the sake of illustration, let us assume that the irrigation season in the whole Wyoming area irrigated from the Laramie River is ninety days, and let us also assume a condition which could not possibly exist—that is to say, that they required the maximum amount of water which the law gave them every minute of the irrigation season. We then would find that under the Wyoming law the 108,073 acres under irrigation will be entitled to use 2.6 acre feet per acre, or a total of approximately 290,000 acre feet per annum out of a balance of 354,700 acre feet remaining above all Colorado diversions, that is, 76,000 acre feet. As a matter of fact, according to the testimony of the Wyoming witnesses, there was actually diverted to the Wheatland lands in past years more water than the maximum amount they could legally receive under the law of the State of Wyoming.

In fixing the irrigated area at 108,073 acres and the water supply therefor, less the Colorado diversions, at 431,200 acre

feet per annum, it must be kept in mind that this water supply is the average available for all lands above and including the Wheatland tract. It does not include the flow of the North Laramie nor of Chugwater Creeks, which, if added, would make a total in excess of 450,000 acre feet per annum, as we have previously shown, but this we have not considered here for the reason that there is some irrigation along the Chugwater Creek and also some irrigation upon the North Laramie which we have not included in the irrigated area given, these two creeks reaching the main river below the Wheatland tract.

In this connection may we call attention to a colored map introduced by the complainant as Exhibit G, which purports to show by different coloring the amount of land irrigated from the Laramie River in Wyoming.

The offer of this map was objected to by the defendants, because, among other things, it is entirely at variance with all of the evidence as to the amount of land under irrigation. It is particularly noticeable that general areas are colored to indicate irrigation, whereas, as a matter of fact, such areas were not, as shown by the Wyoming evidence, irrigated. The map purports to show, according to its legend, all irrigation development prior to 1900 in green, and all irrigation development subsequent to 1900 in yellow. Not only are the areas colored green not irrigated, except in part, but the evidence introduced by the complainant shows that only a small portion was irrigated even as late as the year 1913, and the same thing may be said of that portion colored yellow, which purports to be that developed subsequent to 1900. For illustration, the whole of the Wheatland tract of 60,000 acres is colored green, intending thereby to convey the impression that it was all irrigated prior to 1900, whereas the witnesses for the complainant testified that only fifty per cent of this tract was irrigated in 1913.

We do not desire to discuss the exhibit further at this time, except to say that it is not in accordance with the evidence in any particular, and to insist upon our objection to it as shown at page 1030 of the transcript.

DUTY OF WATER.

The term "duty of water" is variable and is used frequently to designate the quantity of water which is usually applied for irrigation upon any certain tract of land or upon a certain area. Many irrigators and hydrographers use the term in this sense.

We do not so understand it and do not intend to use it in that sense here. Neither will we attempt an exact definition

of the term, except to call attention to the word "duty." Unless the word "duty" is kept in mind, confusion will arise. It implies a burden upon water in that it specifies the amount of land which a given quantity of water should adequately irrigate, rather than the amount of water which a given quantity of land receives.

Therefore, when we say that the duty of water is higher, we mean that it accomplishes a greater use. In other words, irrigates a larger acreage. The natural assumption might be that higher duty meant more water, but with the word "duty" clearly in mind, it will readily be seen that the higher the duty the less water necessary for any certain quantity of land, and the lower the duty, the more water, or, conversely, the higher duty is the greater amount of land which the water will irrigate, and the lower duty the less amount of land which the water will irrigate.

May we suggest that confusion will be avoided if the court will keep in mind a catch phrase: "Higher duty, less water."

Duty of Water in Poudre Valley.

We have previously shown that the total supply for the Poudre Valley, including the water brought into the Poudre Valley from outside sources, based upon a long series of records, is approximately 367,000 acre feet per annum (Exhibits 123 and 124) (3410, 3411), and that an average of about 110,000 acre feet per annum passes out of the mouth of the Poudre into the Platte (3411), of which probably 50 per cent is seepage water and 50 per cent original water. (Exhibit 113 and pages 2487 and 2491).

We have also shown that the irrigated area in the Poudre Valley is approximately 300,000 acres of land without making deductions for roads, barnyards, etc., but treating the 300,000 acres as the total amount under irrigation, we therefore find that about 312,000 acre feet per annum is the consumptive use in the Poudre Valley, slightly more than one acre foot per acre.

However, we do not contend that one acre foot per acre measured at the point of diversion from the river is sufficient. 312,000 acre feet of water per annum measured at the weir where the river leaves the canyon would, in the absence of use and reuse of seepage and return water, not permit of the proper irrigation of that valley, because we have the unavoidable loss of water in transit not only from the head of the ditch wherever the diversion may be, but also from the point of measurement at the mouth of the canyon to the head of the ditch.

Individual ditches have diverted and do divert very much more than that which would supply one acre foot per acre measured at the land and these have been commented on to some

extent in the brief of the complainants herein. Referring to the testimony of John L. Armstrong, water commissioner for the Poudre Valley, which shows that some small ditches diverted as much as 2.94, some as much as 3 acre feet per acre, and still others as little as .59 acre feet per acre, it is manifest that the duty of water for an area, whether that area be the Poudre Valley or the Laramie Plains, cannot be obtained by analysis of the amount diverted by any one small ditch, but must be taken either by analysis of the total amount of water with respect to the total amount under irrigation, or possibly be taken on a ditch which is typical of the whole area, using that as a criterion. Probably this last method is not as accurate as the first. However that may be, we have frequently referred to two canals in the Poudre Valley, one of them being the Eaton Ditch belonging to the Larimer and Weld Irrigation Company, the construction of which was commenced in 1879, the same year in which the Pioneer Canal was commenced, the other being the Larimer County Ditch belonging to The Water Supply and Storage Company dating from 1881. These two canals, inasmuch as they are large and in a general way run throughout the length of the irrigated area of the Poudre Valley, are, in a measure, typical.

We have definite evidence as to the duty of water, measured at the headgate, under the Larimer County Canal. Mr. A. A. Edwards, for many years the superintendent of that company, fixes this duty at one acre foot per acre for diversified crops such as are commonly raised under that ditch, measured at the headgate of the lateral leading from the ditch (2222), which would necessarily mean a higher duty at the place of application, but if fixed at the point of diversion from the river, it would be lower, because of the necessary loss in transit. The amount diverted by this canal from the river is approximately 1.2 acre feet per annum for each acre of land irrigated. (3415.) The duty under the Eaton canal, which is a canal very similar to the Larimer County Canal, is about the same. The Eaton ditch dates from 1879, the same date as the Pioneer Canal in the Laramie Plains, while the Larimer County canal is about two years junior. These two canals being among the older of the larger canals in the valley and irrigating what is, as a whole, a well developed section, are typical of the high state of development of irrigation in the Poudre Valley, and probably typical of the duty of water of the valley as an average, although some areas under other ditches require less and some more water.

The method of adjudication of priorities of right to the use of water has been explained elsewhere, but, in this connection we desire to state that the earlier decrees in the Poudre Valley are, as a rule, excessive. By that we mean that a larger

number of cubic feet per second was adjudicated to be the right of the canal than was actually needed or, at any rate, than is now actually needed for the original area irrigated. This seems to be the rule in all pioneer districts. Two causes may be assigned. In the first place, inasmuch as some of the canals in the Poudre Valley have dates earlier than 1870, at which time the science of irrigation was not as definite as it is today, it is probable that many persons making claims for these rights did not know with any degree of exactness what amount of water one cubic foot per second would produce. Doubtless the estimates given in the earlier days were very general and the natural tendency would be to over-estimate the number of cubic feet which a ditch could carry rather than to under-estimate it. But, lest we impeach too strongly the judgment of these pioneers, it is a fact that the duty of water in the Poudre Valley has been steadily and probably constantly increasing. Less water is used proportionately today than was used years ago. This tendency is very apparent. There is no conflict in the evidence concerning it, and therefore no need to refer to the specific testimony.

An examination of the evidence shows that probably every other irrigated section has undergone or is undergoing the same experience. The fact that excessive appropriations were made in Wyoming clearly appears in the testimony introduced, and there is no reason to believe that the duty of water in that area, as irrigation continues, will not increase, and in the future they will need very much less water for the irrigation of the same amount of land now under irrigation than they use today or that they need today. We use the alternative for the reason that we believe that in Wyoming they are now using more water than is necessary for proper irrigation.

Reverting again to the Poudre Valley, inasmuch as the irrigated area is susceptible of practically definite determination, and inasmuch as practically all the land under the ditches now constructed is irrigated more or less efficiently, depending upon the available water supply and the rights of the various ditches thereto, it is comparatively easy to fix the duty of water, knowing, as we do, the normal flow of the Poudre River.

As we have stated, this normal flow available for the Poudre Valley is approximately 312,000 acre feet per annum, based upon an average of thirty years' records, measured at the mouth of the canyon, and, in general, the number of acres irrigated is about 300,000 acres. Considering the use and reuse of seepage and return flow available, the amount of water used would therefore seem to be slightly more than one acre foot per acre, determined at the point of measurement on the river, and probably materially less if measured at the point of application of the water to the lands. Generally, we consider the duty of water in the Poudre Valley as one acre foot per acre, experience

showing that as an average this amount of water applied to the land will be sufficient for successful irrigation, provided, of course, the supply is so controlled as to make it available at the proper time. Therein lies one great advantage of storage reservoirs and a system of administration such as prevails in the Poudre Valley, whereby exchanges can be made between reservoirs or between reservoirs and ditches in order to get water at the proper time and at the proper place.

Great stress is made by the complainant in its brief upon the question of the time of use, the contention being that during the late summer and fall, at which time a relatively greater portion of the total flow of the Laramie River would be diverted, according to the complainant, by the Greeley-Poudre tunnel, there is a shortage of water in the Laramie River. Therefore, they contend that the diversion by the Greeley-Poudre system at that time of the season will deprive them of water which is necessary for the irrigation of their hay meadows and other crops. But, according to their own witnesses, they have been short for years at that season of the year, and we suggest that, regardless of any diversion by Colorado, they would always be short at that season of the year if they did not take advantage of the opportunity given for the storage of flood waters coming earlier in the season.

The Poudre Valley would not have been able to irrigate one-half, probably not one-third, of the amount of land now under irrigation if it depended upon the direct flow of the stream for irrigation. In the arid regions the streams always fall early in the summer and the flow, as a rule, decreases as the year advances. It is only the ditches of the earliest priorities in the Poudre Valley for which there is any available water from midsummer on, if the direct flow of the river alone is depended upon, but in all these mountain streams, in the arid area, there is a flood season, coming, as a rule, late in May and early in June, at which time water for irrigation is not needed as much as it is later in the year when the streams are lower. It is the storage of this flood water which has made the Poudre Valley what it is today. The irrigators in that section have taken advantage of every feasible opportunity for the construction of reservoirs, and practically all available water which engineering science will permit to be stored at a cost which will be justified by the returns, is now stored, or, at any rate, will be stored with the completion of the works of the Greeley-Poudre system. Are we asking anything unreasonable when we contend that Wyoming should use every reasonable means for the storage of the flood waters of the Laramie River? Have we any right to expect that the needs of mankind are to be disregarded to the extent of permitting Wyoming to deny a demand on the part of Colorado for a small frac-

tion of the Colorado water flowing in the Laramie River while Wyoming neglects to avail herself of every reasonable opportunity of conserving a supply which is available in greater quantity than her needs today and for years to come will require?

Several witnesses for Wyoming, living under some of the older ditches on the river, testified that during the summer season of 1912 they were short of water, and again in 1913 they were short of water. We have shown the very inferior quality of works by which the older ditches in the Laramie Plains divert water from the river; some had no dams at all, others had dams constructed of anything which happened to be available, rubbish, brush wood, manure, piles of loose rock, anything which came handiest, was used. Head gates in many instances, if they could be termed head gates, higher than the bed of the stream. In short, many of the older ditches in Wyoming were in no wise equipped to divert water if it was available in the stream, and it is not at all surprising that at times they may have been short of water, but this we believe to be manifest, if there had been, as a rule, a shortage of water, two things would have been apparent; in the first place, adequate diversion dams and diversion works would have been constructed, and, in the second place, there would have been a definite administration by the officers of the state whose jurisdiction it is to apportion the water according to the rights of the various ditches, and we find from the Wyoming testimony, of which we will have more to say under the head of "Administration," that all sort of regulation upon the part of the water commissioners of the various districts or other superior officers has been unnecessary, or, if not unnecessary, then it has been entirely neglected and the universal statement of Wyoming witnesses was that they took the water whenever they wanted it and as much as they wanted to the capacity of their ditches whenever it was available, without let or hindrance upon the part of any officer whatsoever and without regard to any prior appropriator.

Now, of course, the Laramie River is low from midsummer on, and it is not to be wondered at that under normal conditions some ditches depending upon the direct flow of the river might be short of water, but let us look a little farther. The complainant introduced a table, Exhibit K, purporting to give a resume of the stored water in the years 1912 and 1913, and from this statement we learn that in the year 1912 Lake Hattie commenced to store water from the Big Laramie River on the 8th day of April and from the Little Laramie River on the 4th day of June, and continued to store water from the Big Laramie River throughout not only the irrigation season, but practically throughout the year, and continued to store water from

the Little Laramie River until August 10th; that in the year 1913 Lake Hattie commenced to store water from the Big Laramie River April 25th, and continued until the 13th of June.

And from this same exhibit we find that Lake James storage commenced in 1912 upon the 21st day of April and ceased upon the 3rd day of August; that in 1913 storage commenced upon the 19th day of April and continued until the 25th day of May.

It is not surprising that ditches depending upon the direct flow of the Laramie River were short in the year 1912. As we recall it, these complaints were made by witnesses living under ditches having priorities earlier than Lake Hattie. They complained they were short of water and yet Lake Hattie continued to store without ceasing all during the irrigation season and no officer of the State of Wyoming raised so much as a protest against it. The same is true of Lake James. In the year 1913 the condition was not quite so bad, but nevertheless Lake Hattie continued to store until June 13th.

How can the complainant justify its claim that the little ditches were short of water in the face of these conditions? Either there was no shortage of water and the little ditches received their supply, regardless of Lake Hattie's storage, or there was a palpable violation of the law upon the part of the Laramie Water Company, the owners of Lake Hattie. We have previously shown that 1912 was approximately one of normal water supply. If Lake Hattie can store during the irrigation season of 1912, we can see no reason why it should not store during the irrigation season in any normal year. Let us suggest that in the Poudre Valley no such condition of affairs would have been tolerated for a single instant. In Colorado, no reservoir is allowed to store as long as any ditch, be that ditch either senior or junior to the reservoir, demands the water for direct irrigation. The reservoirs in the Poudre Valley are permitted, and this has been the custom since reservoirs were built there, to store only when there is a surplus above the amount needed for direct irrigation by all ditches, and many a Poudre Valley reservoir has been compelled to forego storage of water which was available in the Poudre River because a demand was made for that water by ditches using water for direct irrigation on the lower South Platte. We do not state this as a proposition of law, but as a question of fact, as a condition under which storage in the Poudre Valley has been accomplished, and the rule of practice to grant the junior ditch water for direct use against a senior reservoir has been the established rule of administration in Colorado, although it is possible that it may ultimately be otherwise determined as a matter of law.

Duty of Water, Wheatland Area.

The duty of water on the Wheatland area, in so far as the application to the land is concerned, should not be abnormal. So far as developed, the area is devoted to somewhat diversified farming. The average altitude is approximately 4,700 feet above sea level, and we see no reason why conditions there should not follow the general rule of irrigated districts, and we have no doubt whatsoever that experience will disclose that the duty of water will be increased from year to year. However, no shortage of water is apparent upon this area, at any rate, since the construction of their reservoirs. Rather, they have had more water than they needed.

We have stated that the original Wheatland tract was a Carey Act project, and in the early history of that project we find that the promoters actually turned water loose upon the bare naked prairie, claiming thereby that they would increase the natural growth of the prairie grass. These were not hay meadows, they were but prairie lands which are common to the area to the east of the Rocky Mountains. No further explanation was made. We do learn, however, from their own testimony, that they had considerable difficulty in securing the approval of the Government and that for a number of years their patent or patents were withheld. We are prone to wonder whether the reclamation required by the law of Congress, commonly known as the Carey Act, as a prerequisite to patent, was claimed to have been accomplished by pouring water upon prairie lands, but, dismissing that, it is apparent that they had more water than they needed for legitimate irrigation.

We learn that they have approximately 29,000 acres under irrigation, but let us take their own estimate, in round numbers, and call it 33,000 acres under irrigation, including the small amount in the Bordeaux tract. M. R. Johnson, at one time superintendent of the system, testified (91) that the irrigation season ordinarily is from 90 to 100 days, during which period the water is applied more or less constantly and in greater or less amount, depending upon the needs of the crops. This is confirmed by the testimony of Mr. Elliott, the superintendent succeeding Mr. Johnson, who also testified (170) that in the year 1912 100,000 acre feet of water was used for the irrigation of this amount of land, and, nevertheless, they had 40,000 acre feet left in the Wheatland Reservoir at the close of the season. In other words, they used three acre feet per acre that season, whereas, under the Wyoming law, if they had applied the full maximum amount which the law permits, continuously without diminution for a period of 90 consecutive days, they would have diverted only approximately 85,000 acre feet. It therefore appears from their own testimony that the

Wheatland people diverted, during the year 1912, 15,000 acre feet more than the maximum permitted by the law of Wyoming for the most extreme conditions in that state. No such demand as that permitted by the maximum amount under the Wyoming law is possible. That tract manifestly does not need the maximum quantity of water allowed throughout the whole irrigation season.

Mr. Johnson testifies (94) that since the original construction of the tunnel and the diversion of water through this system, they have never been interfered with by the authorities of the state, but have taken water when and where they would, with only one exception and that was in the year 1911, when they were directed to allow some water to pass their diversion dam for the use of persons below. Again, we learn from the testimony of Mr. Elliott (212) that the net distribution of water to the Wheatland lands in 1912, was from 2.6 to 2.7 acre feet per acre, determined by actual deliveries at the head of the laterals leading to the lands. It is therefore apparent that the Wheatland system has had available not only an excessive amount of water, part of which, in a normal year it was unable to use, but also the amount distributed, measured at the head of the lateral ditches, amounted to from 2.6 to 2.7 acre feet per acre, or more than two and one half times the amount of water correspondingly used in the Poudre Valley.

Mr. Field testifying for the defense, in reviewing the tendency heretofore mentioned, concerning the increase in the duty of water as irrigation developed, particularly where necessity required it, says (3572) that he would expect that if economy ever became necessary in the Wheatland district, the duty of water would not exceed one and one half acre feet per acre, measured at the head gate of the canals, and that there need be no increased diversion over the amount at present diverted for the ultimate irrigation of the entire unirrigated land now proposed to be irrigated.

Duty of Water, Laramie Plains.

When we consider the Laramie Plains, we again find more difficulty in arriving at the true conditions. This area seems to be abnormal from many view points. No attempt whatsoever was made in the presentation of the case in chief to establish a duty of water in this area, but from various witnesses we learn that the principal crop in the Laramie Plains consists of native hay. The average altitude of these plains is about 7,100 feet above sea level, and the history of the area shows that it has failed to become a farming region. In so far as the area is irrigated, by far the greater portion, in fact almost all, is devoted to the growth of native hay. The testimony shows

that the practice in the irrigation of these hay lands is to apply the water copiously, to flood the meadows and keep them constantly flooded until it became necessary to shut off the water in order to permit the ground to dry sufficiently to permit mowing the hay. Under this system, there are few lateral ditches, but the water is applied until the whole country devoted to hay meadows is flooded, advantage being taken of draws, depressions and so forth, for the distribution of the water. On the Little Laramie the water is spread out through a number, five or possibly seven, different channels of the river, dams of manure or any other convenient substance being placed here and there to divert the water out of the channels.

The complainant, in its brief, says that this is the only sort of irrigation possible under the circumstances; that inasmuch as hay meadows are not cultivated, they do not lend themselves to systematic irrigation as where the water is distributed through the furrows in cultivated fields. To a limited extent this may be true, yet it does not excuse the fact that the most primitive methods have always been used and still prevail for the irrigation of these hay meadows on the Laramie Plains, and it is a fact that for weeks these lands are practically swamps, saturated until a remarkable condition described by one Wyoming witness appears. This witness testified that boulders appearing upon the lands so brought under irrigation, in time sink beneath the surface of the ground and disappear. We are unable to give, from the evidence introduced by the complainant, a definite statement as to what amount of water was actually used, much less the amount of water required in the irrigation of this area, but from beginning to end of the evidence in chief, this fact appears, that water was used just as freely as the irrigator wished and the supply permitted. It was a copious flooding, and that practically at no time in the history of the Laramie Plains had there ever been any administration of the water by the water commissioner or any other official. The few exceptions will be noted later.

However, Mr. Meeker, in his Exhibit J, followed in rebuttal by Exhibit T-8, estimates the amount of water distributed to the ditches between the No. 2 Dam and Two Rivers on the Little Laramie, at 17,245 acre feet in the year 1912. Inasmuch as there is, according to the defendants' plane table survey, 31,341 acres in this area, Mr. Meeker's figures, if correct, would mean a duty of water of approximately .55 of an acre foot per acre, which, upon its face, is absurd. The evaporation from the surface of the soil would even approach this amount. Moreover, it is absolutely inconsistent with his amount distributed to the Pioneer Canal, for the same year, which he gives as 17,703 acre feet for the year 1912, Exhibit B. The Pioneer Canal, in large measure, irrigates native hay lands, similar to the irri-

gation upon the Little Laramie, and yet Mr. Meeker was able to find by his reconnaissance only 11,556 acres under the Pioneer, and this is reduced by our plane table survey to 10,605 acres. It would therefore appear that his duty of water on the Pioneer, if his estimate of the flow of the river is correct, is approximately 1.6 acre feet per acre. His Little Laramie figures and his Pioneer figures cannot be harmonized, but that is not to be expected, because we know his estimate of the flow of the stream is entirely too low, and that 1.6 acre feet per acre is only a fraction of the amount of water actually used under the Pioneer Canal and other ditches in the Laramie Plains area, but let us take Mr. Meeker at his own figures for a moment. He testifies on rebuttal that the normal flow of the Big Laramie at Wood's Landing is 200,000 acre feet per annum, that the Little Laramie is approximately fifty per cent of this amount, measured at Filmore. In other words, he estimates the total in the two streams to be 300,000 acre feet per annum, without allowing anything whatsoever for any other sources of supply, although we know there are such. Let us for a moment consider only the 300,000 acre feet. Now let us deduct 100,000 acre feet for the excessive amount which the Wheatland people contend they have used. That leaves 200,000 acre feet net for the use of the Laramie Plains. Now, if Mr. Meeker's figures be correct, in his Exhibits J and T-8, that 17,245 acre feet of water was distributed in the normal year 1912, for the irrigation of 31,341 acres of land on the Little Laramie between the Lake Hattie No. 2 Dam and Two Rivers, thereby establishing a duty of water at .55 acre feet per acre, he has water enough, according to his own estimate of the total flow, after deducting 100,000 acre feet for Wheatland, to irrigate 363,000 acres of land. Or, on a like basis, if the duty of water as established under the Pioneer Canal by Exhibit B and others following it of 1.6 acre feet per acre is correct, he has water enough for the irrigation of 125,000 acres of land, yet all the land now under irrigation in the Laramie Plains, is, as we have shown, 78,999 acres below the points of measurement on the two streams. Assuredly Mr. Meeker is wrong either in the total amount of water available in the two streams, or in his duty of water, or, what is probable, he is wrong in both.

Other analyses of Mr. Meeker's figures show additional inconsistencies.

As heretofore mentioned, the defendant showed that the amount of water in the Big Laramie at the state line is, according to Mr. Field, approximately 250,000 acre feet per annum; according to Mr. Hedke, approximately 300,000 acre feet, and according to Prof. Carpenter, in excess of 320,000 acre feet per annum. We also showed the exact number of acres under irrigation as heretofore explained, and we showed the

lack of administration, the go-as-you-please system of the distribution of water in Wyoming, the absence of adequate diversion works, in short, primitive methods, arguing an abundant supply of water.

On rebuttal, Mr. Meeker, the Wyoming expert, took the stand again and of necessity was compelled to modify the conclusions deducible from his tables previously introduced in evidence. Let us see what he did.

In the face of his own tables showing .55 of an acre foot per acre as the duty of water on the Little Laramie and 1.6 acre feet per acre under the Pioneer Canal and various other amounts in different locations on the Laramie Plains, and in the face of the fact that all of the evidence showed wasteful conditions in the use of water, he testified (4317):

> "From my records and experience, the duty of water diverted from the Laramie River between Pioneer Dam and Two Rivers station is approximately one acre foot per acre. This includes copious flooding of the meadow lands and irrigation of the pasture land adjacent to the river. If all the lands irrigated between these stations were included, the duty of water would be higher."

Moreover, with respect to the lands on the Little Laramie River he placed the duty of water also at one acre foot per acre. This particular testimony seems to have been omitted in the abstracting, and we therefore take the liberty of quoting the original transcript, page 4320:

> "Q. I neglected to ask you if you could state approximately the duty of water realized between Lake Hattie No. 2 Dam on the Little Laramie and Two Rivers. A. That is also approximately one acre foot per acre per annum.
>
> Q. Is the general character of the irrigated crops grown there similar to that in the Big Laramie Valley? A. Yes, sir.
>
> Q. Including meadow lands and irrigated pasture? A. Yes sir, and on account of the copious application and large return waters, there is also a large re-use of water between the two points, which accounts for the high duty.
>
> Q. What can you say of the relative rapidity of the return flow in that portion of the stream? A. That is also very rapid."

From this it appears that Mr. Meeker, possibly in order to make his estimated total flow in the river coincide with the number of acres which he claimed to be irrigated, places the

duty of water at this amount, one acre foot per acre, for practically all of the irrigated area of the Laramie Plains.

Now, on this basis, Mr. Meeker finds water enough in the Little Laramie and Big Laramie, without considering smaller tributaries, for the irrigation of 300,000 acres of land after the amount at present diverted by Colorado is eliminated, or enough water for the irrigation of 244,000 acres after Colorado has diverted the additional 56,000 acre feet which we expect to take through the Greeley-Poudre tunnel. Wyoming has, according to the testimony, a total of 108,073.75 acres now under irrigation in the Laramie Plains and in the Wheatland area. Apparently the expert testifying in this regard in behalf of the State of Wyoming, and, as a matter of fact, the only witness in behalf of the State of Wyoming who attempted to testify as an expert on the question of water supply and the duty of water, finds that according to his established duty of water, he has, after Colorado will have made its additional diversion herein sought to be enjoined through the Greeley-Poudre tunnel, water for the irrigation of 135,926.25 additional acres of land above the amount now irrigated. It is true that Mr. Meeker did not testify to the duty of water on the Wheatland area, neither has any other witness except as we have heretofore reviewed it. If it be contended that the duty of water on the Wheatland area is lower, this acreage would, of course, have to be reduced accordingly.

Mr. Field, State Engineer of Colorado, found that from the total supply of water available for all lands above and including the Wheatland tract, after deducting all Colorado diversions, including the 56,000 proposed through the tunnel, that there remains for the Wyoming lands 373,500 acre feet of water as a normal yearly supply. If Mr. Meeker's duty of water be correct, then, after Colorado had done everything which physically can be done toward the diversion of water from the Laramie River, there remains, with the Wyoming supply added, enough water above the Wheatland tract to irrigate 373,500 acres, and if Prof. Carpenter be correct then there will remain water sufficient to irrigate in Wyoming 400,000 acres or more.

ADMINISTRATION OF WATER.

Fundamentally the laws of Colorado and Wyoming, with respect to irrigation, are the same. As a matter of fact, the Wyoming laws were patterned largely after the laws of Colorado, and probably the chief difference lies in this: that in Wyoming the water is appurtenant to the land; as we understand, it is adjudicated for the irrigation of a certain piece of land. In Colorado, the water is not appurtenant to the land.

In Wyoming the prospective appropriator applies to the executive officers for a permit, which is granted him if there is, in the judgment of the State Engineer, sufficient unappropriated water in the stream to supply his demand. The appropriation or the priority of appropriation dates from the time this application is filed, and later on the adjudication or decree is made by the Board of Control, consisting of the State Engineer and the Division Superintendents of the state. From this board an appeal lies to the courts.

In Colorado no permission is necessary to initiate a right, but the appropriator files his map and statement with the State Engineer, formerly with the county clerk and recorder of his county, and proceeds with his construction regardless of the amount of unappropriated water in the stream. If he proceeds with diligence, depending upon the circumstances, he is entitled to a decree, but this decree is rendered by the District Court having jurisdiction.

In both states the chief executive officer having jurisdiction of the administration of water is the State Engineer. The states are then divided into divisions, over each division there is a division engineer, or, as termed in Wyoming, division superintendent, and again divided into water districts, each water district being under a water commissioner.

In Colorado every ditch diverting from the stream is required to maintain an adequate headgate by which the water may be shut out of the ditch, and a definite measuring weir in which the water flowing in the ditch can be measured, and each reservoir is required to maintain a gauge indicating the depth of available water in storage.

Poudre Valley.

In considering the administrative methods employed in the Poudre Valley, we wish to refer generally to the testimony of John L. Armstrong, appearing at pages 2454 to 2548, inclusive, and of A. A. Edwards, a man of wide experience in irrigation matters, pages 2180-2258. Mr. Armstrong had been for twenty-four years out of thirty-one, water commissioner or acting water commissioner of Water District No. 3 of the State of Colorado, which includes the Poudre Valley, and he gives in detail the system under which his duties are performed. The inflow from other watersheds into the Poudre River is observed and measured constantly by deputies, and the flow of the stream constantly observed. Each of the larger canals maintains an employe whose duty it is to regulate the gates of the canal, and the commissioner is in constant touch with these headgate keepers by telephone. In fact, before public telephone lines became general in the Poudre Valley, private lines were built in part for this purpose. The commissioner makes it a

practice to notify each headgate keeper of the water available for each respective ditch twice a day, and oftener if there is a radical change in the stream flow. Ditches are watched with minute care in order to secure the proper distribution of water and the prevention of waste.

Counsel for the complainant refer to the methods employed by the water commissioner in this regard as being those of a fugitive from justice, because of his surreptitious visits to headgates, etc.

Methods of exchange between upper and lower ditches or ditches and reservoirs have been systematized. For illustration, an upper ditch of junior priority may have a reservoir located at some place which renders it unavailable for the irrigation of the lands under that ditch. This reservoir is filled when water is available for it. During the irrigation season this ditch may take the water from the river to which an earlier but lower ditch is entitled and from its reservoir supply a sufficient amount of water for the needs of the earlier but lower ditch. Many other illustrations of the exchange of water might be given, but it is unnecessary to say more than that by reason of this general system the highest possible use of water is accomplished and the irrigation of far more land is made possible than if such a plan were lacking.

Comment has been made that some ditches in the Poudre Valley were not thus regulated and scrutinized, but these, as described by Mr. Armstrong, are small ditches having early priorities, lying close to the river and these, or at least some of these, the witness states it is not necessary to regulate for the reason that they can use only so much regardless of the amount they divert, and that the surplus returns immediately to the stream. It must be borne in mind that these ditches under these peculiar conditions are the exception to the general rule, and when we state that the larger ditches in the Poudre Valley are many miles in length, the court will at once understand the difference and the reason for the difference. For illustration, the Poudre Valley canal as extended to irrigate the lands of the Greeley-Poudre Irrigation District is more than one hundred miles in length. The Larimer County canal, frequently referred to in the testimony, is something over eighty miles in length; the Eaton canal about the same length, and others also of great length. Practically all of the canals in the Poudre Valley have modern, efficient diversion works, those of later construction being mostly of concrete or masonry, older ones being timber construction. There are a few exceptions to this rule.

This administrative system in the Poudre Valley is not the accomplishment of one day, but it is the development of possibly forty years experience in irrigation, during which

period there were several times at which it was thought that the limit of irrigation had been reached in the Poudre Valley, but successive years have shown that the duty of water constantly increased, that the necessity for water produced more efficient methods both in distribution and in application, and that possibly the Poudre Valley has not yet attained its ultimate development in this regard.

Administrative Methods in Wyoming.

Let us contrast the Poudre Valley in this regard with the Wyoming area under consideration. The Wheatland system is relatively new, and the diversion works modern. The same thing may be said of the Lake Hattie System and the Lake James System, possibly some others. But these are the exception to the rule in Wyoming, where we find that the most primitive conditions still prevail and ditches are largely without dams, without adequate head gates and no definite system of administration has ever been employed. To definitely show this lack of development, or rather, to show these primitive conditions, the defendants caused to have taken a photograph of the head gate of every ditch diverting water from the Big and Little Laramie Rivers on the Laramie Plains area. These photographs are introduced in evidence as Exhibit 115, and speak more forcibly than any verbal description which we could make.

Let us see what the Wyoming evidence discloses as to the administration of water by the officers of the state having jurisdiction of the subject-matter.

Mr. Elliott, superintendent of the Wheatland system, testified that neither the Board of Control, the State Engineer, the Division Engineer or the Water Superintendent or any other water official had ever required them to release water held in storage in either of their reservoirs, nor had in any way interfered with either the storing or the diversion of water in that system (194).

His predecessor, Mr. Johnson, however, testified, as we have previously stated, that in 1911 they were required to allow some water to pass the diversion dam. In other words, they were not permitted to take it all.

Another witness, Mr. Mortimer N. Grant, was produced by the complainant. It seems that Mr. Grant, a civil engineer, was water commissioner on the Big and Little Laramie Rivers and their tributaries in Wyoming in the year 1913, and his testimony is so pertinent to the subject now being discussed that we feel justified in quoting at length from the abstract. This testimony appears at transcript pages 1276 to 1289:

"I am a civil engineer. In 1913 I was Water Commissioner for that district in Wyoming covering the Big and Little Laramie Rivers and their tributaries from the state line down to a point about a mile below the junction of those two rivers.

On the Big Laramie complaints about water were made that year, the latter part of May or first of June, by the Wyoming Development Company, and complaints were made about July and August by four or five ranchmen. On the Little Laramie more complaints were made, mostly down towards the mouth.

The complaints on the Little Laramie were chiefly in July and August.

I encountered quite a bit of trouble in distributing water among the users from the Little Laramie in 1913 because of the low stage of water in the Little Laramie River. It practically disappeared before it got down to its mouth. I took a vacation and ended my duties that year about Sept. 1st."

Cross-examination by Mr. Fred Farrar:

"During the period mentioned, my headquarters were at Laramie. During July and August I was in the field the major portion of the time. My trips generally consisted of the following: I went up to the head of the Little Laramie, down the Big Laramie and back up the Little Laramie. I think I made seven complete round trips, aside from side trips. That is only approximately, I don't know the exact number of trips. The Wyoming Development Company, mentioned, which made complaint, is the Wheatland Company. No complaint was made against Lake James, there was one complaint made against Lake Hattie. I don't remember the exact date, it was about June 8, I imagine. In the year 1912 I think there was a man named Wilson acting as water commissioner on the Little Laramie, I don't know who was on the Big Laramie, I understand there was a commissioner. Previous to that year there had been water commissioners appointed, but they have never been out in the field to amount to anything. The water commissioner, as a rule, only goes out in the field when called. Otherwise he does no actual work."

Cross-examination by Mr. Charles F. Tew:

"I was called on to measure water. I usually did all my work with a current meter. I was not making reports for the state engineer's office. The current meter

was employed because there were no measuring devices in the Big Laramie ditches that were adequate. The practice prior to 1913 on both the Big and Little Laramie Rivers, so far as I know, has been to employ the water flow of the stream without the assistance of any measuring devices in the ditches. The only time the water commissioner had been employed on the Big and Little Laramie Rivers to my knowledge was when there was complaint by water users. I think that was the practice all over the state. I think in 1912 the water commissioners on the Big Laramie were put on a salary and supposed to be in the field all the time.

There have been differences prior to 1912. In 1912 there was no complaint that I know of. There was a man employed as commissioner but I have forgotten his name. I never heard it mentioned. With the exception of the Pioneer dam on the Big Laramie River and the Lake Hattie Supply No. 2 dam on the Big Laramie River, the dams all up and down the river are what you would ordinarily call ranch ditch or beaver dams, consisting of brush and the like. Each freshet modifies the dams somewhat. There were no set or fixed conditions at the head of any ditch whereby former measurements would be a proper guide as to the inflow into the ditches. It would be impossible for a person on either river in the year 1913 to state, without a current meter or measuring device, what amount of water was being taken into any ditch at any time. All that could be reached without the use of instruments would be a poor approximation. From conditions I saw on the ground, I imagine that those conditions had existed and prevailed always. With the exception of the Bellamy canal diversion and the Lake Hattie No. 2 diversion on the Little Laramie, the remainder of the dams were of brush and the measuring devices lacking the same as on the Big Laramie. The Bellamy Ditch is the intake for James Lake. From what I have seen on the Big Laramie, it is as I have described. When I made these trips I generally went to the several headgates. I established rating stations and put in gauges on several of the ditches. I traveled up and down the river with a team and went up as far as Wrights and stayed there and then went around the country and crossed over to Lake Hattie and Sodergreen's. I measured pretty near all of the ditches from time to time. I put in staff gauges to see what was flowing in. On the Little Laramie River there were quite a number of complaints made in July and August. Rating stations were placed in only the biggest ditches. There

were no particular clashes that I had any trouble over. I either shut them down a little bit or opened them up accordingly. There were some cases where there were no headgates. The only place I had any trouble was on the Big Laramie, and there I sometimes shut down the gate or throw manure in it, probably old gates were in, but they would leak.

Most of the ditches on the Big Laramie River are what you might call two-story ditches; that is, they were above the bottom of the creek so they would have to have a dam to divert at low stages. At high water they got all the water they needed. They start to drawing water for these meadows in the higher states in June. The whole territory along both streams is used as a hay ranch country. The irrigation season is close onto ten weeks for hay. They generally use their water right up to the time they cut their hay, which is about the middle of July. Some may start in later than the first of May to irrigate, but they generally irrigate from the first part of May to the middle of July. There was clamor of shortage of water but they gave us no trouble; the flow could be regulated by using manure as described. The Big Laramie River got down pretty low in the latter part of July and August, with a manure and rock dam you could divert all the water.

There were a number of what I called two-story ditches. The average ditch does not cut the bottom of the river. A great many of the ditches are two-story. With a two-story ditch the irrigator obtains all the water he wants when the river is high, but at low stages it requires a dam. At such times the user goes to the head and throws some obstruction in the stream to suit his desires. The change of elevation of water of course makes a change of intake capacity in these two-story ditches. The irrigators settled their questions themselves; they probably would be disgruntled, but didn't bring complaints to my office. From the conditions I noted there on the channel of the river, it looked to me that the same conditions prevailed as they had in the past. It is also true that each high water flow modifies these dams to some extent, washes them out and they have to be re-installed. While the dams have been changed from time to time, the ditches have remained unchanged."

Cross-examination by Mr. Delph E. Carpenter.

"Lake Hattie evidently had been receiving water after the ice had passed out of the river in the spring. I cannot tell you the amount of water in Lake Hattie,

I haven't the data with me. They had diverted only from the Big Laramie River in 1913, but I did not keep a record of the flow. I read the gauge every time I was there. They ceased running water into Lake Hattie on about June 8, 1913, and I think that Lake Hattie was about half full in addition to all the dead water space in the lake. I would say that they had approximately 20,000 to 30,000 acre feet of water available for irrigation in Lake Hattie.

I did not know that they were running water out of Lake Hattie and wasting it into Big Basin until about the first of September. The only time I knew of their running water down into Alkali Lake or Alkali Basin was when they tried out the canal once or twice. It only ran for a day or so at that time. I heard that at a later time when Mr. Goldsborough had some prospective land buyers out there he ran water for several days and wasted it into Big Basin. I did not go to look it up. I think there was considerable water left in Lake Hattie when I resigned, about September 15. My active duties as water commissioner ceased September 1st, after that date I was only subject to call.

Water was diverted through a ditch known as Sodergreen's high line ditch in the summer of 1913. That is a recent ditch; a recent appropriation. The Sodergreen high line was shut off in June some time, with the exception of one or two days' run.

I cannot say how much water was diverted into Lake James during the summer of 1913. I kept no record.

I had the record of flow and gauge height of Lake Hattie from Mr. Meeker; the only gauge heights I took from time to time were those I had to take when I was there to check his.

The first complaint I received was from the Wyoming Development Company, directed against Lake Hattie enterprise. There was, I imagine, about a week I didn't get any records on the steel bridge at Lookout. I think Mr. Elliott went up and measured the water at the steel bridge and made complaint at that time. His complaint was that there was insufficient amount of water coming down to the Wheatland Reservoir to satisfy their rights. I turned the water down from the Lake Hattie diversion because Lake Hattie was what was called a flood water right to fill Lake Hattie, and Wheatland was prior to Lake Hattie. In other words, the Lake Hattie enterprise was a very recent one, more recent than the one below.

On both the Big and Little Laramie Rivers it is practically physically impossible for any water commissioner to properly apportion the waters with the appliances that exist at the present time. The Little Laramie is better as to headgates than the Big Laramie. Everything is so crude on both rivers that an apportionment according to the legal rights of the parties is practically out of the question, unless one has a current meter to measure it, and then it is a matter of a good deal of labor to try to regulate the water. Each rating consumes considerable time and expense. So that, for the orderly administration of that water supply the conditions are not there. The accuracy of the ratings depends on the percentage of errors you expect to allow. You can't get them down to any fraction of a foot or so, on any of those ditches, without cleaning out the channel, but it is almost as good as a measuring flume ordinarily. The Big Laramie is passing through the same history that all streams have passed through until a certain pressure is brought to bear on them, when they have to put in certain devices to regulate the water.

The James Lake enterprise is a comparatively recent one."

This testimony from a Wyoming witness clearly proves every contention which defendants have made to the effect that primitive methods still pertain in the Laramie Plains area; that there has been practically no distribution of water by the officers of the state, but, on the other hand, that go-as-you-please methods have and still do prevail.

Methods of administration, distribution and application of water between the Poudre Valley and the Wyoming area are further contrasted in the testimony of Mr. Field, the State Engineer of Colorado, more particularly at pages 3562 and 3576, inclusive.

Exhibit 115 is a series of photographs showing the diversion works of practically all ditches on the Laramie Plains. A key map in the front of the album shows the location of each scene.

COMPARISON OF AREAS.

The defendants approached the trial of this cause with the feeling that the court would desire the fullest knowledge of all questions pertinent to the direct issues, and to this end they have undertaken the production of much evidence tending to show the difference in the two areas—both the difference in develop-

ment and the difference in possibilities, and, in reviewing the evidence, we are going to adopt a statement made by Dr. L. H. Bailey, a witness produced by the defendants, to the effect that the two areas are to be contrasted rather than compared.

When we speak of the two areas, it is possibly best that we define our meaning. We have heretofore admitted that the Wheatland area, lying to the east of the mountains, with an elevation of approximately 4,700 feet above sea level, should be a normal agricultural district, that is, normal based upon conditions pertaining throughout the arid west, eliminating any exceptional areas.

The growing season at Wheatland should be comparable with the growing season in the Poudre Valley, and, inasmuch as during the thirty years which have elapsed since the inception of the project, various crops have been grown, we expect that the future will demonstrate that the major portion of the Wheatland tract is a fair agricultural district capable of producing hay, cereals, garden truck, and, possibly, sugar beets and potatoes, although the evidence discloses that the culture of sugar beets heretofore has been not highly successful, but we have no particular criticism to direct to this area from an agricultural standpoint, and the contrast which we wish to draw will be, therefore, limited to the Poudre Valley and the Laramie Plains. At the outset we wish to explain that the lands included within the Greeley-Poudre District are nothing more nor less than an extension of the already reclaimed lands of the Poudre Valley, differing in no material respect from the developed lands immediately adjoining on the west, and the history of the Poudre Valley under irrigation gives a very fair indication of the development to be expected in the 125,000 acres constituting the Greeley-Poudre District, if water is available for its irrigation.

The distance between the Poudre Valley and the Laramie Plains, at their nearest points of approach, is not to exceed fifty miles in an air line. However, the trend of the valleys is, generally speaking, at right angles to each other. Nevertheless, while only these few miles intervene, we find the greatest divergence in practically everything except distance. The average elevation of the Poudre Valley is between 4,500 and 5,000 feet above sea level. The city of Fort Collins, lying about six miles immediately outside the foothills, is 5,000 feet, while the city of Greeley, some 25 miles further down the Poudre River, is about 4,500 feet. Between the Poudre Valley and the Laramie Plains lies a range of mountains heretofore described as the Green Mountains in Colorado and known as the Black Hills or the Laramie Mountains in Wyoming. This is a relatively low range and the Laramie Plains, lying within or to the west of this range, constitutes but one of a number of high mountainous plateaus enclosed by the different parallel ranges constitut-

ing the Rocky Mountains. A similar area in Northern Colorado is called North Park. Passing southward through Colorado we find three more of these so-called parks or high mountain plateaus, they being, in turn, Middle Park, South Park and the San Luis Valley, and each one is comparable in many respects to the Laramie Plains, in that, as a rule, the altitude is so great as to forbid agriculture in the accepted sense of the word, but, on the other hand, native hay is rather abundantly grown and the areas have always, since their earliest settlement, been devoted to livestock raising. There is some difference due to latitude and the evidence shows the San Luis Valley, in the south central part of the State of Colorado, with an altitude of about 7,500 feet above sea level, has the advantage of lying approximately 400 miles to the south of the Laramie Plains, and on that account enjoys a somewhat warmer climate than does the Laramie Plains, but that, nevertheless, in this San Luis Valley, agriculture has largely been confined to the hardier plants, owing to the brevity of the growing season and the prevalence of late frosts in the spring and early frosts in the fall.

The Laramie Plains has an average elevation of approximately 7,100 feet above sea level, the city of Laramie, lying about the center of the valley, being 7,187 feet above the sea. This difference in altitude, that is, 7,100 for the Laramie Plains and approximately 4,700 for the Poudre Valley, is the principal reason for the agricultural contrast in the two areas.

The complainant, in its brief, with some irony, comments upon the amount of evidence devoted by the defense to the beauties of the Poudre Valley and admits that it is an area of high agricultural development, and also admits, in so far as we can expect admission on this point, that the Laramie Plains is handicapped by a cold climate and that its agriculture must be of a very limited sort. We believe that the history of these areas and their development, or lack of development, is a very clear indication of their possibilities. While it is true that, generally speaking, the areas included within Colorado and Wyoming began developing about the same time, nevetheless Wyoming had the advantage of the earlier settlements and the earlier transcontinental highways, the only possible exception being some Spanish settlement in the extreme southern portion of the State of Colorado, but the very early wagon routes across the continent passed across what is now the State of Wyoming, and Fort Laramie (distinguished from Laramie City), at the junction of the Laramie and North Platte Rivers, has been a point of settlement of marked historical interest from the earliest days in the settlement of the West. This point was established, probably as early as 1844, as a fur trading station and was later occupied as a garrison for U. S. troops. From here fur traders operated probably throughout all of the surrounding Rocky Mountain region, going as far south as the

Poudre Valley in Colorado. In the 60's the Union Pacific Railroad, building from Council Bluffs, Iowa, to Ogden, Utah, followed rather closely the old Overland Trail across the range of mountains to the east of the Laramie Plains at a point known as Sherman Hill, reaching the city of Laramie, where a military post had been maintained for some time previous, in May, 1868, building thence on westward to Ogden, where its rails were connected with the Central Pacific, which built west from Sacramento, in May, 1869. Previous to the construction of the Union Pacific road, the overland stage route had crossed this area and for a brief space of time an alternative or southern route had been followed up the South Platte River to the junction of the Poudre, thence up the Poudre to a point immediately outside of the mountains called La Porte, and thence in a northwesterly direction to the Laramie Plains. This was probably the latest of the various stage routes to be established. The first railroad facilities given to the Poudre Valley area came with the construction of the Denver-Pacific, which built from Cheyenne, where it made connection with the Union Pacific road, southward to Denver, a distance of approximately 100 miles. This road reached the City of Denver in the year 1870. It crossed the Poudre Valley at Greeley and for many years was the only railroad in northern Colorado. In 1877, however, a road was built from Cheyenne southward, crossing the Poudre Valley at Fort Collins and connecting at Longmont with a road which had been built out from Denver. This was known as the Colorado Central and is now known as the Colorado & Southern. About 1883 a road was built traversing the Poudre Valley from Greeley to Fort Collins, and at that time, both of the systems having fallen into the hands of the Union Pacific, the railroad described as the Colorado Central was abandoned from Fort Collins to Cheyenne and the rails removed. Later, however, the old system known as the Colorado Central having passed into the hands of the Colorado & Southern Railroad, this line was re-established, or, rather, a new road was constructed, from Fort Collins through Wellington in the Poudre Valley and on northward to Cheyenne, forming a connecting link in the north and south system of the Colorado & Southern Railway, giving a connection from Galveston, Texas, to Billings, Montana, where junction is made with the Great Northern and the Northern Pacific transcontinental routes.

It thus becomes apparent that the Laramie Plains area, with its early transcontinental railroad facilities, had no disadvantage in the matter of transportation in the early history of its development, and these facilities, were, if anything, earlier, and as good as, if not better than, the facilities afforded to the Poudre Valley.

Today, however, we find that in the Laramie Plains there is not a single feeder line, with the one exception of a road

known as the Laramie, Hahn's Peak & Pacific, which built westward from Laramie across the Medicine Bow Mountains and thence southward into North Park in Colorado, whereas the Poudre Valley is today almost a network of feeder railroads. One road, commonly known as the Sugar Road, is owned and operated entirely by The Great Western Sugar Company, built for the express purpose of transporting beets from the farms to the sugar factories. This road originates at Loveland, some 14 miles south of Fort Collins. From thence it runs eastward, dividing, one branch proceeding to the southward, the other branch running northward across the Poudre Valley at the town of Windsor, at which point it crosses the branch of the Colorado & Southern between Greeley and Fort Collins, thence running eastward to a junction with the Union Pacific at Eaton. It is so constructed as to serve as a feeder for both the Union Pacific and the Colorado & Southern, as well as to serve sugar factories at Eaton and at Windsor in the Poudre Valley and at Loveland and Longmont to the south of the Poudre Valley. Furthermore, a branch of the Union Pacific runs in a southeasterly direction from Fort Collins, traversing a very rich section of the Poudre Valley and thence in a southerly direction to the City of Denver. Another road, known as the Denver, Laramie & Northwestern, in a general way, parallels the Union Pacific between Denver and Greeley. Numerous spurs of the Colorado & Southern radiate from Fort Collins, one to the westward up the Poudre River, and one to the eastward to a farming district commonly known as the Black Hollow. Two spurs have been built by the Union Pacific into the Greeley-Poudre District. These leave the main line near Greeley, the longer spur being something like 25 miles in length. These two spurs were constructed in anticipation of the development of the lands within the Greeley-Poudre Irrigation District from reclamation by irrigation.

It is therefore apparent that the Poudre Valley is furnished with remarkable facilities for transportation, whereas, in this regard, with the exception of the one road mentioned, the Laramie Plains remains today with the one transcontinental road passing directly through it which it had in the year 1868.

We are not able to enter into a discussion of any theory as to whether or not railroads are the cause or the effect of industrial development, but it is obvious that the various branches or feeders constructed in the Poudre Valley are the result of a demand for railroad facilities, with the exception of the two spurs from the Union Pacific into the Greeley-Poudre District, which are in anticipation of the development which is expected in that area, consistent with the development in the portion of the valley already reclaimed. These railroads can

be nothing less than the effect of a wonderful agricultural production.

The earliest irrigating ditch on the Laramie Plains seems to have been commenced in 1868, the second one in 1875, the third and fourth in 1877, and the fifth in 1878. These, as is natural, were all very small ditches. Then in 1879 the Pioneer Canal was constructed, at first a comparatively small ditch, but later enlarged to a ditch of considerable size with a length of something like 40 miles. In the Poudre Valley the oldest ditches are somewhat earlier, the first one dating in 1860, followed by a number of small ditches, until the establishment of the Greeley Colony, commonly known as the Union Colony, when two ditches of considerable size were built, one on the south of the river known as Union Colony Canal No. 3 was built in 1870, and was about 15 miles in length, and a larger one known as Union Colony Canal No. 2 was built on the north side of the river in 1871 and was originally about 35 miles in length.

We will not attempt to give the complete history of the construction of the various canals in the Poudre Valley, but two, heretofore referred to, are of particular interest in any comparison with the Laramie Plains. These are: the canal of the Larimer & Weld Irrigation Company, commonly known as the Eaton Ditch, which was commenced in the year 1879, the same date as the Pioneer Canal in Wyoming. This ditch heads on the north side of the Poudre River a few miles above the City of Fort Collins and traverses the Poudre Valley, crossing the Union Pacific Railroad near the City of Eaton and extending, by laterals, to the boundaries of the Greeley-Poudre District. The other one, the canal of The Water Supply & Storage Company, known as the Larimer County Canal, was commenced in the year 1881, heads upon the north side of the Poudre River some 12 miles above the City of Fort Collins and also traverses the length of the Poudre Valley, its extensions running slightly into the area of the Greeley-Poudre Irrigation District. These two canals are of particular interest because of the comparative date of their construction with the Pioneer Canal in Wyoming, and further, because, as we have explained, they are of about an average in age and show the remarkable development in irrigation and agriculture under irrigation in the Poudre Valley.

We have felt that where it was practical photographs showing the development or lack of development of these areas would be, to a reasonable degree, suitable evidence. Accordingly, we have introduced in evidence two large albums containing photographs showing the agricultural development under these two canals.

Exhibit 119 is a series of photographs taken along the general course of the Larimer County Canal. The first photograph

was taken at a point about two and one-half miles north of Fort Collins, from which point photographs were taken in an effort to show each quarter section subdivision along a highway running through the territory irrigated by this canal.

The other, Exhibit 120, is a similar set of photographs taken under the Eaton Ditch, commencing at the sugar factory immediately adjoining the City of Fort Collins and running in the same way.

Photographs were taken upon each quarter section along a highway traversing the area irrigated by this canal. This line passes through the City of Eaton some 18 miles to the east and on into the newly developed area adjoining the Greeley-Poudre District immediately to the east of Eaton. In each of these exhibits a key map will be found. For this purpose the map prepared by the United States Geological Survey was used and the location of each photograph in the album is indicated by number. The photographs correspond in number and each has a legend showing the date upon which the photograph was taken, the location and a very brief description of the scene.

We most earnestly request the consideration of the court to these photographs as being the best visual evidence which we could produce to show the conditions of development in these areas. No attempt whatever has been made to show the good and eliminate the bad. The pictures have been taken indiscriminately along the courses mentioned.

We endeavored to treat the Laramie Plains in the same way, but conditions are so radically different that we found it impossible to do this, so, instead, we had the engineers in charge of the plane table survey take a photograph of every set of farm or ranch improvements on the Laramie Plains within the area covered by the plane table survey. The only exceptions are the few instances in which, for some reason, the photograph was a failure. These are contained in an album introduced as Exhibit 116 which has a key map and number similar to that described for exhibits 119 and 120. We have but one apology to offer and that is that it was within our means to have the pictures shown in Exhibits 119 and 120 taken by a professional photographer, whereas we found this to be beyond our means in dealing with the Wyoming situation, and the photographs were taken by two of the engineers in the plane table party, so while they are not as large nor as good from an artistic sense as the Colorado pictures, nevertheless they give a fair representation, so far as pictures can show it, of the lack of development in the Laramie Plains area.

To supplement these smaller views, we had a number of large panoramic photographs taken, Exhibit 122. If there be any criticism as to the difference in photographic skill displayed in the former pictures, it is absent here, for the reason that these

panoramas were taken by the same photographer and upon successive days. In this album, the first picture is a scene taken on the Wheatland tract. The panorama covers a complete circle, and a better understanding can be had if the picture is bent into a circle with the observer in the center. A description is given immediately preceding the picture, so that it will not be necessary to describe these scenes in this brief.

The second picture is also taken in the Wheatland district.

The third and fourth were taken on the Laramie Plains and show with true accuracy the typical conditions prevailing there.

The fifth is taken on the Little Laramie River and shows how this area is devoted largely to the culture of native hay.

The sixth is a picture taken near Ault, some twelve miles north of Greeley. The area shown has but recently been brought under irrigation. It practically adjoins the Greeley-Poudre district lands. It clearly shows what development can be expected in the Poudre Valley under irrigation, even in a short length of time.

Numbers seven and eight are pictures taken at or adjoining the town of Ault.

Number nine is a picture taken near the town of Pierce, which lies within the boundaries of the Greeley-Poudre District, the cultivated lands shown are, however, irrigated by a recent extension of the Larimer County Canal, known as the Pierce Lateral, and had been irrigated for only about four years.

Number ten is a picture taken from the top of the sugar factory at Eaton and shows the surrounding farming country irrigated largely by the Eaton Canal, of which the original date of construction was the same as the Pioneer Canal in Wyoming.

Notice the contrast between this area and the Laramie Plains along the Pioneer Canal, shown in pictures three and four.

Number eleven is a scene taken nine miles east of the City of Fort Collins.

Numbers twelve, thirteen and fourteen are scenes at or near the village of Lucerne, about midway between Greeley and Eaton.

These panoramic photographs were taken August 5th to 8th, 1913, and a description of the various scenes will be found at transcript pages 3047 to 3070, inclusive. An attempt was made to get typical pictures of the various areas affected by this cause.

To show further the contrast in development, we went to the census reports and had analysis made of the various census reports for the decades 1870 to 1910, inclusive. This analysis was made by E. B. House, Professor of Civil and Irrigation Engineering at the State Agricultural College of Colorado.

He also testified to things other than that contained in these census reports, but from the census reports he made a series of diagrams comparing generally the counties of Larimer and Weld in Colorado with Albany and Laramie in Wyoming. These census reports are of relative value only. The County of Weld has been divided since the earlier reports were published and re-divisions have been made several times. In 1909 Larimer County, Colorado, was divided and that portion known as North Park, a country somewhat similar to the Laramie Plains area, was taken off. This is not shown by the census reports, except upon analysis of the area of the county. Moreover, the County of Laramie, Wyoming, has been divided and two new counties Goshen and Platte, created out of the northern half. The Wheatland District, which is involved in this controversy, is located in the new County of Platte. This division was made after the data was compiled for the census report, consequently everything contained in Professor House's analysis referring to Laramie County, Wyoming, is inclusive of the present area of Laramie County, Platte County and Goshen County. We do not know whether there has been any similar division of Albany County, Wyoming, or not, but we wish to make this point clear, that in the comparison made by Professor House we are including the area of the present counties of Platte and Goshen as part of Laramie County, Wyoming. This fact makes the comparison more favorable to Wyoming than would be true if the limits of the present counties alone be considered. The comparison, of course, should be made between the two Colorado counties and Albany County, which includes the Laramie Plains, and Platte County, which includes the Wheatland area in Wyoming, but inasmuch as the census report did not have Platte County, it had to be included within the area of the greater boundary, that is, the undivided Laramie County.

Exhibit 86 is a blue print drawn to scale showing the areas of the four counties.

Exhibit 87 is a diagram drawn to scale, showing the development according to population, comparing the combined Colorado counties with the combined Wyoming counties. In 1870 the total population of the Colorado counties was 2,474 as against 4,978 in the two Wyoming counties. The increase in population for the various decades is shown, and in 1910 it appears that the Wyoming counties (undivided) had a total of 37,701, whereas the Colorado counties, after the deductions had been made by the divisions of Weld County, was 64,447, or, if the original Weld County is considered, then the total would have been 88,499. This chart clearly shows the great increase in Weld and Larimer Counties as compared to that of Albany and Laramie Counties in Wyoming.

Exhibit 88 is a like comparison of population, except that Weld County alone is compared with Albany County, Wyoming, and it is remarkable that in the decade from 1900 to 1910, Weld County increased from 16,808 to 39,177, while Albany County, Wyoming, decreased from 13,084 in 1900 to 11,574 in 1910.

Exhibit 89 is a chart showing the comparison in rural population. In 1870 the two Colorado counties had 1,994 persons in their rural population, whereas the Wyoming counties had 2,700; in 1910 the Wyoming counties (undivided) had 18,144, while the Colorado counties (Weld County divided) had 43,649.

Exhibit 90 is a chart showing the development in the number of acres in improved farm lands. Each one of the four counties is shown separately. In 1870 Weld County had 9,715 acres of improved farm land; Larimer County, Colorado, 5,135 acres; Albany County, Wyoming, 184 acres; Laramie County, Wyoming, 125 acres. In 1910 Weld County (divided) had 410,346 acres; Larimer County, 252,262 acres, or, with North Park separated in 1909, 177,525 acres. On the other hand, Albany County, Wyoming, had decreased from 144,075 acres in 1900 to 107,315 in 1910, but Laramie County, probably due largely to the development at Wheatland, Wyoming, had increased from 93,304 in 1900 to 210,992 in 1910.

Exhibit 91 is a chart showing development in the number of farms, each county being shown separately.

Exhibit 92 shows value of improved farms.

Exhibit 93, the number of acres irrigated.

Exhibit 94, the value of farm crops.

Exhibit 95, bushels of wheat produced.

Exhibit 96, average yield of wheat per acre.

Exhibit 97, oats produced.

Exhibit 98, average yield of oats per acre.

Exhibit 99, barley produced.

Exhibit 100, average yield of barley per acre.

Exhibit 101, potatoes produced.

Exhibit 102, average yield of potatoes per acre.

Exhibits 95 to 102, inclusive, deal with ordinary farm crops. We find from them that in 1910 Albany County, Wyoming, produced only 4,068 bushels of wheat; Laramie County, 107,800 bushels; Larimer County, Colorado, 580,250 bushels, and Weld County, Colorado, 1,628,022 bushels, and even then a decrease in the wheat production in the Colorado counties is apparent with the advent of the sugar beet industry.

Likewise we find that in 1910 Albany County, Wyoming, produced 120,449 bushels of oats, Laramie County, Wyoming, 632,949; Larimer County, Colorado, 514,553, and Weld County, 856,544.

The 1910 barley production seems to be as follows: Albany County, Wyoming, 10,361; Laramie County, Wyoming, 21,946; Larimer County, Colorado, 179,847; Weld County, Colorado, 577,637.

Potatoes in 1910: Weld County, Colorado, 5,867,691 bushels; Larimer County, Colorado, 198,506 bushels; Laramie County, Wyoming, 203,016; Albany County, Wyoming, 43,729.

As we stated, these figures are relative only. Doubtless there are at times inaccuracies in statistics obtained for the Census Bureau, and we do not insist that they represent exactly the correct data in any one county, but the system was undoubtedly uniform, and the errors, if any exist, should be compensating.

Moreover, it must be borne in mind that these figures are for the four counties, taking each county as a whole, and, of course, in this case, we are comparing not counties but only portions of counties. Nevertheless, they clearly show the relative value of the areas here in controversy as agricultural districts.

Exhibit 103 in like manner shows the hay production, in 1910 Albany County, Wyoming, producing 52,748; Laramie County, Wyoming, 116,700; Larimer County, Colorado, with North Park, a hay district, taken off, 109,792, and Weld County (divided) 168,214 tons. This classification of hay includes not only native grasses but alfalfa.

Exhibit 104 shows live-stock, and here the contention of the defense that the Laramie Plains, which is in Albany County, Wyoming, is essentially a live-stock area, becomes apparent. In 1910 the total number of live-stock in Larimer County, Colorado, was 49,753; Weld County, Colorado, 84,850; Albany County, Wyoming, 199,103, and Laramie County, Wyoming, 552,153. Laramie County, Wyoming, is a heavy producer of sheep. We understand that these figures do not include sheep and cattle held temporarily for fattening. The Poudre Valley imports several hundred thousand head of sheep and cattle each year. These are fed for the market, usually during the winter months.

These exhibits, 86 to 104, inclusive, are prepared from data contained in the United States Census Reports.

An analysis was also made by Professor House of the Government meteorological reports for the stations at Laramie, Wyoming, and Greeley, Colorado. The station at Laramie is connected with the Experiment Station at that point.

Exhibit 105 is two plots showing the minimum monthly temperatures throughout each year for the decade 1893-1902, inclusive, and the decade 1903-1912, inclusive. Minimum monthly temperatures are selected instead of maximum temperatures in order to show the relative length of the season above

frost at each station. The solid irregular lines on the plots indicate the minimum monthly temperatures at Greeley; the dotted line at Laramie. The chart is graded to show temperatures from 30 degrees below zero to 60 degrees above zero, Farenheit. At a point on the plots representing 32 degrees above zero, a heavy line runs transversely across the sheet and the temperature lines above this heavy line therefore indicate the portions of the year during which no temperature as low as 32 degrees, or freezing, occurs.

The number of days in the season above frost at the two stations for each year from 1892 to 1912, inclusive, is shown on the plots and also in the abstract (2424-2428). The average for the twenty year period is 126.5 days at Greeley and 57.6 days at Laramie.

The records from which this data was taken are beyond dispute. The same methods of taking and recording temperature were pursued at the two stations, and it is conclusive testimony to the fact that for a period of twenty years the average season between frosts at Greeley was approximately two and one-half times as long as at Laramie. It must be borne in mind that the temperature lines plotted on Exhibit 105 show only the minimum monthly temperature. The exhibit in no wise is intended to indicate daily temperatures.

As an illustration of one of the extremes, it is to be noticed that in the year 1904 there were 128 days at Greeley when the temperature was above freezing, whereas it frosted every month in the year 1904 at Laramie City, Wyoming.

Within the scope of this brief it is impossible to review in detail all of the evidence showing the development and the present status of the Poudre Valley. Much evidence was introduced for this purpose, but so diversified are the interests of this valley that it was impossible to show the conditions prevailing there without the production of a number of witnesses. Suffice it to say that we have traced the history of the valley from its pioneer days when the earliest crops consisted of the production of a small amount of native hay along the river bottoms, with a very small amount of garden truck, through the expansion of the irrigated area, and the production of small grains, to the present day development, the evidence showing that probably the Poudre Valley is as advanced a region for diversified farming as can be found in the whole country. We have shown that the production of grains has relatively decreased with the introduction of other crops, notably potatoes and sugar beets, and that development has progressed until a more thoroughly modernized farming area would be hard to find. In the valley there are two small cities, modern in every respect, Fort Collins at the upper end and Greeley at the lower end of the valley, each of these having a population, according

to the 1910 census, in excess of 8,000 people; each with a large educational institution, the State Agricultural College and the Colorado Experiment Station being at Fort Collins, and the Colorado Teachers' College, commonly known as the Normal School, at Greeley. In addition to these, there are numerous other towns varying in size, the largest of which is the town of Eaton, some eight miles north of Greeley, and Windsor, midway between Fort Collins and Greeley; also towns such as Ault, Pierce, Wellington, Severance, Timnath, LaPorte, and many others which we need not give in detail; that even in the Greeley-Poudre district several small towns, more particularly Hungerford, Camfield and Briggsdale, were built in anticipation of the development of that tract.

We have shown the substantial nature of the improvements and the presence of modern conveniences, such as telephone and electricity for power and light, not only in the towns and cities, but also throughout the rural communities.

We have shown that to the west of Fort Collins, in the area which is known as the LaPorte district, intensified farming has become the rule, and that the area is devoted to a large extent to the production of fruit, such as berries, cherries and apples, and the production of garden truck, and that in this district the farms are frequently 10 and 20 acre tracts, producing, in some instances, several hundred dollars per acre per annum; that probably this sort of production was encouraged in the LaPorte district rather than other portions of the valley for the reason that this was the point at which one of the overland stage routes beforementioned left the Poudre Valley for the Laramie Plains and the settlers at LaPorte, at an early date, found a ready market for garden produce in Wyoming, particularly in the Laramie Plains area, and that this market is still availed of and great quantities of fruit and vegetables are hauled by wagons into the Laramie Plains area, as well as shipped by rail.

We have shown that there are numerous flouring mills throughout the valley, particularly at Fort Collins, where there are two, Windsor, Greeley and at Eaton, with elevators at other locations, and that the product of these mills is, to a very large extent, exported to various portions of the United States. It is significant, however, that one miller, Mr. B. F. Hottel, who testified for the defense, stated that he always had had a large market for his flour at Laramie, Wyoming (3300).

We have shown that at Greeley there is a large canning plant, at which vegetables grown in the surrounding country are canned; that cabbage, onions, celery and other garden products are raised extensively for exportation surrounding Greeley.

To the northward of Greeley, in the territory surrounding Eaton and Ault, vast crops of potatoes have been and are grown. These are known as the "Greeley potatoes," and their

fame has extended throughout the whole United States, exports being made even to Cuba, the average amount exported being 4,500,000 bushels per annum (3095-3109, 3198-3212).

We have also shown that with the year 1901 there began the development of the sugar beet industry, with the result that there are beet sugar factories located at four different places in the Poudre Valley; Fort Collins, Windsor, Greeley and Eaton; that these factories are of enormous size, modern in every way, but it would hardly be fair to permit the inference to go that these four factories in the Poudre Valley constitute all in northern Colorado. Within a radius of probably fifty miles from Greeley there are in all nine sugar factories, all belonging to one company, the Great Western Sugar Company. This is the largest sugar producing area in the State of Colorado, and it is a matter of public knowledge that Colorado leads all other states in the production of beet sugar.

With the advent of the sugar beet, modernized methods of cultivation became necessary, and throughout the Poudre Valley where diversified farming is practiced, we learn that a scientific system of rotation of crops has been adopted with alfalfa as the basic crop. Briefly stated, the system is this: ground devoted to the production of alfalfa, which is a perennial growth, yielding in the Poudre Valley about three crops a year, with an average production per annum of about four tons to the acre, is, in the course of time, plowed up and devoted to the production of beets or potatoes for possibly two years and then to the production of grain for possibly two or three years. Possibly the last crop of grain is sowed with alfalfa seed and the farmer, after cutting his grain, finds his land in a new crop of alfalfa which will yield substantially the following season. After the land has been devoted to alfalfa for a few years, the rotation is again made. In this way the nitrogen-bearing alfalfa fertilizes the soil for the other crops.

The production of sugar beets is so great as to be astounding. See Exhibit 146, page 3580. The factory at Fort Collins is capable of working up into sugar 2,200 tons of beets per day. The cultivation of beets requires a relatively large amount of hand labor, and, for this purpose, there have been brought into the Poudre Valley many persons. The matter is of interest in this, that the crop is one which furnishes a means of livelihood for more persons than practically any other ordinary farm crop. The farmer, after removing the beets from the ground, cuts off the tops and delivers the beets to the nearest railway station, where they are loaded over a contrivance known as a dump, receiving for them a price determined by the sugar content of the beets, the average price for beets, however, being about $6.00 per ton (2346) and the average yield approximating 13 tons per acre (2349). The tops which he has removed are used for feeding either cattle or sheep, and instances of

the sale of beet tops are shown in the record where as high as $3, $4 and even $7 per acre was procured by the farmer. After the sugar has been extracted from the beets at the factory, there remains a by-product ordinarily called pulp, which is run out from the factory into immense silos and from there it is sold for the feeding of cattle and a large number of cattle are finished for market in the Poudre Valley on beet pulp, with other feeds, largely alfalfa. Another by-product in the manufacture of beet sugar is a thick molasses from which a small amount of saccharine matter cannot profitably be extracted. This also is used for the finishing of cattle for market.

Moreover, the production of enormous quantities of alfalfa led, years ago, to the development of another industry which has become of vast importance to the valley, that is, the feeding of lambs for the market, and it is a matter of common knowledge that the "Fort Collins lamb," so called, is famous in the large packing centers of the United States. These lambs are not grown in the Poudre Valley. As a matter of fact, few of them come from Colorado, but southern Wyoming and northern New Mexico are the principal sources of supply. The spring lambs are purchased, for illustration, in southern Wyoming by Poudre Valley farmers in the fall, shipped into the valley, fed on alfalfa and corn for usually a period of from three to five or six months, and then shipped to the packing centers, such as Omaha, Kansas City or Chicago. The corn fed to these lambs is imported, for the reason that corn is not a successful crop in this area.

We have already mentioned that cattle are fed, but to leave the impression that the beet pulp alone was used for this purpose would be erroneous. Cattle, like the sheep, are not raised in the Poudre Valley, but are imported from live stock producing centers, and with the modification of the feed, the methods are largely the same as those followed for sheep. In this way the Poudre Valley farmer found an advantageous market for his alfalfa and also for those things which may be termed by-products from sugar beets, that is, beet tops, beet pulp and the refuse molasses. The average market price of alfalfa is usually about $6 per ton in the stack. It would be far less, however, if the feeding industry had not developed the market.

Counsel for the complainant seem to complain at the length to which we have gone in showing the development of the Poudre Valley, but we have a pardonable pride in this development and we believe that we are justified in showing these conditions, because the fact is apparent that the Poudre Valley, acre for acre, will furnish a means of livelihood for many times the number of people that can be supported by the Laramie Plains area, even under the best methods which can be brought into practice there.

The complainant contends that they can raise practically anything in the Laramie Plains. We deny this, and it is conclusively shown that from an agricultural standpoint, as the term is ordinarily used, the country is limited to the production of hay and possibly a very slight production of the hardier grains. Where we get three crops of alfalfa per year in the Poudre Valley, the Laramie Plains gets two, and its vast area now devoted to the production of native hay, which we think is the only practical crop to be relied upon, produces an average of one half of one ton per acre, and, according to the Wyoming testimony, is worth $8 per ton in the stack. In other words, we find that the only sure crop which the Laramie Plains so far has produced is native hay, yielding an income at the rate of $4 per acre. If the Laramie Plains can produce wheat, why has it not done so? They have had a flouring mill at Laramie for many years. During a larger portion of the time, according to Wyoming testimony, it has been idle. When it does run, it has run largely upon imported wheat. One witness for the complainant testifies that during 27 years, a large portion of the grain consumed in the Wyoming area has been imported (4063). Experiments in feeding live-stock, carried on at the Wyoming Experiment Station at Laramie, required the importation of alfalfa because it could not be obtained locally (4028). They have not produced sufficient garden truck to supply the local needs, and as a matter of fact, the evidence of witness after witness produced by the State of Wyoming showed that the only garden truck the ranchmen attempted was to supply their own individual needs. They contend that they can raise oats. Why have they not done so? The fact remains that the production is lacking.

Certain persons interested in the subject, induced the representatives of the Great Western Sugar Company to send representatives to investigate the possibilities of raising sugar beets. Representatives of this company, as shown by the evidence, visited the Laramie Plains and discouraged the idea that sugar beets could be produced there. However, after looking over the situation and upon the urgent demands of various persons, a quantity of sugar beet seed was sent to persons living near the junction of the Big and Little Laramies, with directions for the cultivation of the crop upon the agreement that the beets when grown would be received at one of the factories in the Poudre Valley at a fixed price per ton. Nothing was ever heard from the venture (see testimony of Hiram Timothy, 2354-2355, and Silas H. Turner, 3133).

We have heretofore discussed, under the subject of the amount of land irrigated, three exhibits, to which we wish to refer again. The first of these is Complainant's Exhibit E, the same being a tabulation of Mr. Meeker's reconnaissance of the

lands under irrigation on the Little Laramie, the total amount of which we have criticised because of the inclusion of the Centennial Valley lands. However, for the purpose of a discussion of the areas devoted to various crops, it may be considered as it stands. In this table, Mr. Meeker classifies the lands into meadow, pasturage, oats and alfalfa. Considerable evidence had been introduced by various witnesses as to the oats which had been produced in the Little Laramie region, particularly upon what is probably the best ranch in that region, known as the Blackburn ranch, the area of which is included in the total given on this Exhibit E.

In this table, Mr. Meeker has a grand total of 49,553 acres, and of this, he classifies 26,842 acres as being meadow land, 20,077 acres as pasture, 2,314 acres as oats, and 300 acres as alfalfa land. This meadow land is native hay; the pasture land is probably land which is irrigated but which does not produce a sufficient amount of grass to justify cutting as hay and is therefore used as a pasture. Our brother Corthell for the complainant in the examination of witnesses, frequently refers to it as irrigated pasturage.

It therefore appears that out of this total amount of acreage, Mr. Meeker was able to find as devoted to agricultural crops in the accepted sense of the word, only 2,314 acres upon which oats were grown, and 300 acres devoted to alfalfa.

Keeping in mind the difference in the number of acres shown by Mr. Meeker's reconnaissance and the survey made by the defendants of this area, let us consider Exhibit 117, which is a similar tabulation, somewhat more in detail, based upon that survey of the Little Laramie area. This survey disclosed, as we have heretofore shown, 31,341 acres in this area, of which 22,081 acres was meadow land, producing native hay; 5,801 irrigated pasturage, 219 acres alfalfa, 1,319 acres oats, 933 acres plowed ground, upon which no crops were grown in the year 1913, but which had been plowed either that year or some preceding year. In addition, the survey disclosed 88 acres devoted to various other crops, including a total of 10 acres of potatoes, 43 acres of wheat or other grain except oats, 19 acres of flax, 14 acres of barley and 2 acres of turnips.

A similar tabulation to Exhibit 117 was made of the lands on the Big Laramie River, covered by the survey, Exhibit 118, except that in Exhibit 118 the lands are given under the respective ditches, whereas the individual ditches are not considered in Exhibit 117.

Exhibit 118 discloses a total of 29,279.3 acres of which 24,588.7 is meadow land, classified as first, second and third class meadow, but inasmuch as after the plane table survey had progressed, we adopted the Wyoming nomenclature for what we were theretofore terming third class meadow and call-

it irrigated pasture, which in fact it is, this total of meadow lands should really be 17,651.9 acres of meadow lands and 6,936.8 acres irrigated pasture. The survey showed a total of 1,440 acres of alfalfa, 831.6 acres of oats, 211.9 acres of other grain, 27.4 acres of potatoes, 17.6 acres devoted to gardens and 2,162.1 acres plowed ground upon which no crops were grown in the year 1913. It will be recalled that Exhibits 117 and 118 are based upon absolute survey of these lands. The two combined may be tabulated as follows:

Meadow	39,732.9
Pasture	12,737.8
Alfalfa	1,659.0
Oats	2,150.6
Other grain	268.9
Potatoes	37.4
Garden	19.6
Flax	19.0
Plowed ground	3,095.1

Attempts were made to secure, by actual measurement, the production of native hay and alfalfa per acre. The witnesses for the complainant had frequently referred to alfalfa on what is known as the Hart ranch. Accordingly, the engineers in charge of the plane table survey made measurements for the purpose of ascertaining the number of tons per acre which this farm produced. In the year 1913, the first cutting of alfalfa on the Laramie Plains commenced July 7th (2631) and the second cutting about September 18th (2752). In the Poudre Valley the first cutting usually commences in the fore part of June, the second cutting about the middle of July, and the third in September, the second cutting coming at approximately the same date in July as the first cutting on the Laramie Plains. The first cutting on the Hart Ranch, a short distance above Laramie City, produced 320 tons from 481 acres; the second cutting 252½ tons, or a total for the two cuttings of 572½ tons, an average of 1.2 tons per acre (2633). The witnesses were, of course, not able to state that alfalfa might not have been hauled from the field and not stacked, and so admitted. The amount was determined by measuring the stacks, but if any hay was hauled away, the fact was not shown by the complainant on rebuttal. This tract of alfalfa land on the Hart ranch is supposed to be the best, or one of the best, on the Laramie Plains.

Other measurements were made of the first cutting alone at other places. For illustration, the first cutting on the Hoge ranch yielded 1.1 tons per acre (2634), and the first cutting on the Buntin ranch yielded approximately one ton per acre (2635).

The native hay grown upon the Bath ranch on the Little Laramie River was likewise measured. There is, of course, only one crop of native hay per year. The Bath ranch was described by witnesses for the complainant as being one of the best meadows on the Laramie Plains. The yield from 423 acres was, by actual measurement, 253.2 tons, or approximately six-tenths of a ton per acre (2635). (We note that in the abstract the decimal point has been omitted, so that it erroneously reads 6 tons per acre.)

Similarly, efforts were made to ascertain the yield of grain per acre. Oats on the Blackburn ranch on the Little Laramie River (the show ranch of the Laramie Plains) yielded 24 bushels per acre; wheat, 11 bushels, and 19 acres of flax, 8 bushels per acre. Crops on this ranch are above the average in the Laramie Plains area. Another field of 63 acres of oats on this same ranch yielded 12.6 bushels per acre (2757).

The defendants felt that the testimony of some impartial expert on the merits as agricultural districts of the Laramie Plains and the Poudre Valley was advisable. Accordingly we procured the services of Dr. L. H. Bailey of Ithaca, New York, one of the highest authorities on agriculture in the United States. Dr. Bailey was, for many years, director of the agricultural experiment station at Cornell, and is probably best known as chairman of the Country Life Commission, appointed by President Roosevelt in 1909. His testimony is found in the abstract at transcript pages 2575 to 2615, inclusive. He testifies that he had once made a very brief visit to Laramie, Wyoming, but had never been in the Poudre Valley in Colorado prior to the year 1913; that on September 16th, 17th, 18th and 19th, he made a trip of inspection over the Poudre Valley, including the Greeley-Poudre Irrigation District, and over the Laramie Plains. This trip was made in an automobile under these conditions, that he should reach his own conclusions, free from any suggestion or argument from any person representing the defendants, directly or indirectly, but every facility was given in order to enable the witness to see everything necessary.

At Laramie, Dr. Bailey met some of the persons connected with the Agricultural College and Experiment Station, and on his reconnaissance saw what was said to be the best, from an agricultural standpoint, on the Laramie Plains.

After this trip of inspection, Dr. Bailey testifies that he made an investigation of various reports, such as census reports, soil surveys, meteorological reports, bulletins and other printed matter. Some three months after his visit, he made a report to the State of Colorado which resulted in his being called as a witness by the defendants.

He says that the two areas are not to be compared, but contrasted (2584); that he was greatly impressed with the

development of the Poudre Valley; in the industry he saw everywhere, the great number of people, the teams met on the roads hauling produce, the well-developed road systems, the character and number of the dwellings, from four to seven and sometimes more per section, established homes with good yards, small orchards, vegetable gardens; the shade trees along the highways; the frequent school houses and the thriving towns and villages; the excellent character of the soil and the crops such as alfalfa, sugar beets, potatoes, garden stuff, with storage cellars and sugar factories. "Altogether it seemed that in that region there was a highly developed rural section, founded directly on agriculture."

He then went directly into the Laramie Plains "and found a very different state of conditions." The country was more open, with a relatively small number of houses and few teams on the roads, which were excellent but with not so many of them laid out along the rectangular section lines. There were fewer shade trees, with the natural vegetation less vigorous; no rural towns outside of Laramie founded on agriculture. Saw some very attractive places, although these were not so numerous as in the Poudre Valley. Impressed with the gravel in the soil, saw some good crops of certain things, but not nearly so many as in the Poudre Valley and growing only in places here and there; very little garden truck and no fruit trees, with one exception, those at the Lund place at the head of the valley. The witness says that he saw a good number of special crops on trial, largely at the Experiment Station, which he did not enter because the frost had killed a good part of the experimental work for the year.

The witness testifies further that he had a definite impression that so far as new crops were concerned, practically everything was on trial on the Laramie Plains and that high development would be limited to special places where there is some peculiarity in soil and particularly where there is protection from climate. He says:

> "The Laramie Plains struck me as being primarily a region of live stock adaptability and in general the Greeley District is already a highly developed cropping region.
>
> It struck me that the Greeley District, acre for acre, is capable of maintaining a more intensive and more diversified cropping business, yielding as a whole more crop products and sustaining a denser population from agricultural products of the land. All these conclusions appealed to me as being self-evident.
>
> I arrived at these conclusions from my general observation of the two regions. Of course, when I came

to analyze the observations, I found that they rest on two general classes of facts, so far as I have been able to analyze them.

In the first place, the fact of actual relative lack of development of the Wyoming district as compared with the Colorado district, and second, the very considerable natural differences in elevation, configuration, latitude, soils and climate."

"If one goes into a new or developing country as a stranger, he thinks he is able to judge very well of it by observing what has already taken place in older or developed parts near-by. It is approximately the only method one has to apply. Although these two regions were open to settlement at approximately the same time, there is a very marked difference in the state of development of them."

Dr. Bailey then refers to the established reputation of the Poudre Valley area for its potatoes, sugar beets, canning crops and other products, stating that it is no longer a doubtful or experimental region, that its agricultural success seems to be assured, and that the lands within the new area, that is, the Greeley-Poudre District, have apparently as good natural adaptabilities as the adjacent lands in the vicinity of Eaton.

On the other hand, he testifies the Laramie Plains to be sparsely settled, comparatively low values, relatively little land under the plow, although there are some apparently profitable ranches.

In the Poudre Valley, the farms are small, indicating relatively intensive cultivation. In the Laramie Plains they are large, indicating less production per acre.

Dr. Bailey then reviews at considerable length various official reports and bulletins showing the character of the development in the two areas which were cited "not for the purpose of giving statistics, but in confirmation of the judgment at which I had arrived independently."

The witness then states:

"The Laramie Plains had the advantage of a transcontinental railroad. Both regions have had the possibility of developing a good water supply for irrigation. As far as I am able to judge, the Colorado region under discussion has developed continuously, or nearly so, with practically all of its irrigable lands under good or even high state of cultivation. The Laramie region has developed here and there in large ranches with some smaller establishments with very much other space that is merely

fenced and used for grazing. Of course, it is evident upon the face of it that settlers have desired the Greeley region more than the Laramie region. Of course, I am stating this not in any discouragement to development of the Laramie Plains, that must be understood, but as an assertion as to how the two areas struck me, and also as indicating that the two regions are of different character. I think this fact must be recognized when Plains Region is fully developed. It seems to me that that region will undoubtedly further develop approximately as a grazing, and to some extent as a feeding, region with such accompanying forage as can be grown with profit, and for the most part, this probably will mean its development in relatively large areas. Taking that country as a whole, as I saw it, it struck me as a region of relatively low crop production, both in totals and per acre, and also a fluctuating production, not overlooking the fact, however, of exceptions in particular places."

Witness then reviews the census figures, commenting upon the difference in rural populations, stating that:

"What has been done indicates in a general way what may be expected."

He reviews the capabilities of the two areas in crop productions, showing the comprehensive nature of the adaptability of the Colorado area for crops and the limited character of the Wyoming area. He reviews the Government soil survey reports, the soil indicating that the agricultural development of the Poudre Valley, as surveyed, far surpasses that of the Laramie region. He reviews the climatic conditions, stating that the Laramie Plains is one of the most elevated agricultural regions in North America and is therefore one of the most interesting. He states that elevation can be projected into latitude and that if this be done, the Laramie Plains area might be equivalent, other things being equal, to a point in general latitude of Edmonton, Alberta, except that the Laramie Plains lacks the greater length of day which prevails in the northern latitude.

The witness then reviews the meteorological records, taking into consideration temperature and rainfall, comparing the records at Fort Collins with those at Laramie, whereas the previous witness, Professor House, compared the Greeley records with those at Laramie. He states:

"So far as meteorological records are valuable for determining the fitness of these regions for agriculture, one would have no hesitancy in saying that the region

measured by the Fort Collins records offers very decided advantages over that measured by the Laramie records."

and concludes:

"To briefly sum up the principal reasons why the Poudre Valley area is, in my judgment, so much superior to the Laramie Plains area, as an agricultural region, I think I cannot do more than practically repeat the statement I have already made in my testimony. I feel that the development that is in the general Greeley District is one that is destined to produce more value per acre and greater diversity in cropping, to maintain a bigger rural population and more rural industries founded on agriculture. The general fundamental reasons for these differences, as I have already indicated, I think chiefly are soil and climate, particularly the latter, for the reason it is difficult to overcome climate, but it is possible to overcome some difficulties in soil conditions. In other words, I should regard the climate to be a more important controlling factor than soil, other things being equal, if the soil is such that crops can grow in it at all."

PRIORITY OF DIVERSIONS.

The defendants feel that priority of right as between users in different states has no place in a suit between sovereign states affecting the water of interstate streams, except possibly, that the relative priorities might be one of many factors from which the court would determine the reasonableness of the use in one state as against another, or, in other words, might be one factor in determining the equities between the states.

We believe the decision of this court in the case of Kansas vs. Colorado, 206 U. S., 46, is decisive of this contention.

However that may be, we have felt that we cannot neglect a complete review of the evidence showing the respective priorities of diversion from the Laramie River in Colorado and Wyoming, more particularly the later diversions in both states, which are more directly affected in this cause.

An extended review of the evidence upon this question, together with a discussion of the law on the subject is set forth in Part II, Volume 2 of this brief.

We believe that it will be more convenient to divide the brief in this manner, because of the great length to which we have already gone in a discussion of the more general features of the case. However, at this point, we desire to call attention to the fact that the Greeley-Poudre diversion from the Laramie

River dates from August 25, 1902, and, under the law of the State of Colorado, the priority is established by judicial decree as of that date as against all other Colorado priorities on the River. On the other hand, the evidence discloses that all of the larger diversions in Wyoming, with the exception of the Pioneer Canal and the system of works designed for the irrigation of the original Wheatland tract, are junior in point of time to the Greeley-Poudre system. The evidence discloses that the surveys for the Lake James system were begun upon March 22, 190 (638); for the Lake Hattie system, April 16, 1908 (646, 774); for the Sodergreen High Line, November, 1907 (445); for the extension of the Wheatland system to the Bordeaux tract, in February, 1904, and to the Sybille tract in August, 1907. (108.) These dates are all shown by the evidence and are further confirmed by the permits issued by the State Engineer and the Board of Control of Wyoming, which constitute the official findings of the date of priorities, subject, of course, to review as we have heretofore mentioned.

We have shown that Lake Hattie has a capacity of 110,500 acre feet, of which 68,500 acre feet is active or available capacity; Lake James has a capacity of 41,100 acre feet. We do not recall that the capacity of the Sodergreen High Line ditch is fixed, but the extension of the Wheatland canals to the Bordeaux and Sybille tracts, so far as they are constructed, are designed for the irrigation of 10,000 and 30,000 acres, respectively. It therefore appears that permits have been issued for works which are now constructed, in whole or in part, for the storage in these two reservoirs, counting active storage only, of 109,600 acre feet per annum, and in addition to these reservoirs, the irrigation of land in excess of 40,000 acres.

This statement is not intended, however, to include many other proposed projects, nor the proposed irrigation of other lands, but is limited to the five projects mentioned, all of which are junior in point of time to the Greeley-Poudre system.

The total extent of the acreage proposed to be irrigated in Wyoming by projects junior to the Greeley-Poudre system is set forth in tabulated form in the portion of the brief referred to devoted to the question of priority of diversions.

INTER-WATERSHED DIVERSIONS.

The defendants have shown that inter-watershed diversions are in existence where necessity requires throughout the world wherever irrigation is practiced. We have shown the existence of such diversions in India, some ancient and some modern works; in Italy, in France, Spain, Turkestan, in British Co-

lumbia, Alberta, Hawaiian Islands, Ceylon, and in every state in the Union where irrigation is practiced, these last projects being not only private projects, but also in some instances projects undertaken by the United States Reclamation Service, and the remarkable thing is that while the complainant denies the right of the defendants to divert water from the Laramie River into the Poudre River, nevertheless, under permits issued by the State Engineer of the State of Wyoming, which culminated in decrees by its Board of Control, affirmed on appeal by the courts of the state, Wyoming is itself at this time, and has been for many years, actively engaged in the practice of diverting water from one watershed to another. (1445-1600, Exs. 22-50.)

A monograph upon this subject, together with an exhaustive discussion of the law, is set forth in Part I, Volume 2 of this brief.

CONCLUSIONS OF FACT.

From the foregoing, it appears that the evidence discloses:

That the total flow of the Laramie River and its tributaries in both Colorado and Wyoming is something in excess of 470,000 acre feet per annum, and of that amount, 431,200 acre feet is the normal average flow of the river available above and including the Wheatland tract.

Of this total flow, Colorado furnishes at least 250,000 acre feet per annum, the evidence varying from 220,000 acre feet according to one Wyoming witness, to 250,000, 300,000 and 320,000 acre feet according to the Colorado witnesses.

Of the 250,000 acre feet furnished by the State of Colorado, we are now diverting for irrigation 20,000 acre feet per annum, and seek to divert 56,000 acre feet in addition, with a probability that at some time this 56,000 acre feet may be enlarged to 71,000 acre feet. Assuming this contingency, Colorado seeks to divert 91/250ths of its own water, and this amount marks the limit to which Colorado can go in the diversion of water from the Laramie River. The rest of the water must for all time remain in the stream for the benefit of Wyoming if she needs it.

That irrigation methods and irrigation systems in Wyoming have been and still are primitive; that necessity has never required the officers of that state to make any definite attempt at the division of the water of the stream according to the respective rights of the appropriators; that wasteful methods have prevailed and still do prevail over a large portion of the Laramie Plains area, and that the amount of water used has been far in excess of the amount actually needed, and that

Wyoming has most excellent natural storage facilities which have been, to a certain extent, utilized at a remarkably low cost.

That the only expert testifying for the State of Wyoming says that the duty of water on the Laramie Plains area is one acre foot per acre.

That the total amount of land under irrigation from the Laramie River and its tributaries in Wyoming is 108,073 acres, including 29,074 acres in the Wheatland tracts and 78,999 acres on the Laramie Plains.

That while the Wheatland area is a relatively fair agricultural district, it has an ample water supply for many times the amount of land now under irrigation, and has, in fact, diverted more water than the law of the State of Wyoming permitted or necessity required; that the Laramie Plains is an area where climatic conditions are so adverse that its agricultural development has been and will be limited to the production of hay and a few other hardy crops, capable of resisting the severity of the climate.

That the lands of the Greeley-Poudre District are dependent for reclamation upon water from the Laramie River, which, when supplied, will bring about a development within the district equal to the development in the adjacent lands in the Poudre Valley; that the development already reached in the Poudre Valley is one wherein the highest agricultural production obtains, with a possibility of still further development in the future, supporting many times the number of people per unit of area as can be or have been supported by the Laramie Plains; that the same quantity of water, applied for irrigation upon the Poudre Valley will produce from five to ten times the amount that could be produced by the application of the same amount of water upon the Laramie Plains.

That even for the sake of argument, assuming a shortage of water in the Wyoming territory effected because of the diversion to the Greeley-Poudre District, nevertheless a far greater benefit to mankind will result from the application of that water in the Poudre Valley rather than upon the Laramie Plains.

That after the diversions have been made by Colorado, there will remain available for irrigation in the State of Wyoming in the watershed of the Laramie River, far more than sufficient for its present needs, and even a surplus amount for vast increase in the amount of land under irrigation.

That the prior diversions from the stream, under the laws of the respective states, are in Colorado, and

That the diversion by Colorado from the watershed is consistent with the highest economic use permitted the world over where irrigation is a necessity.

Therefore, the defendants contend that their diversion from the Laramie River into the Poudre by means of the Greeley-

Poudre system, will in no wise injure the State of Wyoming, and that the equities between the two states are such that this use is in no wise an unreasonable exercise of the rights of the State of Colorado as a sovereignty.

ESTOPPEL.

As a portion of their third defense, the corporate defendants allege:

> "Defendants aver that the plaintiff and its citizens, long prior to the institution of this suit and at all times, were fully advised of the said diversions and proposed diversions of these defendants and their predecessors in title, and have been advised of the formation of said district, of the voting of the bonds thereof, of the sale of said bonds to innocent purchasers for value, of the said construction for the purpose of effecting said diversion, and of the steps taken by citizens in said district in reliance thereon.
>
> Defendants aver that plaintiff and its citizens are equitably estopped from questioning the diversions sought to be enjoined herein." (Pages 17-18.)

We have already observed that, commencing with August 25, 1902, work was continually prosecuted, first in engineering, then in necessary road construction, and, lastly, in canal, reservoir and tunnel construction in the high mountain regions in Colorado surrounding the Greeley-Poudre system; that road construction began in 1903 and proceeded during the working season, and that excavation on canals commenced in 1904 and was prosecuted with great diligence thereafter; that between August 25, 1902 and March, 1908, less than six years, more than $292,000 had been expended upon the Greeley-Poudre project, in addition to moneys expended for properties necessary to the successful operation thereof; and that at the time of the trial of this cause, the Greeley-Poudre tunnel, 2½ miles in length, and rivaling in magnitude the works of the Government of the United States, had been completed through the mountain chain between the two rivers at a cost of $600,000.00, and concrete lining had been installed wherever necessary at an additional cost of over $20,000. More than $250,000 had been expended on the collection ditches in the Laramie River drainage and more than $1,825,000 in cash on construction on the general system prior to the filing of the bill of complaint herein on May 29, 1911.

In carrying on this gigantic work, supplies, machinery and labor were freighted by wagon train from Laramie and other Wyoming shipping points across the Laramie Plains and up the Laramie River Valley in both Colorado and Wyoming. From 1902 until after the filing of this suit, these activities in Colorado were well known to the officials of Wyoming and to her citizens along the Laramie River Valley in that state (2064), and no action was taken to prevent construction of the Greeley-Poudre enterprise during the years 1902-11 inclusive, during all of which time open and notorious ditch and tunnel construction was proceeding with large forces of men, teams and machinery, while Wyoming and her citizens stood idly by without protest, while Colorado and her citizens proceeded to construct the enterprise and to make the enormous expenditure above mentioned.

Notwithstanding that Wyoming and her citizens well knew of the opening of the Colorado project in the early years of 1902-3, plaintiff took no action to utilize or divert the enormous quantity of unappropriated water still remaining available in the Laramie River, until about the close of the year 1907, and March and April in 1908, at which time the new and theretofore uninitiated Lake James, Lake Hattie and Wheatland projects were first commenced. These new projects were authorized by plaintiff State when she well knew that the State of Colorado and her citizens had, almost six years prior thereto, appropriated a portion of the remaining waters of the Big Laramie River, and well knew that the Colorado appropriators were proceeding in good faith to complete their enterprise with diligence.

In view of the entire record, and particularly those facts above mentioned concerning which there is little, if any, contradiction, it would seem needless to further urge that plaintiff State and its citizens are guilty of laches and remained silent when they should have spoken and that they are now estopped to here deny the State of Colorado the right to divert and beneficially use a portion of the waters of the Laramie River so rising and flowing within her borders, and which, were it not for her Greeley-Poudre diversion, must flow out across neighboring states and into the Gulf of Mexico while her otherwise fertile lands remain forever arid and non-productive.

New York City vs. Pine, 185 U. S. 93, 98.

If it be asserted that certain letters of September, 1909, purporting to have been sent to certain interested individuals by an official of Wyoming, constitute even the semblance of protest, let it be remembered that these letters were first written and sent more than seven years after the Greeley-Poudre project in Colorado had been initiated, and during all of which

time construction had been proceeding upon the entire system both in the Laramie and Cache la Poudre valleys, and that over $800,000.00 (2159) had already been expended upon the same and identical system now in process of completion for the Greeley-Poudre Irrigation District which stands simply in the relation of a purchaser of the project definitely planned and in a large measure constructed long before the formation of the defendant district and the writing of the aforesaid letters.

Let it be further remembered that the same official who uttered this tardy communication continued thereafter to find that still unappropriated waters existed in the Laramie River and to issue new permits to still other new and junior projects in Wyoming, thereby solemnly proclaiming to all the world that unappropriated water remained after supplying all prior and other diversions from the Laramie River, and in effect finding that the statements contained in his communication were ill-advised and unfounded. It would be unreasonable to argue at that late hour that the fortunes so invested and all the many obligations assumed and undertaken on faith of the Greeley-Poudre enterprise could or would be lightly cast aside and utterly abandoned upon so tardy a murmur of protest.

The official acts, permits and decrees of plaintiff State, adjudicating in advance a water supply for irrigation of more than 278,000 acres of land to new projects first initiated and undertaken six years and more subsequent to the initiation of the Greeley-Poudre project in Colorado, estop her to now say that the small diversion to be made by the Greeley-Poudre project can in any wise injure any prior or other projects in Wyoming, for so to do is to admit that each of the new permits (1907-8 and subsequent) is, upon its face, false and untrue, and the promulgation of a fraud by and under the sanction of plaintiff State upon every investor in any newly permitted enterprise and every land owner thereunder.

Wyoming, by her own statute of limitations, is precluded and estopped to assert any claim other than that set forth in her quasi-judicial decrees and permits, by all of which she asserts that after all Colorado diversions there must still ever remain ample water in the Laramie River to justify the construction, operation and use in other new and junior Wyoming enterprises without injury to other appropriators.

The entire record furnishes ample ground to assert that Wyoming and her citizens are estopped to here deny Colorado and her citizens the right to divert a portion of the water rising and flowing within her own borders for the irrigation and reclamation of her lands, and the development and use of her own resources in the manner and to the degree permitted by the Greeley-Poudre system.

THE LAW OF THE CASE.

We have now discussed the facts of this case and to them, as summed up, we will endeavor to apply the law of the case.

When Colorado became a state in 1876, she became sovereign within the limits of her territory except as to the limited and enumerated powers given to the national government. She became the owner, in her sovereign capacity, independent of and behind her people as to all her great natural resources such as air, light and water, with equal rights as the original thirteen states.

> "One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none."
>
> Kansas vs. Colorado, 206 U. S., 97.

The State of Colorado and the State of Wyoming respectively have the same equal rights as any one of the thirteen original states, and as to the waters of their interstate streams, their respective rights are the same as to the waters thereof within their limits as though they were one of the original thirteen states, except as to the factors of the waters being of an interstate stream and in an arid country. The controversy is not one between private parties, as in Bean vs. Morris, 221 U. S. 485; Rickey vs. Miller & Lux, 218 U. S. 258, which cases will be hereinafter discussed, but is a case between two sovereign commonwealths insisting respectively upon the waters here in controversy, Colorado insisting upon making the diversion in her right as a sovereign commonwealth and Wyoming insisting in the same capacity on the right being denied.

Mannville Co. vs. Worcester, 138 Mass., 89, decided in 1884, opinion by Mr. Justice Holmes, then of the Supreme Court of Massachusetts and now and for many years last past a Justice of the Supreme Court of the United States, was an action of tort for diverting the waters of a natural stream in the Commonwealth of Massachusetts and preventing the same from coming to plaintiff's mill in the adjoining state of Rhode Island. The action was treated as an action between private parties. It was held that it would lie upon the ground that the servitude was being exercised with the presumed consent of the Commonwealth of Massachusetts. It is clear, however, throughout the opinion that if the Commonwealth of Massachusetts were objecting, the objection would be effective and that it was compe-

tent for Massachusetts to control the great natural resources within her limits. *Inter alia the* court said:

> "A concurrence of the laws of both States is as necessary in that case as in the one at bar, to create a liability which can be enforced in either State consistently with principle. * * *
>
> Of course, the laws of Rhode Island cannot subject Massachusetts land to a servitude, and, apart from any constitutional considerations, if there are any, which we do not mean to intimate, Massachusetts might prohibit the creation of such servitudes. So it might authorize any acts to be done within its limits, however injurious to lands or persons outside them. But it does not do either. It has no more objection to a citizen of Rhode Island owning an easement, as incident to his ownership of land in that State, than it has to his owning it in gross, or to his purchasing lands here in fee. * * * So far as their creation is concerned, the law of Massachusetts governs, whether the mode of creation be by deed or prescription, or whether the right be one which is regarded as naturally arising out of the relation between the two estates; being created, the law of Rhode Island, by permission of that of Massachusetts, lays hold of them and attaches them in such way as it sees fit to land there, Massachusetts being secured against anything contrary to its views of policy by the common traditions of the two States, and by the power over its own territory which *it holds in reserve.*"

The language contained in this opinion becomes more significant as we read the opinions of the Supreme Court of the United States as to the questions there involved, wherein that court speaks through the same jurist, Mr. Justice Holmes.

Hudson Water Co. vs. McCarter, 209 U. S., 353, opinion by Mr. Justice Holmes, decided in 1907. Here the question was between a private party and the State of New Jersey, the state being represented by its Attorney General, McCarter. The defendant, the Hudson Water Company, under a contract with the City of Bayonne, in New Jersey, had laid mains for the purpose of carrying water to Staten Island in the State of New York. By other contracts it was to get the water from the Passaic River at Little Falls, where the East Jersey Water Company has a large plant by which the water is withdrawn. The State of New Jersey, reciting the need of preserving the fresh water of the state for the health and prosperity of the citizens, enacted that it should be unlawful to transport the waters of any river of the state into any other state for use therein. Action

was brought by the State of New Jersey to enjoin carrying the waters of the Passaic River out of the state. The action was sustained. *Inter alia* the court said:

> "But we prefer to put the authority which cannot be denied to the state upon a broader ground than that which was emphasized below, since in our opinion it is independent of the more or less attenuated residuum of title that the State may be said to possess. * * *
>
> It sometimes is difficult to fix boundary stones between the private right of property and the police power when, as in the case at bar, we know of few decisions that are very much in point. But it is recognized that the State as quasi-sovereign and representative of the interests of the public has a standing in court to protect the atmosphere, the water and the forests within its territory, *irrespective of the assent or dissent of the private owners of the land most immediately concerned.* Kansas v. Colorado, 185 U. S. 125, 141, 142; Id. 206 U. S. 46, 99; Georgia v. Tennessee Copper Co., 206 U. S. 230, 238. What it may protect by suit in this court from interference in the name of property outside of the State's jurisdiction, one would think that it could protect by statute from interference in the same name within. On this principle of public interest and the police power, and not merely as the inheritor of a royal prerogative, the State may make laws for the preservation of game, which seems a stronger case. Geer vs. Connecticut, 161 U. S. 519, 534."
>
> "It appears to us that few public interests are more obvious, indisputable and independent of particular theory than the interest of the public of a State to maintain the rivers that are wholly within it substantially undiminished, except by such drafts upon them as the guardian of the public welfare may permit for the purpose of turning them to a more perfect use."
>
> "But we agree with the New Jersey courts, and think it quite beyond any rational view of riparian rights that an agreement, *of no matter what private owners*, could sanction the diversion of an important stream outside the boundaries of the State in which it flows. *The private right to appropriate* is subject not only to the rights of lower owners but to the initial limitation that it *may not substantially diminish one of the great foundations of public welfare and health.*
>
> We are of opinion, further, that the constitutional power of the State to insist that its natural advantages

shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and there are benefits from a great river that might escape a lawyer's view. But the State is not required to submit even to an aesthetic analysis. Any analysis may be inadequate. It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will. * * *

It constantly is necessary to reconcile and to adjust different constitutional principles, each of which would be entitled to possession of the disputed ground but for the presence of the others, as we already have said that it is necessary to reconcile and to adjust different principles of the common law. * * * The right to receive water from a river through pipes is subject to territorial limits by nature, and those limits may be fixed by the State within which the river flows, even if they are made to coincide with the state line."

The court, in the course of the opinion, says:

"Problems of irrigation have no place here."

The opinion shows, however, the rights of a sovereign state in the streams of the state, when such right is unaffected by and is not required to be reconciled with the problem of irrigation.

Walbridge vs. Robinson, 22 Idaho 240, decided in 1912, was an appeal from an order granting a writ of mandate resulting in a reversal of the lower court. Respondent made an application to the state engineer for a permit to appropriate water from Bear Creek, a branch of Clear Water River, situate in Idaho County. This application was for the diversion of waters to be carried and applied to irrigation in the state of Montana. The permit was issued. Prior to its issuance, a similar permit had been granted for the diversion of waters from Bear Creek to be carried and used in the State of Montana. Subsequent to the issuance of these permits, a contest was filed by the respondents and after a hearing, the state engineer refused to take any action on the matter or grant any relief to either of the parties upon the ground that in issuing the permits he had exceeded his lawful authority in attempting to grant a right for the diversion of waters of that state to be applied to a beneficial use in another state. Thereafter respondents asked that they be given certificate of the completion of their works. The engineer

refused to take action on the ground that he had no authority to grant such certificate. A suit was thereupon instituted. Bear Creek was not an interstate stream, but located wholly within the State of Idaho. There was a declaration of the constitution as to the ownership of waters similar in legal effect to our own. Commenting thereon the court said:

> "It is further contended that this latter declaration of the statute is only a written expression of what the law has always been with reference to the public waters of a state.
>
> Freund, in his work on the Police Power of the state, at sec. 417, seems to entertain this view, and in discussing similar statutes in other states, says: 'Such declaration is expressive of what is believed to be the law, and does not intend to make new law.'
>
> We think it is clear that the title to the public waters of the state is vested in the state for the use and benefit of all the citizens of the state under such rules and regulations as may be prescribed from time to time by the law-making power of the state. This is not, however, an interest or title in the proprietary sense, but rather in the sovereign capacity as representative of all the people for the purpose of guaranteeing that the common rights of all shall be equally protected and that no one shall be denied his proper use and benefit of this common necessity. * * *
>
> There is no doubt in our minds but that the state in its sovereign capacity is the owner of the waters flowin the streams thereof and may exercise its authority over the same. If the foregoing propositions be correct, the state has the right to prohibit the diversion of the waters of its stream for use outside of and beyond the boundaries of the state. In other words, as said by the supreme court in Geer v. Connecticut, supra, 'The common ownership imports the right to keep the property, if the sovereign so chooses, always within its jurisdiction for every purpose.' "

The sovereign right of each one of the states of this Union of states to own and protect its great natural resources and its privilege to come into this court and ask legal protection of the right to such great natural resources appears through these cases.

In Missouri vs. Illinois, 180 U. S., 208, and 200 U. S. 496, the latter decided in 1905, opinion by Mr. Justice Holmes; Kansas vs. Colorado, 185 U. S. 125, and 206 U. S. 46, decided

in 1906; Georgia vs. Tennessee Copper Co., 206 U. S., 230, 237 U. S. 474, opinion by Mr. Justice Holmes.

It is clear that there is a sovereign right in the state independent of and behind the title of its citizens in its great natural resources, and that this court has jurisdiction of the legal contest to protect and enforce such rights. Further, that the extent to which a sovereign state may insist on this right largely rests with her. In Hudson Water Co. vs. McCarter, supra, it is said:

> "It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will."

In Missouri vs. Illinois, the court recognized the right of Missouri to come by original suit into this court and protect its citizens against any contamination that might arise through sewage of the city of Chicago being turned into a tributary of the Missouri River.

In Georgia vs. Tennessee Copper Company, a bill in equity was filed in pursuance of a resolution of the legislature and by direction of the Governor of Georgia, to enjoin defendant copper company from discharging noxious gas from their works in Tennessee over the plaintiff's territory. *Inter alia*, the court said:

> "The case has been argued largely as if it were one between *two private parties;* but it is not. The very elements that would be relied upon in a suit between fellow-citizens as a ground for equitable relief are wanting here. The State owns very little of the territory alleged to be affected, and the damage to it capable of estimate in money, possibly, at least, is small. This is a suit by a State for an injury to it in its capacity of quasi-sovereign. In that capacity the State has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain. It has the last word as to whether its mountains shall be stripped of their forests and its inhabitants shall breathe pure air. It might have to pay individuals before it could utter that word, but with it remains the final power. The alleged damage to the State as a private owner is merely a makeweight, and we may lay on one side the dispute as to whether the destruction of forests has led to the gullying of its roads. * * *
>
> They (states) did not renounce the possibility of making reasonable demands on the ground of their still remaining quasi-sovereign interests; and the alternative to force is a suit in this court. * * *

> The States by entering the Union did not sink to the position of *private owners subject to one system of private law.* * * * Without excluding the considerations that equity always takes into account, we cannot give the weight that was given them in argument to a comparison between the damage threatened to the plaintiff and the calamity of a possible stop to the defendants' business, the question of health, the character of the forests as a first or second growth, the commercial possibility or impossibility of reducing the fumes to sulphuric acid, the special adaptation of the business to the place.
>
> It is a fair and reasonable demand on the part of a sovereign that the air over its territory should not be polluted on a great scale by sulphurous acid gas, that the forests on its mountains, be they better or worse, * * * should not be further destroyed or threatened by the act of persons beyond its control, that the crops and orchards on its hills should not be endangered from the same source. If any such demand is to be enforced this must be, notwithstanding the hesitation that we might feel if the suit were *between private parties*, and the doubt whether for the injuries which they might be suffering to their property they should not be left to an action at law. * * *
>
> Whether Georgia by insisting upon this claim is doing more harm than good to her own citizens is for her to determine. The possible disaster to those outside the State must be accepted as a consequence of her standing upon her extreme rights."

The cause of the suit was an insistence upon the right of Georgia to be protected in the reasonable enjoyment of her rights of sovereignty. The plaintiff prevailed. The case did not proceed upon the theory of the litigation being between private parties, but upon the fact of peculiar rights inhering in litigants with sovereign powers.

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S., 258, decided in 1910, opinion by Mr. Justice Holmes, was an action between private parties in reference to the waters of an interstate stream and the character of that action is carefully distinguished from a case wherein the sovereignty itself is insisting upon its right to the waters of a stream. Miller & Lux, the corporation using the water of Walker River in Nevada, claimed rights therein. Two branches of the river rise in California and unite in Nevada above Miller & Lux. Rickey used water of both branches in California and claimed rights superior to parties lower down. In 1902 Miller & Lux brought suit in the

circuit court for the district of Nevada against Rickey and certain other defendants to enjoin interference with its use of water. Rickey pleaded that the diversion by him was in California and later answered. After appearing, he organized the petitioning corporation and conveyed his rights in California to it. In 1904 this corporation began two actions in the state court of California against Miller & Lux, and others, to quiet its title to certain water rights on the west fork and east fork, supra. In December, after they were served with process in the last mentioned suit, other defendants in the bill brought by Miller & Lux brought a cross bill against Rickey to establish their priorities. In 1906 the bills in these present cases were brought by Miller & Lux to restrain proceedings in the California actions on the ground that the Federal Court had acquired jurisdiction before the California actions were begun. Injunctions were granted. *Inter alia* the court said:

> "The petitioner contends that there is no conflict of jurisdiction, and that the proceedings in the California court should go on. Its argument is this: When a right is asserted in favor of land in one jurisdiction over land in another, different principles are involved from those that suffice when both parcels are subject to the same law. When such rights have been recognized, it has been on the ground of an assumed 'concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted. Mannville Co. vs. Worcester, 138 Mass., 89.' Missouri vs. Illinois, 200 U. S., 496, 521. But still there are two parcels of land subject to different systems of law; and although the rights and liabilities in respect of each may require a consideration of the other if they are to be dealt with completely, the fact remains that each may be regulated by the state where the land lies according to its sovereign will. Kansas vs. Colorado, 206 U. S. 46, 93. If, then, the courts of one state are about to deal with one parcel they should not be indirectly interfered with by a foreign court that has no power to control the use of the *res*. It is said to be a general principle that apart from some privity, such as is created by contract, trust, or fraud, courts of equity recognize the impropriety of using their power over the person to achieve such a result. (Citing cases.) It is conceivable, to be sure, that the decisions of this court may determine that the States have rights as against each other *in invitum* in streams that flow through the land of both. Kansas vs. Colorado, 206 U. S. 46, 84; Missouri vs. Illinois, 200 U. S. 496, 519-20. These rights may vary according to the

system of law required by natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older states. See New York vs. Pine, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper state, at least in the watershed of the stream, where irrigation is the condition of using the land. See Kansas vs. Colorado, 206 U. S., 46, 100-104, 117. *But whatever this court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state*, and those rights, the petitioner insists, can, or at least should be, determined only in a suit brought by the state itself. * * * To affect a purchaser with a suit against his vendor, it is said that at least the *res* must be within the territorial jurisdiction of the court in which the suit is brought. See Fall vs. Eastin, 215 U. S. 1.

We are of the opinion that the petitioner fails to establish the conclusion for which it contends. The alleged rights of Miller and Lux involve a relation between parcels of land that cannot be brought within the same jurisdiction. This relation depends as well upon the permission of the laws of Nevada as upon the compulsion of the laws of California. It is true that the acts necessary to enforce it must be done in California, and require the assent of that state so far as this court does not decide that they may be demanded as a consequence of whatever right, if any, it may attribute to Nevada. But, leaving the latter possibility on one side, if California recognizes private rights that cross the border line, the analogies are in favor of allowing them to be enforced within the jurisdiction of either party to the joint arrangement."

The decree below was approved. The court, however, makes it clear that the suit was between private parties and that the right of land owned by a private party in Nevada to claim a servitude upon the California lands was based upon the assumed consent of California. Particularly worthy of note is the contention of petitioner, the reasons assigned in which the court does not apparently differ from but only differs in the conclusion. In this argument it is recognized that the rights of individuals in waters of an interstate stream are subordinate and inferior to the rights that the sovereign may claim when it asserts its own.

Bean vs. Morris, 221 U. S., 485, decided in 1910, opinion by Mr. Justice Holmes, is again a suit between private parties over the waters of an interstate stream, and the learned justice keeps in bold relief that there is a distinction between such a contention when the litigants are sovereign states. The suit was by respondent Morris to prevent petitioners from so diverting the water of Sage Creek in Montana as to interfere with an alleged prior right of Morris by appropriation in Wyoming. Afterwards Howell was allowed to intervene and make similar claim. Sage Creek, non-navigable, joins Stinking Water in Wyoming, the latter flows into Big Horn and then back into Montana and unites with the Yellowstone. Decree went for Morris and for Howell subject to the claim of Morris, both parties being prior in time and right to the petitioners. It was admitted in argument that but for the fact that the prior appropriation was in Wyoming and the interference in Montana, the decree would be right. The court, *inter alia*, said:

> "So we pass at once to the question of private water rights as between users in different states.
>
> We know no reason to doubt, and we assume, that, subject *to such rights as the lower state might be decided by this court to have*, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that state. Kansas vs. Colo., 206 U. S., 46, 93-95. Therefore, *subject to the same qualifications*, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521; Rickey Land and Cattle Company vs. Miller and Lux, 218 U. S., 258, 260. But with regard to such rights as came into question in the older States, *we believe that it always was assumed, in the absence of legislation to the contrary*, that the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state that could be acquired from within." (Mannville Co. vs. Worcester, 138 Mass., 89, and other cases cited.) "There is even stronger reason for the same assumption here. Montana cannot be presumed to be intent on suicide, and there are as many if not more cases in which it would lose as there are in which it would gain, if it invoked a trial of strength with its neighbors. * * * The doctrine of appropriation has prevailed in these regions probably from the first moment that they knew

any law, and has continued since they became territory of the United States.

It was recognized by the statutes of the United States, while Montana and Wyoming were such territory * * * and is recognized by both States now. Before the state lines were drawn, of course, the principle prevailed between the lands that were destined to be thus artificially divided. Indeed, Morris had made his appropriation before either state was admitted to the Union. The only reasonable presumption is that the States, upon their incorporation, continued the system that had prevailed theretofore, *and made no changes other than those necessarily implied or expressed.* * * * It follows from what we have said that it is unnecessary to consider what limits there may be to the powers of an upper State, if it should seek to do all that it could. The grounds upon which such limits would stand are referred to in Rickey Land and Cattle Company vs. Miller and Lux, 218 U. S., 258, 261."

The decree below is affirmed, the court finding that the Wyoming lands held a servitude upon the Montana lands upon the theory that as between private parties, the State of Montana was presumed to have consented, but is strongly suggestive that the right to appropriate at the expense of Montana was subject to the will of Montana as a state and such limits as might be put upon her sovereignty by the doctrine of interstate waters.

The great case in which the rights of sovereign states in the waters of an interstate stream, where the problems of irrigation had place, are presented, discussed and decided in Kansas vs. Colorado, 206 U. S., 46, decided in 1906, opinion by Mr. Justice Brewer. Of this case a great lawyer and an eloquent senator from this commonwealth recently said in the Senate of the United States:

> "The decision in the case of Kansas vs. Colorado is one of the great opinions of the Supreme Court of the United States. To my mind it easily ranks with the most notable judicial pronouncements of that great tribunal and, as time passes, I believe that fact will be more and more recognized; perhaps I should say particularly with reference to its definition of the powers of the government and the distinction it so clearly draws between those powers and the reserved powers of the states."

Kansas brought suit against the State of Colorado and a number of private ditch companies for the purpose of enjoining

them from diverting waters from the Arkansas River. The State of Colorado appeared insisting upon her rights in the stream as one of her sovereign rights. The ditch companies answered, setting up their priorities. Proof was adduced as to the priorities of certain ditches in Kansas earlier in point of time than Colorado ditches and which Kansas ditches, the evidence showed, were deprived of water by the Colorado diversions. The Government of the United States intervened. Its bill of intervention was dismissed upon the ground that it did not own the waters of the Arkansas River, that it had no rights therein as the question of navigation did not arise, and it was dismissed from the suit. It is difficult to understand, after the ruling in this great and luminous case, that the Government of the United States still insists, through some of its departments, on being interested in non-navigable streams. It may be said, however, that when waters are sought to be appropriated from the streams of any state for any national government project, the National Government deems it to be the safe course to comply with the state laws as any other consumer would in his efforts to acquire rights by prior appropriation in the waters of a stream.

The careful reasoning of the court in approaching its ruling in this case, that it was keeping constantly before its mind in deciding the grave question it was ruling between two sovereign commonwealths, the principle laid down by the court in the sewage case, Missouri vs. Illinois, 200 U. S., 521, wherein it is said:

> "Before this court ought to intervene the case should be of serious magnitude, clearly and fully proved, and the principle to be applied should be one which the court is prepared deliberately to maintain against all considerations on the other side."

In perhaps no case in the history of this great court has there been shown greater and more thoughtful care in guarding the rights of the states than in this case of Kansas vs. Colorado. An unjust decision might have destroyed the agricultural resources of a state which, resting upon the crest of the continent where the waters begin which flow to the east, to the west, to the north and the south, and where a declaration of the applicability of the riparian rights would have visited with destruction not only the development of the Arkansas valley, but the other great valleys of Colorado, the court, conforming to the principles of common law, international law and state law, rendered a decision which fully protected the rights of the litigants and declared no precedent that would be destructive to the rights of the states in future litigation.

The pith of this ruling, when fully considered, is that the common law adjusted itself to conditions as it found them, aiming to administer the highest justice between man and man; that applying its principles and all other principles of jurisprudence in the relations between the states, it was the controlling purpose of the court to work out justice; that as to this interstate stream in the reasonable exercise of their respective sovereign rights, each of the states was entitled to a reasonable part of the waters; that the court would not consider the question of private rights among the ditch companies; that the disposition of the rights of the two states would be a disposition of the rights of the private parties, for the reason that the rights of the private parties were subordinate to the rights of the states; that if the court found, as it did find, that Colorado was not diverting from this stream any more than a reasonable part of the waters of the stream and for that reason the bill must be dismissed, that the rights of the private ditch companies and their priorities were immaterial.

In conclusion, the court held that Colorado was not taking more than a reasonable part of the waters of this interstate stream; that she was entitled to take a reasonable part in the exercise of her rights of sovereignty; that even though this exercise of a right of sovereignty worked some prejudice to Kansas, no legal wrong was done; that if, at any time it might appear that Colorado was taking more than a reasonable part of the waters of this stream, Kansas could justly come again. The bill was dismissed.

Excerpts from this decision pertaining to the question before us are:

> "But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that each State has full jurisdiction over the lands within its borders, including the beds of streams and other waters." 93.
>
> "But when the States of Kansas and Colorado were admitted into the Union they were admitted with the full powers of local sovereignty which belonged to other States, * * * and Colorado by its legislation has recognized the right of appropriating the flowing waters to the purposes of irrigation." 95.
>
> "'Can it be that the great multitude of interstate commercial transactions are freed from the burdens created by the common law as so defined, and are subject to no rule except that to be found in the statutes of Congress? We are clearly of opinion that this cannot be so, and that the principles of the common law are oper-

ative upon all interstate commercial transactions except so far as they are modified by Congressional enactment.'" 96.

"For after all, the common law is but the accumulated expressions of the various judicial tribunals in their efforts to ascertain what is right and just between individuals in respect to private disputes." 97.

"Nor is our jurisdiction ousted, even if, because Kansas and Colorado are States sovereign and independent in local matters, the relations between them depend in any respect upon principles of international law. International law is no alien in this tribunal." 97.

"'Sitting, as it were, as an international, as well as a domestic tribunal, we apply Federal law, state law, and international law, as the exigencies of the particular case may demand.'

One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest." 97.

"Yet, whenever, as in the case of Missouri v. Illinois, 180 U. S. 208, the action of one State reaches through the agency of natural laws into the territory of another State, the question of the extent and the limitations of the rights of the two States becomes a matter of justiciable dispute between them, and this court is called upon to settle that dispute in such a way as will recognize the equal rights of both and at the same time establish justice between them. In other words, through these successive disputes and decisions this court is practically building up what may not improperly be called interstate common law." 97, 98.

"It will be perceived that Kansas asserts a pecuniary interest as the owner of certain tracts along the banks of the Arkansas and as the owner of the bed of the stream. We need not stop to consider what rights such private ownership of property might give." 98.

"The action complained of is state action."

"The controversy arises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint." 99.

"May we not consider some appropriation by Colorado of the waters of the Arkansas to the irrigation and reclamation of its arid lands as a reasonable exercise of its sovereignty and as not unreasonably trespassing upon any rights of Kansas?" 102.

"What is such a just and reasonable use, may often be a difficult question, depending on various circumstances. To take a quantity of water from a large running stream for agricultural or manufacturing purposes, would cause no sensible or practicable diminution of the benefit, to the prejudice of a lower proprietor; whereas, taking the same quantity from a small running brook passing through many farms, would be of great and manifest injury to those below, who need it for domestic supply or watering cattle; and therefore it would be an unreasonable use of the water, and an action would lie in the latter case and not in the former. It is, therefore, to a considerable extent a question of degree; still, the rule is the same, that each proprietor has a right to a reasonable use of it, for his own benefit, for domestic use, and for manufacturing and agricultural purposes." 103-4.

"At one time there were some irrigating ditches in these western (Kansas) counties, which promised to be valuable in supplying water and thus increasing the productiveness of the lands in the vicinity of the stream, and it is true that those ditches have ceased to be of much value, the flow in them having largely diminished.

It cannot be denied in view of all the testimony * * * that the diminution of the flow of water in the river by the irrigation of Colorado has worked some detriment to the southwestern part of Kansas, and yet when we compare the amount of this detriment with the great benefit which has obviously resulted to the counties in Colorado, it would seem that equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation." 113-114.

"Summing up our conclusions, we are of the opinion * * * that the appropriation of the waters of the Arkansas by Colorado, for purposes of irrigation, has diminished the flow of water into the State of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both States and the right of each to receive benefit through irrigation

and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes.

The decree which, therefore, will be entered will be one dismissing the petition of the intervener, without prejudice to the rights of the United States to take such action as it shall deem necessary to preserve or improve the navigability of the Arkansas River. The decree will also dismiss the bill of the State of Kansas as against all the defendants, without prejudice to the right of the plaintiff to institute new proceedings whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations or citizens, the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two States resulting from the flow of the river." 117-118.

The ruling was that each state was entitled to an equitable apportionment of benefits between the two states resulting from the flow of the river, which equitable apportionment of benefits could only be secured through an equitable apportionment of the waters of this interstate stream.

The doctrine of prior appropiation has at all times obtained in Colorado and Wyoming.

> "The doctrine of appropriation has prevailed in this region probably from the first moment that they knew of any law, and has continued since they became territory of the United States."
>
> Bean vs. Morris, 221 U. S. 485.

It was recognized by the statutes of the United States while Colorado and Wyoming were territories.

> United States vs. Rio Grande, 174 U. S., 690.
>
> Gutierres vs. Albuquerque, 188 U. S., 545.

When Colorado became a state in 1876, in its sovereign capacity it became the owner, for the benefit of its people in common, of all the waters of the streams of the state.

See—

Walbridge vs. Robinson, 22 Ida., 240.

Also—

Colorado Enabling Act, Colorado Constitution, and Proclamation of President, supra.

Colorado, in this suit, insists upon her claim to divert 91,000 acre feet of water of this interstate stream. This is a reasonable exercise of her rights of sovereignty as to this interstate stream. She requires the water for necessary public uses. It will produce larger results within her boundaries than elsewhere. She is not unreasonably trespassing upon Wyoming in thus reasonably exercising her rights. The only reasonable way in which this right can be availed of is to apply the waters to lands lying within another watershed. The right to carry water to another watershed is necessary for its beneficial use within the State of Colorado.

In Coffin et al. vs. Left Hand Ditch Co., 6 Colo., 443, it is said:

> "The doctrine of priority of right by priority of appropriation for agriculture is evoked, as we have seen, by the imperative necessity for artificial irrigation of the soil. And it would be an ungenerous and inequitable rule that would deprive one of its benefit simply because he has, by large expenditure of time and money, carried the water from one stream over an intervening watershed and cultivated land in the valley of another. It might be utterly impossible, owing to the topography of the country, to get water upon his farm from the adjacent stream; or if possible, it might be impracticable on account of the distance from the point where the diversion must take place and the attendant expense; or the quantity of water in such stream might be entirely insufficient to supply his wants. It sometimes happens that the most fertile soil is found along the margin or in the neighborhood of the small rivulet, and sandy and barren land beside the larger stream. To apply the rule contended for would prevent the useful and profitable cultivation of the productive soil, and sanction the waste of water upon the more sterile lands. It would have enabled a party to locate upon a stream in 1875, and destroy the value of thousands of acres, and the improvements thereon, in adjoining valleys, possessed and cultivated for the preceding decade. Under the principle contended for, a party owning land ten miles from the stream, but

in the valley thereof, might deprive a prior appropriator of the water diverted therefrom whose lands are within a thousand yards, but just beyond an intervening divide." 449-450.

In the syllabus of the same case and supported by the opinion, it appears:

"The right to water acquired by prior appropriation is not in any way dependent upon the *locus* of its application to the beneficial use designed."

Other cases in Colorado announcing the same doctrine are:

Thomas vs. Guiraud et al., 6 Colo., 530-532.

Hammond vs. Rose et al., 11 Colo., 524-526.

Openlander vs. Left Hand Ditch Co., 18 Colo., 142-144.

Coffin vs. Left Hand Ditch Co. is cited with approval in Moyer vs. Preston, 6 Wyo., 308, 313, 321; Willey et al. vs. Decker, 11 Wyo., 496, 516, 528, 530.

The Left Hand Ditch case is cited with approval in support of the doctrine that water may be diverted to non-riparian lands

in Boquillas Cattle Co. vs. Curtis Co., 213 U. S., 339, 345; also 181 Fed., 1014, 1015.

An exhaustive discussion of the practise and the law of inter-watershed diversions is set forth in Vol. 2 of this brief.

We respectfully submit that when the law is applied to the facts in this case, it appears that the appropriations by Colorado to the irrigation and reclamation of its arid lands of 91,000 acre feet of the run-off of the Laramie River is but a reasonable exercise of its sovereignty and does not constitute an unreasonable trespass upon the rights of Wyoming, and further, that she is simply availing herself of her own great natural resources in making this proposed diversion. The action should be dismissed at the cost of complainant.

FRED FARRAR,
Attorney General of the State of Colorado;

DELPH E. CARPENTER,
Attorney for The Greeley-Poudre Irrigation District;

JULIUS C. GUNTER,
Attorney for The Laramie-Poudre Reservoirs and Irrigation Co.

APPENDIX

LIST OF DEFENDANTS' EXHIBITS.

The complainant's exhibits are designated by the letters of the alphabet. The defendants' exhibits are numbered.

Exhibits:

1. Map of the Laramie and Cache la Poudre Rivers, attached to the answer of the corporate defendants.
2. Map showing irrigated lands, Wheatland, Bordeaux and Sybille tracts.
21. Sketch Map, drainage area of Western States.
22. Sketch Map, Jumna Western and Eastern Canals, India.
23. Map, Punjab Project, India.
24. Map, United Provinces of Agra and Oudh, India.
25. Map, Periyar Project, India.
26. Map, Madras Presidency, India.
27. Map, Bouches du Rhone, France.
28. Map, Carpentras Canal, France.
29. Map, Gap Canal, France.
30. Photograph, Aqueduct, Pont du Gard, France.
31. Photograph, Tunnel, Aqueduct Pont de Gard, France.
32. Photograph, Masonry Aqueduct Craponne Canal, France.
33. Photograph, Aqueduct Carpentras Canal, France.
34. Photograph, Aqueduct Carpentras Canal, France.
35. Sketch Map, Cavour Canal, Italy.
36. Sketch Map, Villoresi Canal, Italy.
37. Sketch Map, White Mud River Project, Canada.
38. Sketch Map, Elbow River Project, Canada.
39. Sketch Map, Red Deer Project, Canada.
40. Photograph, Head-works Cavour Canal, Italy.
41. Photograph, Intake, Cavour Canal.
42. Photograph, Naviglio Grande, Italy.
43. Sketch Map, Strawberry Valley Project, U. S. Reclamation Service, Utah.
44. Map, Milk River Project, Montana.
45. Sketch Map, Los Angeles Aqueduct.
46. Sketch Map, drainage areas, Colorado, Montana, Wyoming.
47. Map, Powder River Project, Wyoming.
48. Map, irrigated land, Powder River Project.
49. Three Sketch Maps, Inter-watershed diversions, Wyoming.
50. Sketch Map, Inter-watershed diversion, Wyoming.
51. Copy of map and statement, Laramie-Poudre Tunnel and collection ditches, filed in office State Engineer, Colo., October 6, 1904.

52-72. Photographs of early work on Greeley-Poudre System on the Laramie River, 1902-1904.

73. Photograph, Skyline Canal.
74. Copy of map and statement, Link Lake Ditch and feeders, filed in State Engineer's office, Colo., Oct. 15, 1902.
75. Copy of map, East Fork Ditch and Reservoir, filed in State Engineer's office, Colo., May 9, 1904.

76-85. Photographs of upper works of Greeley-Poudre System on Laramie River, 1907-1912.

86-104 Blue print diagrams, based on Census Reports, decades 1870 to 1910, inclusive, comparing Larimer and Weld counties, Colorado, with Laramie and Albany counties, Wyoming,—size, population, rural population, agricultural production and live stock.

105. Plat showing minimum temperatures, 1893 to 1912, inclusive, Greeley, Colo., and Laramie, Wyo.

106-112. Photographs showing crop and soil conditions, Laramie Plains, Wyoming.

113. Tabulation, flow of water from Cache la Poudre River to South Platte River, 1909-1913.

Exhibits:

114. Plane table survey plats, Laramie Plains.
115. Album of Photographs of diversion works on Big and Little Laramie Rivers, Laramie Plains, Wyoming.
116. Album of Photographs, farm and ranch improvements, Laramie Plains, Wyoming.
117. Tabulation, irrigated area classified, Little Laramie Valley, Wyoming.
118. Tabulation, irrigated area classified, Big Laramie Valley, Laramie Plains, Wyoming.
119. Album of Photographs. Improvements under Larimer County Canal, Colorado.
120. Album of Photographs, Improvements under Larimer and Weld Canal, Colorado.
121. Album of Photographs, Agricultural Industries, Poudre Valley.
122. Album of Panoramic Photographs, Wheatland and Laramie Plains areas in Wyoming, and Poudre Valley area in Colorado.
123. Table, discharge, Cache la Poudre River at mouth of canon, 1881-1913.
124. Table, discharge, Cache la Poudre at mouth of canon, showing additions and diversions above gauging station.
125. Table, discharge Laramie River at Glendevey, Colo.
126. Table, discharge Laramie River at Decker's and Boswell's (State line).
127. Table, run-off, Laramie River at Wood's Landing, Wyo., and Skyline and Divide Canal diversions.
128. Table, discharge, Laramie River, Wood's Landing, Wyo., 1889-1913.
129. Table, discharge, Laramie River at Boswell's (State line) and Wood's Landing, showing inflow between stations.
130. Maps of irrigated area, Laramie River Valley in Colorado.
131. Table, discharge, Little Laramie River at Hatton, Wyo.
132. Diagram, Laramie River, Skyline Ditch to Wood's Landing, 1912.
133. Diagram showing flow and use, Little Laramie River, Hatton to Two Rivers, Wyo., 1912.
134. Diagram showing flow and use, Laramie River from Two Rivers to Look Out, Wyo., 1912.
135. Mass diagrams, Wheatland Reservoir, Wyoming, 1912.
136. Mass diagram, supply and use, Big and Little Laramie Rivers, 1912.
137. Mass diagram, supply and diversions, Laramie River, Skyline Canal to Wood's Landing, Wyo., 1913.
138. Diagram, supply and use, Little Laramie River, from Fillmore to Two Rivers, 1913.
139. Diagram, Laramie river, supply and use, Two Rivers to Look Out, Wyo., 1913.
140. Mass diagram, Wheatland Reservoir, Wyoming, 1913.
141. Mass diagram, Big and Little Laramie Rivers, supply and use, 1913.
142. Diagram, flow and diversions, Laramie River to State line.
143. Table, discharge, Big Laramie River at Two Rivers, Wyo., 1909-1913.
144. Table, discharge, Little Laramie River at Two Rivers, 1909-1913.
145. Table, discharge, Laramie River at Uva, Wyoming.
146. Tabulation showing sugar beet industry in Colorado.
147-153. Letters to and replies from State Engineers of various Western States, inter-watershed diversions.
154-155. Soil Maps, U. S. Soil Survey, Laramie Plains, Wyo.
156. Photographs showing snow-fall, Medicine Bow Range, Colorado and Wyoming.
157. Chart, discharge, Little Laramie River at Fillmore, Wyo., 1912.
158. Chart, discharge, Laramie River at Boswell's (State line), 1912.
159-178. Certified copies applications and permits for irrigation projects diverting water from the Laramie River in Wyoming, 1908 and subsequent.
179. Copy, Decree adjudicating priorities, Water District No. 43 (Laramie River, Colorado).

NOTE.—Exhibits 3 to 20, inclusive, consist of various data produced on cross-examination by witnesses for the complainant. These were identified but not introduced.

Exhibits 22 to 50, inclusive, show inter-watershed diversions in India, Italy, France, Canada and United States.

BRIEF IN ANSWER TO THE BRIEF OF THE UNITED STATES.

A DISCUSSION OF THE CONTENTION OF COUNSEL FOR THE UNITED STATES THAT THE WATERS OF THE LARAMIE RIVER ARE THE PROPERTY OF THE UNITED STATES AND WHOLLY REMOVED FROM STATE CONTROL OR THE EFFECT OF LITIGATION BETWEEN WYOMING AND COLORADO.

As we understand the brief of the counsel for the Government, they concede that if the controversy here were between States in which the United States

never owned any property, as, for example, Massachusetts and Connecticut, private rights in an interstate stream would be limited by the division made between the States and either stand or fall with the larger right of the State, upon the theory that the States have rights against each other *in invitum*. To this extent, at least, they agree with the Colorado contention, but they say that the Colorado contention falls to the ground when once it is conceded that the water rights involved come from the United States and are protected by its sovereign power, and the main object of their brief is to prove that water rights in Wyoming and Colorado come from the United States and are protected by its sovereign power, and that the States have no right in or jurisdiction over the waters flowing within their boundaries except to the extent that they may exercise over them and the appropriators the police power which belongs to them as States. If this be true, then if police power is to be given the restricted meaning implied by the argument, counsel are doubtless right in saying that Wyoming has no proprietary or sovereign interests to assert, and Colorado has no proprietary or sovereign interests to defend. Using their own language, "the ungranted waters of the Laramie River, if there are any, are the property of the superior sovereign, the United States, and so are wholly removed from State control or the effect of litigation between the States." Wyoming, therefore, presents no justiciable controversy to this Court. If the appropriators in Wyoming and Colorado derived their rights respectively from the United States and the States have no proprietary or

sovereign interests to protect, it follows that the claims of appropriators in Wyoming against appropriators in Colorado must be settled by separate private controversies and cannot be settled in the mass by any State action.

It is a peculiar quality of rights by appropriation that each right has its own individual history and that there is no common tie between appropriators so far as the initiation and maintenance of their rights are concerned. The State, therefore, could do no more, as *parens patriae,* acting in behalf of appropriators within their limits, than make precisely the proof that they would severally be required to make in their own behalf in private litigation. In other words, any action by the State would be in behalf of a purely private right, and thus in violation of the prohibition applied in such cases.

New Hampshire vs. Louisiana and Others, 108 U. S. 76, 89.
Louisiana vs. Texas, 176 U. S. 1, 16.

Counsel say that by virtue of its acquisition of lands west of the Mississippi the United States has the right to give to individuals a vested interest in waters flowing in innavigable streams, with the right to use and protect it as granted unless and until it is condemned and paid for and that Congress intends that waters thus granted shall be effective regardless of state lines. They make no attempt to solve the problem which the Court desires to have solved if their contention should not be granted. They seek to give a practical as well as a legalistic foundation for their contention by the claim that

otherwise the reclamation projects of the Government cannot be carried out and that the interest of the Government in its lands cannot be preserved unless it has the right to control the disposition of the streams coursing through them.

It is admitted by counsel that Colorado's theory has not as yet offered any obstacle in either case, and it seems also to be admitted that it has been the policy of the Government heretofore to allign itself with other appropriators of water, taking its proper place as an appropriator, and not as a sovereign or proprietary owner, with all other appropriators, senior and junior, just as though it were in every respect bound to conform to the laws of the State, the same as other appropriators. That in respect to the reclamation of its lands, the Government acts in a proprietary and not sovereign way is decided in Twin Falls Land Co. vs. Foote, 192 Fed. 583, Standfield vs. Umatilla River Water Users' Assn., 192 Fed. 596, and in the very recent case of In re Waters of Umatilla River, 168 Pac. 922.

If the Government intends in the carrying out of its reclamation projects or in the use of water on its lands to respect the rights of prior appropriators, it is a matter of no practical importance to it whether the source of title to water by appropriation is the general Government or the State in which the Government plans are carried out or the Government lands may lie. Nor does the existence of the state line have any influence except the possibility of a controversy if water should be stored in one State, to be used in another. But such a contro-

versy is just as possible between the Government and individual appropriators as between the Government and the State. In fact, so far as the Government is concerned in this or in any other controversy concerning the use of the waters of innavigable streams, the contention of counsel is without practical value. It is no more hampered by the laws of the States created out of the public domain in which the doctrine of appropriation prevails than it is in the original States, in which the doctrine of riparian rights prevails, nor is it inconsistent with the interests of the General Government in such streams that the State should have the primary right to make them conserve the general welfare of the State. It seems to us that, so far as the United States is concerned, Mr. Long is quite right in saying that the question of what is the foundation of the right to appropriate is of little practical importance and the discussion thereof largely academic.

But as it is the purpose of this Court to obtain all light possible upon the subject and to formulate some definite rule for the disposition of controversies between States concerning their respective rights in interstate streams, and as Colorado claims that it possesses the sovereign right in its streams, as against the contention of counsel, it becomes our duty to give due consideration to what is advanced upon behalf of the Government.

Is it true that in the States created out of the public domain where irrigation is practiced and where the doctrine of appropriation as opposed to the doctrine of riparian rights prevails, the United States is still the sovereign or proprietary owner

of the natural streams, that all titles by appropriation are derived from it, and that it retains and may exercise plenary control and administration of such streams to the exclusion, if need be, of the particular States in which the streams lie? Is it true that all that has been done by the several States in the enactment of laws concerning the acquisition and use of water and the administration and distribution of the same has been done not in virtue of any inherent sovereign right of the States, but merely by force of the acquiescence of the United States? Is it true that the only inherent power of States in declaring that the waters must be beneficially used and supervising the same to effectuate that purpose, is that power which is denominated the police power? In other words, do the States maintain with respect to their natural streams the relation of mere agents of the General Government, who by the acquiescence of the Government are permitted to provide the machinery for the initiation and maintenance of rights by appropriation and the regulation and control thereof?

As a preface to the discussion of the subject that is to follow, we call attention to the statement of counsel, page 105, that "The question whether the United States or the States own the waters of innavigable streams in the West has never been directly passed upon by this Court." If this be true, the Court will be at liberty to make such disposition of the subject as the present stage of irrigation development and the material interests of the States demand, free from the embarrassment of primitive or obsolete practices or legal conceptions and with-

in the maxim *salus populi suprema lex,* and it will be from that standpoint that we shall finally present our views.

For the present, however, we shall contest the correctness of the statement. We first refer to the case of *Kansas vs. Colorado,* 206 U. S. 46, because that presented a controversy in which it was necessary to say whether the States possessed any sovereign interest in their waters. If the present Government counsel are correct, the waters of the Arkansas River belong to the United States and "are wholly removed from State control or the effect of litigation between the States." It must not be overlooked that the Government was represented by counsel in that case as well as in this, and that the special ground of the Government's interest in that controversy was the protection of its reclamation projects. The Government's contention did not fail because it was not presented or because it was overlooked. The logical conclusion from the argument of the present counsel, which they draw for themselves and which seems correct, is that if the waters belong to the United States the States have no justiciable interest in them as such, but the Court in *Kansas vs. Colorado* found that there was such justiciable controversy, which would imply that they rejected the present contention and that the basis of their decision was the recognition of some rights in the States greater than counsel are now willing to concede. In the opinion in that case the Court inquires whether the question is one simply between States or is a matter subject to National legislative regulation

and is the flow of the stream subject to the superior authority and supervisory control of the United States. The Court puts it thus:

> "In other words, is the determination of the right of the two States *inter sese* in regard to the flow of the waters of the Arkansas River subordinate to a superior right on the part of the National Government to control the whole system of the reclamation of arid lands?"

As to the claims made in behalf of the reclamation projects generally the Court answers that as no power has been granted to engage in such enterprise, none can be exercised. It, however, concedes the authority to reclaim proportioned to the lands still in Government ownership by virtue of the power conferred by the Constitution upon Congress, "to dispose of and make all needful rules and regulations respecting its property." But this is at once qualified by the following statement:

> "We do not mean that its legislation can override State laws in respect to the general subject of reclamation. While arid lands are to be found mainly, if not only, in western and newer States, yet the powers of the National Government within the limits of those States are the same (no greater and no less) than those within the limits of the original thirteen, and it would be strange if in the absence of a definite grant of power the National Government could enter the territory of the States along the Atlantic

and legislate in respect to improving by irrigation or otherwise the lands within their borders."

It then notices the provisions of Section 8 of the Act of June 7, 1902, as indicating the purpose of Congress not to disregard the limitation upon its power and then, as though to foreclose further consideration of the subject, it is said:

> "But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that each State has full jurisdiction over the lands within its borders, including the beds of streams and other waters."

From which the Court concludes, that each State

> "May determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any State."

Following this conclusion, the Court says:

> "May we not consider some appropriation by Colorado of the waters of the Arkansas to the irrigation and reclamation of its arid lands as a reasonable exercise of its sovereignty and not as unreasonably trespassing upon any rights of Kansas?"

The opinion throughout seems to us a definite recognition of a sovereign right in and over the

waters flowing within its boundaries subject to no limitation save such as by the act of union and the terms of the Federal Constitution the Supreme Court of the United States in case of controversy may deem essential to the preservation of the equality of rights between the States.

In *U. S. vs. Hanson,* 167 Fed. 881, Judge Gilbert construes the opinion to be a denial of any power in Congress to interfere with State control which control, subject to the power of Congress to regulate commerce, is vested wholly in the States.

We next refer to the cases of

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, and

Bean vs. Morris, 221 U. S. 485.

In both of these cases the views of the Court, as stated by Mr. Justice Holmes, seem to be irreconcilable with the contentions of the Government counsel. In the latter case, he says:

> "We know no reason to doubt, and we assume that, subject to such rights as the lower States may be decided by this Court to have, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that State. Therefore, subject to the same qualification, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements or such private rights and obligations as are in dis-

pute across their common boundary lines. * * * It follows from what we have said that it is necessary to consider what limits there may be to the powers of an upper State if it should seek to do all it could."

We think it must be conceded that the foregoing gives no support to the theory that the right of appropriation is derived from and depends upon the jurisdiction of the United States, and therefore a right common to both States.

The argument of counsel in the main is based upon inferences which they think may be drawn from decisions relating to the power of Congress to dispose of and make all needful rules and regulations respecting its property and specifically concerning treaties made in connection therewith. Such power being derived from the Constitution, it follows that each State is bound thereby, whether one of the original or one of the newer States, all States being in respect thereto upon an entire equality. It is a power of which the original States made surrender and each State comes into being upon the same terms. But was the delegation to the Federal Government of the power a surrender of anything more? Was it a surrender by the States of the ultimate jurisdiction or sovereignty over the lands which the Government possessed? We understand it is conceded that the moment the Government title passes the proprietary and sovereign right, which the Government theretofore possessed, ceases, and that the land becomes subject without qualification to precisely the status it would occupy if the Gov-

ernment had never appeared in the chain of title, in other words, as though the lands were within one of the original States.

If the argument of counsel is to have any value whatever in this or similar cases, it must clearly demonstrate that, although the Government owns no land in a State created out of the public domain, it nevertheless possesses as a residuum from its original ownership of all the lands in the State, the jurisdiction to originate titles to the use of the water within the State, and, if in its wisdom thought wise, to formulate laws regulating the appropriation and use of water to the exclusion, if need be, of the laws of the State bearing upon the subject. A potent, but not necessarily conclusive, argument against any such view is the fact that Congress has never assumed or asserted any such power. As we have said, the power over the territory or other property of the United States is a granted power, and the question, therefore, is not so much what does the Federal Government possess, but what did the State governments intend to give? Did they surrender jurisdiction and control of those elements of material prosperity without which state development might be arrested and state ambitions defeated? Of this paragraph in the Federal Constitution, Mr. Justice Brewer, in the *Kansas-Colorado* case, *supra,* said:

> "The full scope of this paragraph has never been definitely settled. Primarily, at least, it was a grant of power to the United States of control over its property.

> * * * But, clearly, it does not grant to Congress any legislative control over the States and must, so far as they are concerned, be limited to authority over property belonging to the United States within their limits. * * * The powers affecting the internal affairs of the States not granted to the United States by the Constitution nor prohibited by it to the States, are reserved to the States respectively, and all powers of a national character which are not delegated to the National Government by the Constitution are reserved to the people of the United States."

Now, the function which the Federal Government performs in the acquisition of territory and the creation therefrom of States of the Union, is pretty well discussed and settled by numerous decisions of this Court. While it is true that by the Louisiana Purchase and the several grants from Mexico, the United States became possessed of every shred of proprietary and sovereign title that the most favored nation, under like circumstances, could acquire, it was, nevertheless, never a part of our scheme of government that such conditions should be perpetual. This government of ours is primarily a union of States and the ultimate destination of all territorial acquisitions is the foundation of additional States, to the end that we shall continue as we commenced, as an indestructible union of indestructible States. Therefore, the Federal sovereignty and proprietary title of the United States in its territory is but a passing phase, a mere

preliminary to the time when such territory shall be carved into States. The States when so carved out of the territory of the United States, do not come into the possession of their powers by grant from the Federal Government, but because by the very fact of their existence they possess, in virtue of their definition and our political organization, all the powers, functions and sovereignties of their predecessors in the Union.

It was well said by Mr. Justice Lurton, in *Coyle vs. Oklahoma*, 221 U. S., at page 566, that

> "The definition of a State is found in the powers possessed by the original States which adopted the Constitution, a definition emphasized by the terms employed in all subsequent acts of Congress admitting new States into the Union."

It is this characteristic which, upon the creation of States upon the public domain, negatives the right of the United States to impose, by the enabling act or otherwise, any condition which in the slightest degree destroys this equality with every other State. Whatever may be the terms of the enabling act as to reservations or restrictions upon behalf of the United States, they are effective only to the extent that they could be enforced if not mentioned in the enabling act. In other words, the United States, or the Congress thereof, has no power, by virtue of anything contained in the enabling act, in excess of that which may be exercised in the newly created State after its complete establishment and

which likewise may be exercised if the same conditions were presented in any one or more of the original States.

All of this has been so often and so clearly stated that any elaborate quotation of opinions would be out of place; nevertheless, to preserve the continuity of our argument we shall recall the leading cases.

The first case in point of time was *Pollard's Lessees vs. Hagan*, 3 How. 212, in which, after noting the question presented, the Court said:

> "We now enter into its examination with a just sense of its great importance to all the States of the Union and particularly to the new ones. Although this is the first time we have been called upon to draw the line that separates the sovereignty and jurisdiction of the Government of the Union and the State governments, over the subject in controversy, many of the principles which enter into and form the elements of the question have been settled by previous well considered decisions of this Court, to which we shall have occasion to refer in the course of this investigation. * * * We think a proper examination of this subject will show that the United States never held any municipal sovereignty jurisdiction or right of soil in and to the territory of which Alabama or any of the new States were formed, except for temporary purposes and to execute the trusts created by

the acts of Virginia and Georgia legislatures and the deeds of cession executed by them to the United States and the trust created by the treaty with the French Republic of the 30th of April, 1803, ceding Louisiana" (p. 221).

Then, referring to the ordinance of 1787, which extended to the territory in question, the Court said:

"Taking the legislative acts of the United States and the States of Virginia and Georgia and their deeds of cession to the United States, and giving to each separately and to all jointly a fair interpretation, we must come to the conclusion that it was the intention of the parties to invest the United States with the eminent domain of the country ceded, both national and municipal, for the purposes of temporary government and to hold it in trust for the performance of the stipulations and conditions expressed in the deeds of cession and the legislative acts created with them. * * * When the United States accepted the cession of territory they took upon themselves the trust to hold the municipal eminent domain for the new States and to invest them with it to the same extent in all respects that it was held by the States ceding the territory. * * * Whenever the United States shall have fully executed these trusts, the municipal sovereignty of the new States will be complete throughout their respective borders and they and the

> original States will be upon an equal footing in all respects whatever. We therefore think the United States holds the public lands within the new States by force of the deeds of cession and the statutes connected with them and not by any municipal sovereignty which it may be supposed they possess or have reserved by compact with the new States for that particular purpose. The provision of the constitution above referred to shows that no such power can be exercised by the United States within a State; such a power is not only repugnant to the constitution, but it is inconsistent with the spirit and intention of the deed of cession" (pp. 223-4).

Escanaba Company vs. Chicago, 107 U. S. 678, furnishes another judicial land mark. In that case, Mr. Justice Field said:

> "But the States have full power to regulate within their limits matters of internal police, including in that general designation whatever will promote the peace, comfort, convenience and prosperity of their people. This power enbraces the construction of roads, canals and bridges and the establishment of ferries, and it can generally be exercised more wisely by the States than by a distant authority. They are the first to see the importance of such means of internal communication and are more deeply concerned than others in their wise management" (p. 683).

What was then said by Mr. Justice Field bears with peculiar force upon what we shall hereafter say concerning the wisdom of committing to the arid States respectively all matters relating to the appropriation, use and distribution of water.

Further speaking upon the subject, Mr. Justice Field said:

> "And although the Act of April 18, 1818, Chapter 67, enabling the people of Illinois Territory to form a constitution and State government and the resolution of Congress of December 3, 1818, declaring the admission of the State into the Union, refer to the principles of the ordinance according to which the Constitution was to be formed; its provisions could not control the authority and powers of the State after her admission. Whatever the limitation upon her powers as a Government, whilst in a territorial condition, whether from the ordinance of 1787 or the legislation of Congress, it ceased to have any operative force except as voluntarily adopted by her after she became a State of the Union. On her admission she at once became entitled to and possessed of all the rights of eminent domain and sovereignty which belonged to the original States. She was admitted and could be admitted only on the same footing with them. The language of the resolution admitting her is 'on an equal footing with the original States in all respects whatever.' Equality of constitutional right and power

is a condition of all of the States in the Union, old and new. Illinois, therefore, as was well observed by counsel, could afterwards exercise the same power over rivers within her limits that Delaware exercised over Blackbird Creek and Pennsylvania over the Schuylkill River" (pp. 688-9).

In *Shively vs. Bowlby,* 162 U. S. 1, Mr. Justice Gray, in the course of an exhaustive opinion in which all the previous decisions of the Court are brought into view, says:

"The United States, while they hold the country as a territory having all the powers both of National and municipal government, may grant for appropriate purposes titles or rights in the soil below high water mark of tide waters, but they have never done so by general laws, and unless in some case of international duty or public exigency, have acted upon the policy as most in accordance with the interest of the people and with the object for which the territories were acquired, of leaving the administration and disposition of the sovereign rights in navigable waters and in the soil under them, to the control of the States, respectively, when organized and admitted into the Union. Grants by Congress of portions of the public lands within the territory to settlers thereon, though bordering on or bounded by navigable waters, convey of their own force no title or right below high water mark and do not impair the title and

dominion of the future State when created, but leave the question of the use of the shores by the owners of uplands to the sovereign control of each State, subject only to the rights vested by the Constitution of the United States."

Other cases stating the same conclusions are the following:

Permoli vs. First Municipality, 3 How. 589.
Strader vs. Graham, 10 How. 82.
Cardwell vs. American Bridge Co., 113 U. S. 205.
Hamilton vs. Vicksburg Ry. Co., 119 U. S. 280.
Huse vs. Glover, 119 U. S. 543.
Williamette Iron Bridge Co. vs. Hatch, 125 U. S. 1.

The more recent cases in which this matter is discussed are *Coyle vs. Oklahoma*, 221 U. S. 559, in which Mr. Justice Lurton (p. 567) uses the following language:

"'This Union' was and is a union of States, equal in power, dignity and authority, each competent to exert that residuum of sovereignty not delegated to the United States by the Constitution itself. To maintain otherwise would be to say that the Union through the power of Congress to admit new States might come to be a Union of States unequal in power, as including States whose powers were restricted only by the Constitution when others whose

powers had been further restricted by the Act of Congress accepted as a condition of admission. Thus it would result:

First, that the powers of Congress would not be defined by the Constitution alone, but in respect to new States enlarged or restricted by the conditions imposed upon new States by its own legislation admitting them into the Union, and

Second, that such new States might not exercise all of the powers which had not been delegated by the Constitution, but only such as had not been further broken away as the conditions of admission. * * *

The plain deduction from this case is that when a new State is admitted into the Union it is so admitted with all of the powers of sovereignty and jurisdiction which pertain to the original States and that such powers may not be constitutionally diminished, impaired or shorn away by any conditions, compacts or stipulations embraced in the act under which the new State came into the Union, which would not be valid and effectual if the subject of congressional legislation after admission."

And in the already noticed case of *Kansas vs. Colorado*, in which, as a preliminary to a discussion of the relative rights of Colorado and Kansas to the waters of the Arkansas River, an innavigable stream, Mr. Justice Brewer said:

"But when the States of Kansas and Colorado were admitted into the Union, they were admitted with the full powers of local sovereignty, which belonged to other States, and Colorado, by its legislation, has recognized the right of appropriating the flowing waters to the purposes of irrigation."

And after speaking of the conflict between the laws of the two States, he says:

"Now, the question arises between two States; one recognizing generally the common law rule of riparian rights and the other prescribing the doctrine of public ownership of flowing water. Neither State can legislate for or impose its own policy upon the other. * * * Each may determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriation of waters for the purpose of irrigation shall control. *Congress cannot enforce either rule upon any State.*"

It would seem that what we have already said would be sufficient to dispose of the question, nevertheless it may be contended that we have not yet definitely brought within the principles enunciated, the matter of whether a State, as against the United States, can absolutely exclude the United States from claiming either sovereign or proprietary interests in its waters, or whether the United States can, by act of Congress, legislate concerning the same.

Generally speaking, we understand that the laws of Congress applicable to territories, so far as they concern matters over which the State will have ultimate sovereignty are as temporary as the government title to lands included therein; that is, the rules and principles of territorial government are temporary and subject to be displaced upon the coming in of the State. If, for example, Congress should have given to its lands the common law incident to riparian ownership, the State, in its wisdom, could have displaced that doctrine by the necessary and therefore more appropriate doctrine of appropriation. Or, if the State had deemed the common law doctrine the necessary and appropriate one, it would not be restrained from adopting it by the act of 1866. Such is certainly the logical conclusion to be drawn from the following cases:

In *U. S. vs. Rio Grande Irrigation Company*, 174 U. S. 690, after referring to the common law doctrine of riparian rights, Mr. Justice Brewer said (p. 702):

> "While this is undoubted, and the rule obtains in those States in the Union which have simply adopted the common law, it is also true that as to every stream within its dominion a State may change this common law rule and permit the appropriation of the flowing waters for such purposes as it deems wise."

In *U. S. vs. Cre* 43 U. S. 316, Mr. Justice Pitney says:

> "The States have authority to establish for themselves such rules of property as they may deem expedient with respect to the streams of water within their borders, both navigable and non-navigable, and the ownership of the lands forming their beds and banks, subject, however, in the case of navigable streams, to the paramount authority of Congress to control the navigation so far as may be necessary for the regulation of commerce among the States and with foreign nations; the exercise of this authority being subject, in its turn, to the inhibition of the Fifth Amendment against the taking of private property for public use without just compensation."

In *Hawkins vs. Bleakly*, 243 U. S. 210, Mr. Justice Pitney further says, speaking of what was claimed to be the constitutional guarantee secured to the inhabitants of the State of Iowa by the ordinance of July 13, 1787 (p. 217):

> "It is contended that the guarantees contained in the ordinance were extended to Iowa by the Act of Congress approved June 12, 1838, establishing a territorial government and by the acts for the admission of the State into the Union. This is easily disposed of. The Act of 1838 was no more than a regulation of territory belonging to the United States, subject to repeal like any such regulation, and the Act for admitting the State, so far from perpetuating any particular institution previously established,

admitted it 'on an equal footing with the original States in all respects whatsoever.' The regulation, although embracing provisions of the ordinance declared to be unalterable unless by common consent, had no further force in Iowa after its admission as a State and the adoption of a State Constitution, than other acts of Congress for the government of the territory. All were superseded by the State Constitution."

The cases cited by counsel refute rather than sustain their contention that the Government remains the owner and entitled to dispose of and administer the waters of the arid States. A good deal of confidence seems to be reposed in the decision in *Winter vs. U. S.*, 207 U. S. 564, because it was rendered after the decision in the Kansas-Colorado case. But it will be observed that although the opportunity was presented to recognize the theory now advanced, the Court did not do so, but places its decision upon the basis of a reservation of water for certain lands concerning which the Government had entered into treaty obligations with the Indians. A resort to reservation as the basis of the Government's position in that case was a clear recognition of the fact that except for the reservation, plenary jurisdiction over its waters was vested in Montana upon its admission as a State. Moreover, the reservation was expressed in a treaty which, although entered into with an Indian tribe, nevertheless, as a treaty, possessed the quality of being superior to

the constitution and laws of Montana and of every other State as well.

U. S. Const., Art. 6, § 2.
Hauenstein vs. Lynham, 100 U. S. 483, 490.
U. S. vs. Winans, 198 U. S. 371.

The case of *Gutierres vs. Albuquerque Co.*, 188 U. S. 545, and that of *Boquillas Land & Cattle Co. vs. Curtis*, 213 U. S. 399, are not apposite to the present controversy, the first entitled case having to do with the territorial status of New Mexico, and the second having to do with the rights of a grantee of the State of Sonora to the waters of an arid State.

The only case from which there is any possibility of obtaining support for their theory is *Sturr vs. Beck*, 133 U. S. 541. We have never been impressed by the reasoning of the opinion in that case. The conclusion seems to have been forced and as an authority it should be narrowed to the precise state of facts and the territorial laws of Dakota, and not given any effect as the statement of a universal principle. We think Mr. Justice King was right in saying in *Hough vs. Porter*, 98 Pac. 1083, 1098, that it was overruled by the decision in the *Kansas-Colorado* case.

We conclude that counsel are correct in saying that the question whether the United States or the States own the water of innavigable streams in the West has never been passed upon directly in this Court, if by that statement they mean that they can find no direct support for their theory in anything that this Court has heretofore said. Ownership is hardly the term to use in this connection, since it im-

ports a mere proprietary relation to property. When a part of the territory of the United States is included within a State, the relation of the State to that territory becomes that of a sovereign—a status of paramountcy thereafter prevails antecedent and superior to proprietary right. The sovereign right of dominion which temporarily resided in the United States is assumed by the State, not transferred to it. This sovereign right of dominion over persons and property exists in every State without qualification, except as modified by the universal limitations of the Federal Constitution. Thus, as stated by Mr. Justice Holmes in *Bean vs. Morris, supra:*

> "Subject to such rights as the lower state might be decided *by this court* to have and *to vested private rights, if any, protected by the constitution,* the State of Montana has full legislative power over Sage Creek while it flows within the State."

Mr. Justice Van DeVanter succinctly stated the principle as applied to Colorado in *Snyder vs. Colorado Gold Dredging Co.,* 181 Fed. 62, 65, where he said:

> "In so choosing between these inconsistent doctrines (that is, the doctrine of riparian right vs. the doctrine of appropriation, etc.), Colorado acted within the limits of her authority first as a territory and then as a State, and her choice was recognized and sanctioned by Congress so far as the public lands of the United States were concerned."

We know, of course, that the opinions of the officers of the several departments of the government have no force in this Court beyond their persuasiveness, but the opinions of the Land Department, to whose keeping is committed the disposition of the public lands, may properly be referred to, because they indicate that counsel are now advancing a theory not heretofore entertained in that department.

In the regulations concerning right of way for canals, ditches, etc., under the Act of March 3, 1891, the Department of the Interior said:

> "The control of the flow and use of water is therefore a matter exclusively under State or Territorial control; the matter of administration within the jurisdiction of this Department being limited to the approval of maps carrying the right of way over the public lands."

26 L. D. 520, 524.

And on December 24, 1900, Acting Secretary Ryan reaffirmed the statement in *New Bear Valley Ir. Co. vs. Roberts*, 30 L. D. 382, 386, where he used the following language:

> "The question of the ultimate rights of the parties hereto in and to the waters of said streams under their respective notices of appropriation is solely within the jurisdiction of the state courts and in pursuance with the policy announced in the case of Chicala Water Co. vs. Lytle Creek, the Department will not attempt to interfere

with the control of said waters or determine the rights of the conflicting claimants thereto, except insofar as may be necessary to ascertain whether the applicant has shown such *prima facie* right to the use thereof as will enable him to utilize for the purposes contemplated the grant for which he has applied."

In *Silver Lake P. & I. Co. vs. Los Angeles*, 37 L. D. 152-3, First Assistant Secretary Pierce, on September 9, 1908, stated that:

> "The Department is without jurisdiction to determine the question as to the right to water, that being a matter solely within the province of the state courts."

That Department clearly recognizes the fact that it was dealing with the territory of the United States as the agency of Congress in a proprietary as distinguished from a sovereign sense and with the limitations imposed by the former against the breadth of the latter. That the department was right is evidenced by the opinion of Mr. Justice Van DeVanter in *Utah L. & P. Co. vs. U. S.*, 243 U. S. 389, 410, where he says:

> "Much is said in the briefs about several Congressional enactments providing or recognizing that rights to the use of water in streams running through the public lands and forest reservations may be acquired in accordance with local laws, but these enactments do not require particular mention, for this is not a controversy over water

> rights, but over rights of way through the lands of the United States, which is a different matter and is so treated in the right of way acts before mentioned."

And then he cites *Snyder vs. Colorado Gold Dredging Co.*, 181 Fed. 62, 69, to which we have already called attention.

Section 8 of the National Reclamation Act (Act of June 17, 1902—7 Fed. St. Ann., 1905, p. 1098), clearly limits that act and recognizes the same limitations upon the Government already noted with regard to the Act of 1891. Such was the statement concerning the effect of the act during the debates in Congress and such has been the interpretation thereof by the courts.

> *Con. Record,* Vol. 35, Part 7, pp. 6679-80..
> *Kansas vs. Colorado,* 206 U. S. 46, 92.
> *United States vs. Hanson,* 167 Fed. 881, 884, 93 C. C. A. 371.
> *Twin Falls Canal Co. vs. Foote,* 192 Fed. 583, 594.
> *Bergman vs. Kearney,* 241 Fed. 884, 892-3.

In the last case above cited (*Bergman vs. Kearney*), decided March 3, 1917, by the United States District Court of Nevada, it was contended that all unappropriated waters "belong to the United States Government" (p. 899), the same contention made by counsel in this case, but the argument was treated by the Court as "largely academic, and could lead to no profitable or decisive conclusion," and the unappropriated waters were declared to be the property and under the control of the State (241 Fed. 892-3).

There are some things said by counsel that seem to us quite true; for instance, they say:

> "It is difficult to see how priority of appropriation can be adopted as the rule of decision in this case without taking the federal title as a basis. If we eliminate the rights of the United States and the power of Congress to dispose of those rights and the consideration that the owner of those rights is a sovereign, we have two states facing each other simply as paramount land owners. As such, how can they be confined in their rights in the stream to the water that they have already appropriated, and, as to the surplus waters, be given merely a right to make further appropriations. *The fact that their laws both recognize priority of appropriation as governing the rights of their citizens can have no bearing.* These laws in neither instance were made to govern the State itself as against another State. No rule of comity could apply in a case where the States are seeking to assert rights in *in vitum* against each other. Furthermore, Colorado has lately passed an act designed to retain such waters as she controls within her own borders (Act of March 30, 1917, Session Laws of Colorado 1917, page 539)."

Counsel might have gone much further and said that not only must the federal title be the basis of appropriation, but Congress must supplant all State laws and regulations and give uniformity to all the

laws, rules and regulations respecting the initiation and maintenance of irrigation and other rights, the determination of conflicting claims to water and provide the official force necessary to meet the daily and hourly changes in the flow of the natural streams and the conflicting interests of the various appropriators. The conflicting claims of appropriators in adjoining States from the same stream can never be ascertained, adjudged or regulated so long as each State, or the State called upon to surrender to the demands of the other, refuses to recognize appropriations not made within its borders. It may be said that such a condition of uniformity may be obtained by judicial decree, which would mean that the Federal Court should formulate the rules which should govern. But this would be not only impractical, but in violation of the proper functions of the Court. That Court would be compelled to assume the legislative functions of both Wyoming and Colorado and to become, in effect, an administrative board constantly in session for the purpose of securing to the several appropriators and to the State as well, in respect to the proper utilization of water, the benefits of irrigation.

We fear that some people, and we are sorry to note that this is true of the Government counsel, think that a right of appropriation is an isolated right that when once ascertained, is free from any relation to other appropriation rights. Such is not the case. Each appropriation right, under a highly developed system such as prevails in Colorado, is relative to all other appropriation rights from the same stream, even though they may be, as occurs in

Colorado, 200 miles apart. The principal streams of Colorado, with their tributaries, constitute a single irrigation division in which hundreds of appropriations have been made, and over which the superintending control of the State of Colorado is being daily and hourly exercised for the purpose of securing due observance of the laws of the State and the maintenance of its interests in seeing that the water is beneficially used and that water shall not be taken from the river except when the needs of the land under a particular ditch may require, and that the headgates of the several ditches which are no longer under the private control of the appropriator, but under the control of State officials, shall be closed or opened according to the needs of the appropriator and in accordance with the conditions of supply which may obtain at particular times.

While it is true, paraphrasing the language of Mr. Justice Holmes in *Bean vs. Morris*, that the doctrine of appropriation has prevailed in Wyoming and Colorado probably from the first moment that they knew of any law, and that it was recognized by the statutes of the United States while they were both territories, and that it is recognized by both States now, it does not follow that priority of appropriation is the only attribute of the doctrine. To determine contests between appropriators in different States by that single factor would be to return to the primitive stage of irrigation, when contests over water were purely private contests, relieved of all public concern. But today the science of irrigation, because it has become both a science and an institution, is very little concerned with such primitive notions as who was first in time, as the test of first in right.

We think we are entitled to say that Colorado, because of her extreme arid condition and because, except by the use of her running waters, she must always remain arid, has developed the institution to a point in advance of any other State. But it is to the same degree of finish that other States may be expected to come. So that we are contemplating now, not the mere matter of whether A in Wyoming was prior to B in Colorado, but we are placing the systems of two States in juxta position and in doing so we find that while they are in agreement as to the necessity of irrigating land and to the protection of appropriators, the ways and means and the regulations concerning the subject are far from being identical. The laws of Colorado occupy pages; they determine the conditions under which appropriations may be made, the manner in which they shall be evidenced; they give to the courts special statutory powers to inquire into and determine the rights of the several appropriators; they divide the different water divisions into districts, with a commissioner in each district to keep in daily and hourly touch with the distribution of water, and over the whole system, and as its head and center they place the State Engineer, who is vested with authority to so direct and control the various Division Engineers of each division and Water Commissioners in each water district throughout the entire State of Colorado, that the waters may be at all times beneficially and economically applied in accordance with the several and respective rights of the different appropriators, restrained as they at all times are by the dominant public interest in the wise and proper application of

the water. Wyoming, on her part, has laws either sufficient or tending to be sufficient for the same purpose, but her machinery is different, practically from the first manifestations of a desire to take water up to the moment of its final application. The laws of all the appropriation States differ, and if an appropriator in one State were required to ascertain his rights by reference to the laws of the adjoining States, he would find himself in a state of utter confusion. The test by which to determine the amount of water to which one is entitled, the conditions which would be deemed an abandonment, the procedure in case of shortage, the right to store and the regulation of storage and nearly every incident to the system, have no correspondence in the laws of the various arid States. As is shown by the brief of counsel for the Government, States differ fundamentally, some having mixed conditions, as, for example California, Oregon, Nebraska and probably some others.

We understand that the inquiry of the Court by its recent order is directed to ascertaining not what disposition may be made of the present controversy, but what universal rule should be adopted in case of controversies between States or between appropriators in different States when the laws or the courts of the upper State refuse to recognize or enforce the claims of appropriators in the State or States below. Apparently the time has been reached when it is necessary, quoting the language of Mr. Justice Holmes in *Bean vs. Morris*, to "consider what limits there may be to the powers of an upper State if it should seek to do all that it could." It seems to us that no

rule can be applied, save that which was adopted by Mr. Justice Brewer in the *Kansas-Colorado* case, but the conclusion in that case in our judgment is but a theoretical one, because we cannot conceive that a time will ever arrive when in the wise, judicious and beneficial application of water in Colorado to the reclamation of arid lands and the improvement of the welfare of her citizens, it could be said that Colorado had destroyed the equitable apportionment of benefits between it and a lower State resulting from the flow of a river. Just where the line can ever be drawn it is impossible for us to say, and with all due deference we submit that it is idle to consider it, because there are certain provisions of nature which no human laws can override which serve to maintain an equilibrium of benefits. While Colorado asserts the right to divert all the waters of a stream originating in and flowing through her territory, this is itself but a theoretical assumption, because she does not possess the power to overcome the laws of gravity, nor the direction of moving water in the mass. She may construct dams, she may construct ditches, and she may divert vast volumes of water to the thirsty soil, but when that thirst is appeased the water returns to its former course; and all that has been accomplished by the diversion, as broad and ample as it may be, and the broader the more ample, the more generous the result, she has done nothing but strengthen the flow of the river below the point of use—not strengthened it under flood periods, but strengthened it by equalizing the flow throughout the year.

Let us, in conclu illustrate our contention that there is a law of co..r ion as between States as well as in other r : When the case of *Kansas vs. Colorado* w nstituted, the substantial basis of complaint was there was an underflow underlying the entire . ..sas Valley, which operated beneficially upon surface soil by a form of sub-irrigation. It wa claimed that the diversion of water in Colorado ha: . ered the level of this underflow so that it n onger performed the valuable services theretofore p . med. Since that case was decided, it has been di vered by the advance in electrical science and . improvement in elevating devices that this under is itself as good a supply for the lands in the va of the Arkansas as would have been the surfa ers of the river. The generation of electric the conveyance of the current to the various s permits the pumping of water at no greater exp than is required in the construction of a dite and the diversion of water from a river where the modern perfectness of that method is adopte

OTHER AUTHORITI CITED BY COUNSEL FOR THE D STATES.

Further or ex ed discussion of the cases cited by counsel for United States would serve no useful purpo ... this case. These relate in the main, to the relative e rights of either riparian owners or appropri rs and not to the greater and sovereign rights of States in and to the control of the natural eleme e waters of the streams irrespective of mere p rights. These cases are

largely cited as a basis for the fundamental contention of counsel, that "all the riparian owners on a stream taken together, therefore, may grant such rights in the stream as they see fit. Together they own the entire stream," etc., as a premise to the theory of Government ownership and grant. But in the reasoning of these many cases there nowhere appears or was involved, the fundamental principle that the States in this government of delegated powers have an interest in their streams superior to that of all riparian owners or appropriators and greater than any title or interest which all riparian owners or appropriators combined could convey to a common grantee (*Hudson Water Co. vs. McCarter*, 209 U. S. 349) and the Laramie River or any streams in Iowa, Missouri or other portion of the Louisiana Purchase or any other portion of what was originally the public domain, would appear to be subject to same state control as the streams of New Jersey (*Kansas vs. Colorado*, 206 U. S.; *Marshall Dental Co. vs. Iowa*, 226 U. S. 460; *United States vs. Cress*, 243 U. S. 316).

It is here contended by Wyoming that all the water of the Laramie river has already been appropriated. Under contention of counsel for the United States any discussion of the law of derivation of original title would seem of little value for the reason that, under the theory advanced, these waters have all passed into private hands and like lands gone to patent, are now within the sovereign control of the two states. It is the control of these waters after they have passed into the hands of appropriators that is here involved and the source of the original

title, whether directly from the government by grant according to local laws, customs and decisions of the courts of the respective States as provided by the Act of 1866, or whether by permissive use by the States of one of the great natural and necessary elements of life, is of no moment unless, in fact, if the title be deemed to have been derived by the appropriator directly from the Government, it can then be said that the Government continues to supervise and control the use of the water acquired under the right forever thereafter, irrespective of the laws or necessities of the States. If such be true, control of the waters of the non-navigable streams of Iowa, Illinois or any other public land State must likewise remain perpetually in the United States. Waters of the streams require no particular control or supervision until after appropriation or after riparian, municipal supply or other like rights have attached thereto, except it be for the public protection of the purity of the streams and other like purposes, and academic discussion of the cases cited would be of no ultimate benefit to the court. We however suggest, that nowhere in the brief is there mention of any method, system or machinery by which governmental control could be carried out in a practical manner under, necessarily, one system of laws.

SOME FINAL OBSERVATIONS CONCERNING THE EXTENT OF THE INQUIRY NECESSARY TO BE MADE TO DETERMINE CONTROVERSIES BETWEEN STATES AND BETWEEN RIVAL APPROPRIATORS IN ADJOINING STATES.

Finally, we return to what we said in the opening of this brief to the effect that the matter in hand should be disposed of by reference to the present stage of irrigation development, free from the embarrassment of primitive or obsolete practices or legal conceptions. The question whether the upper State has a full or limited control of the waters flowing through it should be settled definitely and finally. The assaults made upon Colorado by Kansas, Wyoming and Nebraska, successively, not only cloud present titles, but intimidate those desiring to further develop our resources by the more extended use of our waters, and constantly present the problem whether to preserve a supposed equilibrium between Colorado and adjoining States, it may not be necessary to undo something that has been done in Colorado.

With the principle announced in the *Kansas-Colorado* case, upon the basis of which the Supreme Court is enabled to exercise its powers as an interstate tribunal, whenever a substantial reason is presented, we cannot take issue. It is the practical application of the principle that suggests the possibility of injustice. If we consider the particular issue in that case, the unsolved and, as we think, unsolvable, problem was and is: When shall it be said that in the proper and beneficial uses of the waters of the Arkansas River Colorado has reached a point

where the substantial interests of Kansas are injured? And this inquiry, of course, is true of every stream flowing from Colorado into adjoining States. Can the precise point in time or in events be determined? And is it to be ascertained before or after the event? The opinion of Judge Brewer seems to contemplate that the Supreme Court is to act after the point has been passed, which, of course, means that equality is to be produced by a destruction of such development in Colorado as is in excess of what the Court may then fix as the sovereign limit of development. Thus the Court would say to Colorado, your pile is too high, we must sweep a portion of it into Kansas or Wyoming or Nebraska, as the case might be. All of this, in our judgment, denies the further influence in the States concerned of the processes of nature and the genius of man which ought to, and doubtless will, solve problems of this character.

It is true that Colorado and Kansas and Wyoming and Nebraska are States of the Union and amenable to the Constitution which binds them together, but they are at the same time living social and political organisms, entitled to exercise within themselves, respectively, every power and function appropriate to their up-building. And as these powers and functions must operate upon things as well as upon persons, it ought to follow that nothing that has been placed within their physical control should be withdrawn from them, nor should a sword be suspended over their activities, to fall when, in the judgment of the Supreme Court, they should cease. When the people of Colorado assert a right to the

use of all their waters as an attribute of sovereignty, they mean nothing more than that the very nature of a State involves the right to so use its own resources as to advance and contribute to its welfare, and thus to the welfare of the whole country. Is there anyone bold enough to say that the people of Colorado, who have been without government aid in the carrying out of their projects, have not added vastly to the welfare and prosperity of the Union? And with some degree of pride, may we not ask whether there is any one bold enough to say that Colorado has not been in advance of all other States in demonstrating that arid lands may be made fruitful and that the courage and genius of her people have not been of first importance in enabling Congress to dispose of its arid territory? And, yet, if we are to accept the principle of Kansas against Colorado as a living thing, liable to strike at any moment, Colorado and her people must from now on rest under the heavy hand of repression.

So far as the effect upon Colorado is concerned, there is little practical difference between apportioning waters in the mass as suggested in the *Kansas-Colorado* case, or apportioning them by giving to appropriators in Wyoming or any lower State priority over appropriators in Colorado. We are pobably correct in saying that the latter would be the more fatal of the two, because it not only refuses to Colorado the full use of its waters, but it impairs the ability of Colorado to carry to its full fruition the doctrine upon which the use of water in Colorado is founded, namely: That the water belongs to the people and that its use shall at all times be beneficial.

By beneficial is not meant privately beneficial alone, but beneficial from the standpoint of the inital public interest. In Colorado, and we think the same is true of all the arid States, the individual appropriator is but a cog in the machinery or process of irrigation development. He has no independent exclusive right to water, to do with it as he likes, as he may with all other forms of property. On the contrary, he is deemed to be using a public fund, and he must use it to the satisfaction of the public, and he is not left to determine that matter for himself. The State, in the person of its water officials, superintends his taking of water and must be daily satisfied that it is then necessary to his use. If he ceases to use it for an unreasonable time, his right ceases and the water returns to the common fund. He is never free from an obligation to the State and its citizens, as well as to those who are making a like use of the public waters. Thus it is that each State has by law, usage and custom formulated, with more or less claim to completeness, a system of irrigation, the foundation stone of which is necessarily administration. Each State is an administrative unit, in which the success of the system is dependent upon the centralization and unification of jurisdiction and authority in the sovereign power of the people. The rivers in the arid States are fluctuating in volume and usefulness. They may have tidal aspects when the snows of the mountains are alternately melted by the warmth of the day and frozen by the chill of the night. Under these conditions, they rise and fall much after the order of the tides. During some days, and even months, the lower reaches, as was testified in the

Kansas-Colorado case, may not contain upon the surface enough water for a thirsty horse. In the distribution of water for irrigation all contributing supplies, whether by storms or tributary streams, or other temporary causes, must be observed by the water officials and the right to water at the different points of diversion must be daily determined by the river, and even by barometric, conditions then presented. Conservation is the paramount law in the distribution and use of water. Each State devises its own system. Each State is a law unto itself and not unto another, and each State must be unimpeded in the carrying out of its system, else the condition of efficiency, which it is the object of the State to maintain, will be impaired, if not destroyed.

It must be perfectly evident, therefore, that if an appropriator in a lower State may inject his supposed right into that system, he not only takes the water from some one or more of the parties to that system, but impairs the system itself. In other words, he does not strike at an individual appropriator only, but he strikes at the common welfare of the State as endeavored to be promoted by the system. If one appropriator in a lower State may inject himself into the distribution of water in an upper State, a second, a third and an indefinite number may do so, and thus we would have such a series of interpolated claims that the principal duty of the upper State would be to administer its waters in behalf of appropriators in the lower State.

In the *Kansas-Colorado* case, Mr. Justice Brewer said:

> "Now the question arises between two States, one recognizing generally the common law doctrine of riparian rights, the other prescribing the doctrine of public ownership of flowing water. Neither State can legislate for or impose its own policy upon the other."

In the present case, we have to deal with States, in both of which the latter doctrine prevails. This, however, does not negative the fact that the laws of the two States may be different. That they seek a common object does not mean that they adopt a common method. The harmony of the former does not demonstrate the harmony of the latter. All Christian religions are agreed upon the need of salvation, but the most bitter and bloody contests the world has ever known have been over the methods of reaching that desired goal. There is no uniformity in the laws of the several arid States concerning the acquisition, use or administration of water. A cursory examination of the laws of the several States, as set forth in Part 8 of *Weil on Water Rights,* Third Edition, will verify this statement. Not only is there no concurrence of the statutes, but there is a wide variance in judicial opinions, depending to a large degree upon the extent to which the judges are unable to rid themselves of their inherent juridical conceptions of the sacredness of private property. The initiation and history of water rights in Wyoming is different from Colorado. The administration of water in each State is by a different system.

In addition to present variations in the laws of the several arid States it must be borne in mind that still others may occur, as the law, as well as the practice of irrigation and, indeed, of all other uses of water, is still in a state of flux. In no respect has the law or practice settled down to the fixity of the common law doctrine. And let it be remembered in this connection that it took England several centuries to finally and definitely formulate its present doctrine. We must contemplate the possibility that a State may revolutionize its law of waters. New Jersey slumbered along for many years, as time goes in a new country, before it awoke to the fact that back of and superior to the private rights of riparian owners there was a public right that it was entitled to protect. Colorado is not bound to continue its present laws or make them conform to those of Wyoming, nor is Wyoming or Nebraska or Kansas bound to maintain harmony with the laws of Colorado as the basis of a sovereign or individual right to water. Suppose Colorado should conclude to adopt laws similar to Kansas, conceding to riparian owners the right to irrigate, and thus by uses following the course of the stream the water should be exhausted before it passed into Kansas, Nebraska or Wyoming, would these riparian rights be subject to curtailment in the interest of the lower State or other appropriators?

In brief, can this Court, in this or any similar controversy between States, predicate anything upon any actual or supposed concurrence of the laws of the two States? If States assert rights against each other in the waters of interstate

streams, the extent of those rights must be determined by material and physical conditions and by measuring the extent of the resource to which each State is entitled and not by the temporary state of their laws, unless it should be that by their laws they have surrendered something definite. In our judgment, in this as well as in any other controversy which may arise between Wyoming and Colorado, or any other lower State and Colorado, this Court cannot justly apply either the method adopted in the Kansas-Colorado case or the method of recognizing appropriations regardless of state lines. Whatever may be true of the former, because of the fact that *Kansas vs. Colorado* is a precedent, it is, nevertheless, beyond reasonable dispute that to permit an individual appropriator in a lower State to assert and maintain claims against the appropriators in Colorado, would be to destroy and set at naught that system which lays at the foundation of success in irrigation, as well as the success of the United States in the disposition of its territory.

Respectfully submitted,

LESLIE E. HUBBARD,
Attorney General of the State of Colorado.

DELPH E. CARPENTER,
Attorney for The Greeley-Poudre Irrigation District.

JULIUS C. GUNTER,
Attorney for The Laramie-Poudre Reservoirs and Irrigation Co.

PLATT ROGERS,
FRED FARRAR,
RALPH E. C. KERWIN,
Of Counsel.

Introductory statement of contentions of Wyoming and Colorado and position of the United States 1

Effect of these questions upon the public interests and governmental policies of the United States 5

Reclamation policy 5

Indian policy 11

Other Government property rights and activities affected 13

The question of original ownership of innavigable waters fundamental in this controversy 14

Argument 16

Part One. The United States retains its original plenary ownership of the innavigable waters in the Western States, except in so far as it has parted with it through acts of Congress; and this property, like other property in the public lands generally, is wholly immune from State interference or control. The State power affects only those rights which have been granted by Congress 16

I

Upon the acquisition of the territory now comprised within the Western States the United States became vested with all proper rights in that territory, except vested private rights and such Indian rights as the United States might choose to recognize, and also became the full sovereign thereof. There-

Page.

fore, at the time of such acquisition the United States had complete control over the waters of the innavigable streams and the right of use and disposition thereof, and it still has that right unless it has since parted with it in some way 16

II.

The United States is the owner of the public domain, however acquired. It holds that property under its own laws and not under those of the former sovereign. What property the United States owns, whether it owns it as a proprietor or as the possessor of municipal sovereignty, and the incidents and extent of its ownership, are Federal questions determinable by this court according to its own view of the Constitution and of the common law, in the light of which the Constitution is to be interpreted..... 19

III.

Tested by common-law principles the innavigable waters belonged to the sole owner of all the riparian lands—namely, the United States—and could be disposed of, like any other real property, as the owner saw fit 21

(1) At common law, innavigable waters belong to the owners of the land bordering thereon. Water rights were and are still real property. Rights identical with appropriation rights can be created by the owner of all riparian lands on a stream..... 21

(*a*) Water rights are usufructuary rights, and when we speak in this brief of ownership of a stream or its waters, we mean ownership of the right to use them as distinguished from

Page.

ownership of the water itself. The right of use is the substantial property right with which the law has chiefly to deal. Ownership of the corpus of water is of rare occurrence and comparatively unimportant. It does not exist in connection with waters in their natural state.. 21

(*b*) Both at common law and under the appropriation system water rights are real property..... 23

(*c*) At common law, innavigable waters are part and parcel of the riparian land. They belong to the owner of such land as an incident of his estate in the land itself. His title to the water is not dependent upon appropriation or prescription and is derived in the same manner as is his title to the land. Such waters are not *publici juris*..... 25

(*d*) Under the common law, rights identical with appropriation rights can be created. The riparian proprietors taken together are considered as owning the stream. The individual proprietor may grant his land and retain the water, grant the water without the land, or grant both separately. All the landowners on the stream acting jointly, or the sole owner, if there is such, may grant rights in the stream that will be absolute instead of relative, and which may be put to a nonriparian use. City water supplies are examples..... 30

IV.

Water rights now vested in others derive their existence, like titles to land, from the acts of Congress. All interest in water not so granted necessarily remains in the United States. The acts grant nothing to the States, and the mere crea-

Page.

tion of a State could not work a change of this ownership or control 36

(1) The earliest acts of Congress affecting innavigable waters. They show full consciousness of power to deal with such waters on the public lands 36

(2) History and nature of the act of July 26, 1866, granting water and mining rights and rights of way. Purpose and effect of its adoption of local laws and customs 37

(*a*) The occasion of this legislation was the extensive occupation and exploitation of the public lands in the West following the discovery of gold in California. The need was to legalize appropriations of mineral land, rights of way, and water rights already made under local customs and laws and to provide for the future acquisition of rights of the same character in the same manner 37

(*b*) These acts of 1866 and 1870 examined. Their interpretation by the courts 41

(3) Subsequent acts of Congress contradict the theory that the Federal ownership has been abdicated 52

(4) Grants of riparian lands in the pure appropriation States do not carry riparian water rights. The decisions to this effect are in keeping with the act of 1866, the public-land policy of this country preceding that act, the same policy of Mexico, and with the rule of convenience adopted by this court by which the incidents of title taken by grantees of the Government are to be determined by the local law

Page.

in the absence of congressional legislation to the contrary 64

(5) *Hardin* v. *Shedd* and other cases holding that the Government's grantee of lands bordering meandered innavigable waters takes the submerged land or not according to the local law, support the Government's title to both land and water. That the rule is merely one of convenience in interpreting the Government's grant, and that it is competent for Congress to change it, is well settled 72

(6) The claim made by the pure appropriation States, that the States own innavigable waters, was originally an outgrowth of the controversy about the protection of possessory rights before the act of 1866. It is now but an expression of opposition to the Constitutional provision vesting the disposal of the property of the United States in Congress. Arguments for State ownership or control examined 77

(*a*) Ratification of State constitutions asserting State ownership of waters does not divest the United States of its property rights therein. 79

(*b*) The argument based on the necessities of the arid region examined. It wrongly assumes that the riparian system is not suited to western conditions and that, therefore, the States can dispose of the Federal property in water.. 84

(*c*) Water rights being vested rights in real property, the State has the same and no greater control over them than over vested rights in land. The argument that water is *publici juris* is unsound in reason and unsup-

Page.

ported by authority and is advanced merely to support State as against Federal ownership... 93

(*d*) The argument that because navigable waters and their shores and beds go to the States on their admission to the Union in avoidance of State inequality and as one of the royalties of the British Crown, innavigable waters should do likewise, is wholly unfounded. 104

(7) The question whether the United States or the States own the water of innavigable streams in the West has never been directly passed upon by this court. The cases support Federal ownership. Opinions of text writers given and statement in report of Attorney General quoted..... 105

(8) Upholding of State control would disintegrate the law and destroy Federal interests without working any practical good to the States... 126

Part Two. The controversy, as one involving an interstate stream, should be decided upon the basis of the Federal ownership of lands and waters, thereby confining the ownership of the States, as ultimate proprietors, to such water rights as have been or may be granted to the respective States for themselves or for use in connection with the lands within their borders..... 128

(1) Examination of the question of division of waters between States upon the basis of State ownership of innavigable waters and disregarding the Federal title..... 128

(*a*) The proposition that the upper State on a stream may use all of the water regardless of

Page.

the effect of such use upon the flow of the stream in the lower State, is untenable 132

(*b*) A division upon the basis of priority of appropriation illogical under theory of State ownership of water 133

(*c*) A division upon the basis of riparian rights, while logical, would be difficult to work out with justice. Present developments and vested interests could not be protected by a division upon that basis 137

(2) A determination of this and similar controversies on the basis of the Federal title, giving to each State only such water rights as have been granted to it or for use on its lands, would: Protect existing conditions and vested rights, including Federal property and Federal projects; make possible the undertaking of further interstate projects; make litigation between States unnecessary; and would not deny to the States sovereign control over all property rightly subject thereto. Such a settlement would be the most equitable one between States, even if not necessary under the law. 143

(3) Ownership by the superior sovereign, the United States, of all ungranted water, and the Federal origin of all private vested rights in water, necessitate the ignoring of State lines 153

(*a*) State lines can not affect rights acquired before the States were created; therefore, in no event could a division between the States wholly disregard private vested rights 155

(*b*) The sovereignty in the United States is vested in the whole people and not in any subdivision of them, and the control and disposi-

Page.

tion of the property which belongs to the whole people is vested exclusively in Congress 156

(c) To allow State lines to limit the United States, or its grantees, in the use or protection of their water rights would be to deny to Congress the right to control and dispose of the property of the United States. Government grants of water rights are made regardless of State lines 158

(d) Rights granted by the United States to individuals are not included in and do not stand and fall with the rights of the States 162

(e) State equality, jurisdiction, or preservation does not demand that State lines shall control 167

OCTOBER TERM, 1917.

THE STATE OF WYOMING, COMPLAINANT, v. THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, AND THE LARAMIE-POUDRE RESERVOIRS AND IRRIGATION COMPANY.	No. 5, Original. In equity.

BRIEF FOR THE UNITED STATES.

Introductory statement of contentions of Wyoming and Colorado and position of United States.

This brief on behalf of the United States is respectfully submitted in response to the order of this court herein requiring a reargument as to the principles of law that should govern the decision of this cause and directing that copies of the record and briefs be submitted to the Attorney General.

Wyoming seeks an injunction prohibiting a certain specific diversion and use in Colorado of a part of the waters of the Laramie River, an interstate stream. Wyoming seeks to protect rights that it claims for

itself as a sovereign State, and rights that it claims on account of State ownership of riparian lands, and also the individual rights of its citizens. It denies the right of Colorado to permit the waters in question to be taken beyond the watershed. It pleads the case in such a way that it can rely upon the pure doctrine of prior appropriation or upon the riparian doctrine, if the riparian doctrine should be upheld as between individuals or as between two States, or, as we take it, upon any rule of division that this court may decide to be the proper one between States.

Colorado in its answer says that the waters of the Laramie River rise in the mountains of Colorado; denies that they have been fully appropriated; alleges certain priorities in Colorado; and claims that there is ample water for all appropriations so far made in both States. Colorado, however, goes further and asserts that as a sovereign State it not only has a right to assert and urge the claims of its citizens, but that it, in its sovereign capacity, is the ultimate owner of all of the waters within its territorial borders, as one of its natural resources, and may do with them as it will.

Colorado, as we understand it, also takes the position that if two States as against each other have rights *in invitum* in streams that flow through the lands of both, there should be applied the doctrine of a reasonable and equitable sharing by the two States of the benefits in the interstate stream, and that under that doctrine the 91,000 acre-feet of

water that it claims on account of the particular diversion here complained of does not constitute an unreasonable trespass upon Wyoming, because after this diversion is made there would be left a reasonable amount of water in the river for use in Wyoming.

We do not understand that the position of Colorado as above outlined, which was that originally taken, is intended to be changed by its brief on rehearing; but we think it proper to state here that in that brief the proposition that States have rights as against each other in interstate streams which, under some circumstances, would have to be adjusted by this court, seems to be conceded. The principles upon which such a controversy should be decided, other than the broad one of equality between the States as sovereigns, we do not find stated in Colorado's brief; nor have we been able to find there the views of the writers as to what facts should be taken into consideration in determining the amount of water each State would be entitled to or what test ought to be applied to find out whether the use of the stream by one State infringed the rights of the other.

Wyoming, in its brief on rehearing, takes the position, if we understand that brief properly, that priority of appropriation should govern between States as it does between individuals, with the exception that between States the uses ought to be confined to the watershed.

The contention of the Government is that the principles sought to be upheld by both Colorado and

Wyoming, failing as they do, to recognize the proprietary rights of the United States in the waters of innavigable streams upon lands that at one time were all public, and seeking a solution of the problem of interstate streams without taking into account such Federal ownership or the grants of water rights made under the acts of Congress, are unsound in law and opposed to the vital interests of the United States, and, if established, might be fatal to important Government policies and result in an almost inextricable confusion of water rights in such streams. The attitude of the executive branch of the Government, as expressed by the Attorney General in his 1914 report, page 39, is briefly that the United States has not surrendered to the States or lost to them or parted in any way with its original right to use the surplus waters (those not appropriated under its own laws) of innavigable streams in the Western States. Our position is that the United States is and always has been, since the cession of the territories now comprised in those States, the owner of all the unappropriated and surplus waters; that the appropriated waters there have been granted by the United States under its own laws, using local customs and State laws as subordinate instrumentalities only; that the rights of the States, both as the actual owners of lands granted to them and as the ultimate owners of the property of their citizens, so far as they may be said to be such owners, are confined to such water rights as have been granted by the United States to them or their citizens under the laws of Congress; and that

controversies such as this should be decided upon the basis of such Federal grants, and without regard to State boundaries.

The effect of these questions upon the public interests and governmental policies of the United States.

In the Western States, which comprise the arid regions of this country, water for irrigation is of the utmost importance. The United States in that territory is still the owner of more than 505,000,000 acres of land. It is also the owner of over 375,000,000 acres in Alaska. This land is held by the Government for the benefit of the whole people, and the Government is under a moral obligation to guard, reserve, and dispose of it in ways that will best serve the interests of the country at large.

Reclamation policy.

The adoption of the reclamation policy is one of the ways in which Congress has undertaken to discharge that duty. Twenty-seven projects (Annual Report Reclamation Service, 1915–16, pp. 659–661) looking to the reclamation by irrigation of 3,117,862 acres of land have already been undertaken. (Same report and pages.) On these projects $109,885,140 have been expended in dams, canals, and other irrigation works. Of the total irrigable land under these projects, 629,036 acres have been entered by private persons, and the entrymen with their families number over 100,000 persons. (Annual

Report Reclamation Service, 1915–16, p. 20.) The lands in private ownership when the projects were undertaken, which are to be irrigated as a part of the projects, comprise 1,522,168 acres. (Same report, p. 661.) The projects also include in the total land to be irrigated 331,470 acres of Indian lands and 114,620 acres of lands belonging to the States. (Same report and page.)

As to the right of these settlers to the use of the water necessary for the irrigation of their land, even in those instances where the water has already been applied to that purpose, there would be a serious question in case the original title of the Government were not upheld. The Government has not been able to comply with the local laws in all instances, and, furthermore, its right to become an appropriator would very likely be assailed. These private water users might then be unable to show a title to the water they were using based upon properly instituted steps taken to initiate a water right, in which case their rights would date from the time the water was applied to the beneficial use instead of relating back to the commencement of the project. The situation of entrymen where water has not been applied would be precarious indeed. In those cases, if it were held that the Government had not taken the proper steps under the local law, and therefore no rights were initiated, it would be hard to see how the entrymen, having done nothing of themselves except to enter Government land under the project, could claim water rights. Experience has shown that the undertaking

of a Government project, even in the most preliminary way, stimulates private persons and corporations to initiate appropriations from the streams depended upon by the project. Many private projects so started are carried through before the Government works are completed, and in the cases where they are, the right of the entryman on the Government project to water with the priority contemplated depends entirely upon the validity of the Government's initiatory steps. If that should fail, these entrymen would be subordinated in their rights to rights under the private projects, and this, in frequent instances, would result in their not having sufficient or any water for their own lands.

It is possible for the Government as to future activities to control this situation to a certain extent by the withdrawal of vast areas of land when it undertakes a project, thereby, if the situation is such as to enable it to be done, preserving the Government's priority until it can build its works and apply the water to the land. The Government could in this way prevent access to the stream and also prevent the entry of public lands, under the land laws, for private projects. But the effectiveness of this method of obtaining the desired result would not be great and the locking up of the public domain and prevention of settlement and discouragement of private enterprise involved, if this method were the only one that could be resorted to, would be unfortunate.

Many of the projects involve irrigation of land in two States and most of them depend for the water essential to their success upon interstate streams.

The projects now under way or contemplated are often of a character and magnitude that would prohibit their being undertaken by private or even State enterprise. Some of those that are being investigated would be wisely undertaken only if a comprehensive development of a great stream system could be made and lands in several States could be irrigated. Of this character is the proposed utilization of the available waters of the Colorado River. There reservoir sites in Wyoming, Utah, and Colorado would be used to store water for the irrigation not only of lands in those States but also of lands in California and Arizona.

As another example of the dependence of reclamation projects upon interstate streams, we have the North Platte project in Wyoming and Nebraska. Here the lands to be irrigated, amounting to 230,000 acres, are located in the two States. The water supply comes mainly from a third State, Colorado, and is stored in the Pathfinder Reservoir situated in Wyoming.

It is apparent that when projects involve irrigation of lands in more than one State or depend upon waters coming from States other than those containing the lands to be irrigated, or where in any case the waters on which the project relies do not come from one State, the possibilities of conflict between one or more of the States affected and the Federal

Government would be great, if the control of water were wholly a matter of State law and so beyond the power of the general Government.

Hitherto, very serious conflicts have not arisen, or if they have arisen, practically none of them has been pressed to a determination. Identity of interests and the desire of the States to have the Federal Government undertake extensive works and developments within their borders tend to prevent dissensions. The possibilities of conflict, however, remain, and they are becoming more apparent as the stage of initial development in each case gives place to that in which the project is well advanced. When the Government is already committed to the doing of such new work as will be undertaken, and the time arrives when rights between the States and the Government and between individuals and the Government have to be determined, diversity of interests is likely to work to the prejudice of the success of the project. In only a few cases have the water rights upon which the projects depend, and without which they would represent only useless expenditures of public money and a fruitless development of public lands, been adjudicated. When these rights do come to determination in the courts it is inevitable that all private claimants, whose interests in any way conflict with those of the Government, will question its rights, and it is also becoming apparent that the States may do likewise.

Even where a project is wholly within one State, dependence upon State laws for the acquisition of

water rights might be impracticable, if not actually impossible. As to the projects already undertaken, full compliance with such laws has in some instances been impossible. In such cases the water rights of the projects must rest upon the doctrine of Federal rights above stated. The States, in their local laws, have quite generally departed from the original pure doctrine of appropriation. Under that doctrine in its original form, a vested water right could be obtained by putting the water to a beneficial use, without the intervention of any State agency. Now, the State laws commonly provide that no right shall be initiated except by application to and the permission of State officials, who are usually either the State engineer or some sort of board of water control. These laws are also in many instances unsuited to forming or carrying out great projects, as they seldom, if ever, take account of or provide for the interstate character of such projects or the time which it takes to complete them. Commonly, the local laws fix time limits for the completion of work, which limits are too short for Government projects. Also, they in some instances require work to be carried on under the supervision of State officers who have the right, to some extent at least, to determine whether it is progressing satisfactorily or otherwise is being done in compliance with law, and if their determination is adverse, they have the power, by their orders, either to stop the work or to withdraw from its

continuance the sanction of the local law defining the steps necessary to the vesting of a water right.

As to the future, if the theory of States' rights advanced here by Colorado should prevail, the fate of Government projects would depend entirely upon the permission of one or more States. Of necessity these plans must in many instances be opposed in part to the narrow interests of particular States. It follows that in only rare cases could the Government depend upon the cooperation of the State, and, where necessary, upon obtaining State legislation. Even if the States, at the inception of the project, welcomed the Government's undertaking and were willing to aid the project by such legislation as executive officials of the Government suggested, it would probably be unwise for the Government to undertake the project thus dependent upon State action, as the local view of the interests of the State might change. Moreover, in a large undertaking, it is impossible to foresee all contingencies, and no legislation made at the beginning would assuredly suffice for carrying the project to completion and for taking care of its operation for an indefinite period.

Indian policy.

The Government's interests on account of the Indians are likewise vitally bound up in the questions here involved. The Indian reservations in the arid regions comprise 70,891,091 acres. (Report Commissioner Indian Affairs, 1916, p. 90.) And in addition to this the Government will doubtless from time to

time, as heretofore, create new reservations for the Indians and make new allotments of land to individual Indians out of the public domain. In carrying out its policy of advancing the Indians in civilized life by giving them the means of becoming the owners and farmers of irrigated lands the Government has undertaken numerous and extensive Indian reclamation projects, and has undertaken the irrigation of many individual allotments and Indian homesteads. In that work there has already been expended $13,470,354. (Same report, p. 163.)

The waters flowing on these reservations are necessary parts thereof, and without them the land itself would be of small value in accomplishing the purposes for which the reservations were made. The fulfillment of those purposes and the full utilization of the waters needed therefor is of necessity a slow process. For this reason it is to but a limited extent as yet that the waters have been used, or their use so provided for as to give the Indians water rights valid under State laws. Inasmuch as this is so, and as in many cases the reservations were made after the States were created, the water rights essential to those reservations may be in jeopardy if the States, by their creation as such, became the owners or obtained control of the unappropriated waters within their borders. Such a holding would probably not affect many, if it would affect any, of the reservations made before the creation of the States, especially those made by treaty with the Indians (*Winters* v. *United States*, 207 U. S. 564), but it would seriously cripple all reser-

vations made thereafter, and it is probably not too much to say would disastrously affect the Government's Indian policy.

Nothing can be hoped for the Indian by way of favorable legislation from the States. Temporary State interest is almost always opposed to the protection of Indian rights. The Indians during the period of tutelage, which may be indefinitely extended, do not pay taxes, are backward in enriching the State by the creation of wealth therein, and do not take part in political activities. They are, therefore, the prey of individuals and lack the support of those in authority that white men can confidently count upon because of self-interest.

Other Government property rights and activities affected.

Besides the interest of the Government on account of its public lands and the reclamation and Indian policies, it is vitally concerned with the questions here raised because of its policy to prevent monopoly of water power on the forest reserves and on the public domain in general, and on account of its military reservations, its Public Health Service and other hospitals, and, in short, wherever its vast property rights and its multiple activities in the arid region are affected by or depend in whole or in part upon the use of water.

It would be difficult, indeed, for the Government to pursue any of its major policies looking to the de-

velopment of its lands in the Western States, if its use of water should be held dependent upon the permission of the States, and it is hard to see by what theory the Government would be saved from such dependence if the unappropriated waters of innavigable streams are either owned, or are, in any true sense, under the control of the States.

The question of original ownership of innavigable waters fundamental in this controversy.

In the order of this court requiring reargument, counsel are requested to direct their attention to the rule which they deem should properly be applied to a solution of the controversy; that is, first, whether the rights asserted ought to be tested and determined solely by the application of the general principles of prior appropriation without regard to State boundaries, or, second, whether, on the contrary, the general principles of prior appropriation are subject to be restricted or their application limited in this case by State lines, and if so, by what principles under that assumption the case is to be controlled.

Addressing ourselves to that task we assume at the outset the importance of finding, if possible, a rule to govern rights in interstate streams that will not disturb the local systems of water law and administration now in force; and we assume also that it is necessary, if possible, to preserve the large Government interests and important Government poli-

cies that are bound to be affected by whatever rule is laid down.

The question of original ownership of the innavigable waters on the public lands is fundamental. The Government's contention that such ownership is in the United States is the basis of its position that private vested rights in the use of such waters are obtained by grants from the Federal Government; that water rights not so granted are still its property; and that the remaining waters are and have been available to the Government for use in the reclamation of its lands and otherwise, as well as for appropriation by others under the act of July 26, 1866 (14 Stat. 251, 253). The original and present Federal title to such waters offers a solution of the question of interstate streams. That solution is in harmony with the various systems of water law that prevail locally (they having been erected consciously and perhaps in part unconsciously upon that foundation); preserves vested rights in such streams; gives a sure foundation for public and private interstate irrigation projects; and does not interfere with the power of the States over all property within their dominions that is properly subject to their disposition or control.

ARGUMENT.

PART ONE.

The United States retains its original plenary ownership of the innavigable waters in the Western States, except in so far as it has parted with it through acts of Congress; and this property, like the property in the public lands generally, is wholly immune from State interference or control. The State power affects only those rights which have been granted by Congress.

I.

Upon the acquisition of the territory now comprised within the Western States, the United States became vested with all property rights in that territory, except vested private rights and such Indian rights as the United States might choose to recognize, and also became the full sovereign thereof. Therefore, at the time of such acquisition the United States had complete control over the waters of the innavigable streams and the right of use and disposition thereof, and it still has that right unless it has since parted with it in some way.

It has long been definitely settled that from the time when the territory now comprised in the new States was acquired until the creation of those States, the United States, as the owner of the lands and all else capable of ownership therein except property in private ownership (which was of small extent), and

as the possessor of municipal as well as National sovereignty, could dispose of all classes of property rights in such territory. It was the proprietor of the things which under our law are the subject of private ownership and of course could do with them all that a proprietor could do. (*United States* v. *Midwest Oil Co.*, 236 U. S. 459, 474.) It was also the possessor of local, as well as National sovereignty; and so the ownership, control, and disposition of property and rights of every nature, that under our system pertain either to State or National sovereignty, belonged to it.

Shively v. *Bowlby*, 152 U. S. 1.
U. S. v. *Winans*, 198 U. S. 371.
Winters v. *U. S.*, 207 U. S. 564.

This court in the *Winters* case, *supra*, decided in 1908, held, with reference to a reservation by the United States of waters of an innavigable stream in Montana made when that State was a Territory "that the power of the Government to reserve the waters and exempt them from appropriation under the State laws is not denied and could not be" (p. 577). The two authorities cited as supporting this proposition were *U. S.* v. *Rio Grande Dam and Irrigation Co.*, 174 U. S. 690, 702, and the *Winans* case, *supra*. The pertinent doctrine of the *Rio Grande Dam* case is that a State's power to change the common law rule and permit appropriations and so dispose of the waters of the streams within its borders is

limited by its lack of power, "in the absence of specific authority from Congress," to "destroy the right of the United States, as the owner of lands bordering on a stream to the continued flow of its waters; so far at least as may be necessary for the beneficial uses of the Government property."

In the *Winans* case, following the reasoning and authority of *Shively* v. *Bowlby*, *supra*, it was decided that the United States had the power to, and in that instance did, reserve for the benefit of the Yakima Indians in Washington, when that State was a Territory, certain fishing rights and the right to occupy shore lands bordering on navigable waters for fishing purposes free from interference by the grantee and licensee of the State.

The doctrine of the *Winters* case is, therefore, that, whether the waters of innavigable streams, like the lands over which they flow, belong to the United States or whether, like navigable waters and their beds and shores, they belong to the States, the United States owned, controlled, and could dispose of them when the States were Territories.

II.

The United States is the owner of the public domain, however acquired. It holds that property under its own laws and not under those of the former sovereign. What property the United States owns, whether it owns it as a proprietor or as the possessor of municipal sovereignty, and the incidents and extent of its ownership, are Federal questions determinable by this court according to its own view of the Constitution and of the common law, in the light of which the Constitution is to be interpreted.

As was said by this court:

> Every nation acquiring territory, by treaty or otherwise, must hold it subject to the constitution and laws of its own Government, and not according to those of the Government ceding it.
>
> *Pollard's Lessee* v. *Hagan*, 3 How. 212, 225.

The constitutional provision (Art. IV, sec. 3, sub. 2) vesting exclusively in Congress the "power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States," like all parts of the Constitution, "must be read in the light of the common law."

Shick v. *United States*, 195 U. S. 65, 69.

To determine what ownership of its property by the Federal Government means—what incidents and rights are attached to and made a part of that property—we must also turn to the common law as

"the system from which our judicial ideas and the legal definitions are derived" (*Shick* v. *United States, supra*). As said by this court in the case just cited, quoting from *Smith* v. *Alabama*, 124 U. S. 465, 478: "The interpretation of the Constitution of the United States is necessarily influenced by the fact that its provisions are framed in the language of the English common law, and are to be read in the light of its history."

Since the vesting of the full power over the Federal property in Congress "implies an exclusion of all other authority over the property which could interfere with this right or obstruct its exercise" (*Wisconsin Railroad Co.* v. *Price County*, 133 U. S. 496, 504; see also, *United States* v. *Insley*, 130 U. S. 263, 265, and *United States* v. *Nashville Ry. Co.*, 118 U. S. 120, 126), the property rights of the United States and their incidents are not to be affected by State laws or by any power whatever save that of the Federal Government. What these incidents are is a question reserved exclusively for the determination of this court according to its own view of the common law of England, brought to this country by our forefathers as a part of their heritage, and its adaptability to conditions here. It was upon this principle that the question of what constituted navigable waters in this country was decided (*Genesee Chief* v. *Fitzhugh*, 12 How. 443), and that the decision was made that such waters and their shores and beds go to the States as the possessors of municipal sovereignty (*Pollard* v. *Hagan*, 3 How. 212, and *Shively* v. *Bowlby*, 152 U. S. 1).

In deciding questions concerning the property of the United States, State laws and the decisions of State courts are considered by this court only as they throw light upon what the common law is. When the question is, what incidents the Federal grantee takes with the title given him by the Government, State laws and decisions are, in certain instances, followed by this court, but for convenience only.

Hardin v. *Shedd*, 190 U. S. 508.

III.

Tested by common-law principles, the innavigable waters belonged to the sole owner of all the riparian lands—namely, the United States—and could be disposed of, like any other real property, as the owner saw fit.

(1) At common law, innavigable waters belong to the owners of the land bordering thereon. Water rights were and are still real property. Rights identical with appropriation rights can be created by the owner of all riparian lands on a stream.

(a) Water rights are usufructuary rights, and when we speak in this brief of ownership of a stream or its waters, we mean ownership of the right to use them as distinguished from ownership of the water itself. The right of use is the substantial property right with which the law has chiefly to deal. Ownership of the corpus of water is of rare occurrence and comparatively unimportant. It does not exist in connection with waters in their natural state.

Failure to distinguish between ownership of the water itself and ownership of the right to use it has

been the cause of confusion of thought in some of the cases, modern as well as ancient. The right to use water is one of the most substantial property rights known to the law and partakes in no way of the transitory character of the water itself which at any particular time makes up the stream in which the right exists. The law does not in a strict sense regard the water flowing in a stream as being owned by those who have the right to use it, or, in fact, as being owned at all. It does, of course, recognize an ownership in water itself when it is confined and treated as a commodity as when, for example, it is bottled for sale. It is then treated as personal property.

On the other hand, the rights which exist in connection with waters in their natural state—rights in waters flowing in a stream or in water of a pond—are rights of use.

Tyler, v. *Wilkinson*, 4 Mason, 397.
Kent, 3 Comm. (Marg.), p. 439.
Embrey v. *Owen*, 6 Ex. 352, 20 L. J. Ex., 212.
Hargrave v. *Cook*, 108 Cal., 72.

Mr. Wiel, in his learned and exhaustive work on Water Rights, thus states the law in this respect:

> This usufructuary right, or "water right," is the substantial right with regard to flowing waters; is the right which is almost invariably the subject matter over which contracts are made and litigation arises. It is not an ownership in the water itself; it is merely a privilege to use the water, and hence purely incorporeal.
>
> *Wiel, Water Rights*, 3 Ed., p. 755.

When therefore we speak in this brief of ownership of a stream or of the water flowing in it, we do so for brevity merely, and refer not to ownership of the water itself, but of the right to use it.

(b) Both at common law and under the appropriation system water rights are real property.

This is established beyond question; also, that title to water rights is of as high dignity as title to lands. There is no authority to the contrary so far as we have been able to find and no difference in this respect between the common law and the doctrine of appropriation.

That a riparian right under the common law is part and parcel of the land, and, therefore, like the land itself and all that constitutes the owner's estate therein, is real property, see:

Long, Irrigation, 2d ed. (1916), sec. 34, p. 70.

1 Wiel Water Rights, 3d ed. (1911), sec. 711, p. 777 *et seq.*, and numerous cases cited.

Chancellor Kent said, in *Gardner* v. *Newburgh*, 2 Johns. Ch. 162, 166:

> A right to a stream of water is as sacred as a right to the soil over which it flows. It is a part of the freehold of which no man can be disseised "but by lawful judgment of his peers or by due process of law."

It is not an easement.

2 Washburn, Real Property, 6th ed., sec. 1284.

Mr. Washburn, in his work on Easements, 4th ed., pp. 316, 317, says:

> The right of enjoying this flow without disturbance or interruption by any other proprietor is one *jure naturae*, and is an incident of property in the land, not an appurtenance to it, like the right he has to enjoy the soil itself, in its natural state, unaffected by the tortious acts of a neighboring land owner. It is an inseparable incident to the ownership of land, made by an inflexible rule of law an absolute and fixed right, and can only be lost by grant or twenty years adverse possession.

It of course passes only by grant or prescription.

That a water right under the appropriation system is real property, see:

1 Wiel, Water Rights, 3d ed. (1911), sec. 283, p. 298.

2 Kinney, Irrigation, 2d ed. (1912), sec. 769, p. 1328.

In Colorado, the leading appropriation State, the courts say:

> Under our decisions a water right is real estate, not personal property.
>
> *Insurance Co.* v. *Childs*, 25 Colo. 360, 363.
>
> In this state the right to the use of water is deemed real estate, and is a distinct subject of grant, and may be transferred either with or without the land for which it was originally appropriated.
>
> *Davis* v. *Randall*, 44 Colo. 488, 492.

Mr. Wiel says:

> A water right by appropriation is not only real estate, but has all the dignity of and is an estate of fee simple, or a freehold.
>
> *1 Wiel, Water Rights*, 3rd Ed. Sec. 285, p. 301.

(c) At common law, innavigable waters are part and parcel of the riparian land. They belong to the owner of such land as an incident of his estate in the land itself. His title to the water is not dependent upon appropriation or prescription and is derived in the same manner as is his title to the land. Such waters are not publici juris.

General expressions by some of the early writers, in which they fail to make the sharp distinction which the law now makes, and in reality always has made, between ownership of the water itself and ownership of the right to use it, and also the existence of prescriptive rights, for a time left some doubt as to whether the riparian owner's right to use the waters on which his land bordered was not dependent in some way upon actual appropriation.

Whatever doubt existed in that respect was put at rest in England by a series of cases of which *Mason* v. *Hill* (5 Barn. & Adol. 1), decided by Lord Denman in 1833, was perhaps the most important. In this country the question had already been disposed of by Mr. Justice Story in *Tyler* v. *Wilkinson, supra* (4 Mason, 397). Since those cases, it has been settled that under the common law, both in England and in the United States, innavigable waters belong to the owner of the land bordering on them; that the

rights of such owners in the water are in no way dependent upon its use; that the water is part and parcel of the land itself; and that title to it has the same origin as the title to the land.

Baron Parke thus states the law:

> The law as to flowing water is now put on its right footing by a series of cases, beginning with that of *Wright* v. *Howard*, followed by *Mason* v. *Hill*, and ending with that of *Wood* v. *Waud*, and is fully settled in the American Courts: see *3 Kent's Comm.*, Lect. 52, pp. 439–445.
>
> The right to have the stream to flow in its natural state without diminution or alteration is an incident to the property in the land through which it passes; but flowing water is *publici juris*, not in the sense that it is a *bonum vacans*, to which the first occupant may acquire an exclusive right, but that it is public and common in this sense only, that all may reasonably use it who have a right of access to it, that none can have any property in the water itself, except in the particular portion which he may choose to abstract from the stream and take into his possession, and that during the time of his possession only: see *5 B. & Ad.* 24. But each proprietor of the adjacent land has the right to the usufruct of the stream which flows through it.
>
> *Embrey* v. *Owen*, 6 Ex. 352, 368; 20 L. J. Ex. 212.

In *Tyler* v. *Wilkinson* the question was as to the right of a mill owner to use the waters of the River

Pawtucket, at a point where it is innavigable, as against riparian owners. Mr. Justice Story, as Circuit Justice, took occasion to review the law, and in the opinion he rendered briefly covered the whole subject of the origin and nature of riparian rights in nonnavigable waters. The case is the leading one on the subject. Mr. Justice Story said that he had read over all the cases which were cited at the bar, or which were to be found in Mr. Angell's work on watercourses, or which his own auxiliary researches had enabled him to reach. In part the opinion is:

> The natural stream, existing by the bounty of Providence for the benefit of the land through which it flows, is an incident annexed, by operation of law, to the land itself. * * * * * * Mere priority of appropriation of running water, without such consent or grant [of the riparian owners], confers no exclusive right. It is not like the case of mere occupancy, where the first occupant takes by force of his priority of occupancy. That supposes no ownership already existing, and no right to the use already acquired. But our law annexes to the riparian proprietors the right to use in common, as an incident to the land; and whoever seeks to found an exclusive use must establish a rightful appropriation in some manner known and admitted by the law. Now, this may be, either by a grant from all the proprietors, whose interest is affected by the particular appropriation, or by a long, exclusive enjoyment, without interruption, which affords a just presumption of right. By our law, upon

> principles of public convenience, the term of twenty years of exclusive uninterrupted enjoyment has been held a conclusive presumption of a right or grant.
>
> *Tyler* v. *Wilkinson*, 4 Mason, 397, 401.

As to innavigable waters being *publici juris*, the law is equally well settled. The question is disposed of in the passage just cited from *Tyler* v. *Wilkinson*, by placing the ownership of the waters in the owners of the riparian land as "an incident annexed, by operation of law, to the land itself." It is specifically disposed of in the passage we have just quoted from *Embrey* v. *Owen*. Lord Denman, in *Mason* v. *Hill*, considered it fully and came to the conclusion that there was no foundation in the common law, or in the civil law either so far as he could find, for the idea that such waters are open to occupancy, or that they are *publici juris*, except in the sense that no one owns the corpus of the water while it flows in its natural state.

After referring to many expressions in the law to the effect that flowing waters are *publici juris*, and the passage in Blackstone (2 Comm. p. 18): "Water is a movable, wandering thing, and must of necessity continue common by the law of nature; so that I can only have a temporary, transient, usufructuary property therein; wherefore, if a body of water runs out of my pond into another man's, I have no right to reclaim it," Lord Denman says:

> None of these *dicta*, when properly understood with reference to the cases in which they were

cited, and the original authorities in the *Roman* law, from which the position that water is *publici juris* is deduced, ought to be considered as authorities, that the first occupier or first person who chooses to appropriate a natural stream to a useful purpose, has a title against the owner of land below, and may deprive him of the benefit of the natural flow of water.

* * * * *

In the *Digest*, Book 43, tit. 13, in public rivers, whether navigable *or not*, it appears that everyone was forbidden to lower the water or narrow the course of the stream, or in any way to alter it, to the prejudice of those who dwelt near. Tit. 12 distinguishes between public and private rivers; and in Section 4 it is said, that private rivers in no way differ from any other private place.

From these authorities it seems that the *Roman* law considered running water, not as a *bonum vacans*, in which any one might acquire a property, but as public or common, *in this sense only*, that all might drink it, or apply it to the necessary purposes of supporting life; and that no one had any property in the water itself, except in that particular portion, which he might have abstracted from the stream, and of which he had the possession, and during the time of such possession only.

We think that no other interpretation ought to be put upon the passage in *Blackstone*, and that the *dicta* of the learned judges above referred to, in which water is said to be *publici juris*, are not to be understood in any other than this sense; and it appears to us there is no

authority in our law, nor, as far as we know, in the *Roman* law (which, however, is no authority in ours), that the first occupant (though he may be the proprietor of the land above) has any right, by diverting the stream, to deprive the owner of the land below, of the special benefit and advantage of the natural flow of water therein.

Mason v. *Hill*, 5 Barnewall & Adolphus, 1, 23, 24.

For an exhaustive discussion of the subject of our sub-heading and a full citation of English and American authorities, see *1 Wiel, Water Rights*, 3rd Ed. Sec. 670 *et seq.* p. 740 *et seq.*

(d) Under the common law, rights identical with appropriation rights can be created. The riparian proprietors taken together are considered as owning the stream. The individual proprietor may grant his land and retain the water, grant the water without the land, or grant both separately. All the land owners on the stream acting jointly, or the sole owner, if there is such, may grant rights in the stream that will be absolute instead of relative, and which may be put to a non-riparian use. City water supplies are examples.

The essential differences between the riparian and appropriation doctrines viewed as systems of water right tenure are that, while under the riparian system, water rights are relative and may be used only in connection with the riparian lands, under the appropriation system they are absolute and may be used anywhere. Each riparian owner's right is restricted by the fact that all of the other riparian

owners on the stream have exactly the same right. The guiding principle is equality. Under the appropriation system rights are absolute. Each owner has a fixed right to a certain amount of water with a certain priority. His right must be satisfied to the full before those who have rights of later priority take anything. Riparian rights, as against objection by other riparian owners, can be used only on riparian land, while appropriation rights may be put to a nonriparian use.

The kinds of uses that are permitted under the two systems do not differ greatly if at all. Under the appropriation system all uses that are beneficial are allowed; and under the riparian system the water may be used in any way so long as the use does not constitute an encroachment upon the reasonable needs of other riparian owners, who have exactly the same rights. Since exclusion of all but riparian owners from the benefits of the stream (*Wiel, Water Rights*, p. 862, *et seq.*) and equality between riparian owners are guiding principles of the riparian doctrine, all uses that are reasonable, under the circumstances of the case, must be permitted. Any other rule would deprive the riparian proprietors, as the virtual owners of the stream, of the opportunity to make full use of its benefits. "Streams of water," says Kent (3 Comm. 429) "are intended for the use and comfort of man, and it would be unreasonable and contrary to the universal sense of mankind to debar every riparian proprietor from the application of water to domestic, agricul-

tural and manufacturing purposes." The extent and nature of permitted uses depends upon maintaining a fair balance between the several owners and upon local needs and the circumstances of the case. So, in an arid region where farming by irrigation is of paramount importance, as in California, it would be entirely consistent with the principles upon which the doctrine of riparian rights is founded to permit the whole stream to be diverted for irrigation in proper cases. In such a case each riparian owner would, of course, get his fair share of the water. On the other hand, in a humid region where other uses are of more importance and irrigation comparatively unnecessary, the riparian owner's right to irrigate might be greatly restricted. That irrigation is one of the uses recognized by the common law, though questioned in some of the cases in the pure appropriation States, we think is well settled. The New Jersey court in a late case says:

> That diversion for use upon riparian land and for domestic and agricultural or manufacturing purposes is in its nature a reasonable use is the settled law of this state, and diversion for irrigation has been held to be a reasonable use in accordance with the general American doctrine and the English authority.
>
> *City of Paterson* v. *East Jersey Co.*, 74 N. J. Eq. 49.

See Mr. Wiel's full discussion of this subject and citation of authorities. (1 *Wiel, Water Rights*, 3d Ed. Sec. 749a, p. 817 *et seq.*)

Under the common law, an innavigable body of water taken as a whole is considered as being the property of the riparian owners. Streams and ponds are spoken of as "private" (*Genesee Chief* v. *Fitzhugh*, 12 How. 442, 445) and as being "owned" (*Hardin* v. *Shedd*, 190 U. S. 508, 519) by the owners of the land over which they flow. All the riparian owners on a stream taken together, therefore, may grant such rights in the stream as they see fit. Together they own the entire stream. The whole estate is theirs and they may divide it up or grant it as they like. A sole owner of all the riparian land, of course, has the same privilege.

> 1 *Wiel, Water Rights*, 3d Ed. Sec. 864, last par. p. 904 and note.

Even if one is not the sole owner, he may divide his own estate as he will. He may separate his water right from his land, grant the land and reserve the water right, or grant each separately. (*Goodrich* v. *Burbank*, 12 Allen, 459, 461; *Lonsdale* v. *Moier*, 15 Fed. Cas. No. 8496, p. 836; *Rood* v. *Johnson*, 26 Vt. 64, 71). He may do this as freely as the land owner can subdivide his estate or grant the minerals separately. Of course, he can only give to his grantee what he himself has, and his rights being relative and confined to use in connection with riparian land as against the other riparian proprietors who are co-owners with him of the whole stream, he can not, if they object, grant a water right which will be absolute or one that may be used on non-

riparian land. Even a grant of that kind, however, is valid against himself.

1 *Wiel, Water Rights*, 3rd Ed. Secs. 845, 846, p, 901 *et seq.*

City water rights in the riparian States are obtained in the way just indicated; so, also, rights for any non-riparian use. The city or the irrigation district or the private land owner who wishes to take a certain quantity of water from a stream and carry it away from the riparian lands and use it there must obtain a grant either voluntary or involuntary from all the riparian owners. If only one riparian owner is left outstanding, the acquired rights are defective to that extent. If, however, all are brought in, the non-riparian use is fully legalized and the right to the quantity of water granted is absolute.

Under the common law, therefore, the United States, as the owner of the public lands out of which the Western States were subsequently created and so the owner of all of the lands in that whole vast territory, with the exception of the few Spanish and Mexican grants, was the owner of the innavigable streams and ponds therein and could, in strict compliance with law and as a mere proprietor, convey water rights such as now exist in the appropriation States and such as exist in the dual system States, as well as ordinary riparian rights such as obtain in those of the public land States which hold fast to the pure riparian doctrine. That that is what,

in fact, the United States did, and that all of these systems rest squarely upon the original Federal title, it is our purpose to show.

Appropriation water rights are not new in character. The only thing in connection with them that is unusual is the freedom of their acquisition. Under the policy adopted by Congress the waters on the public lands, like the lands themselves and the minerals in them, have been thrown open to private acquisition under the laws that Congress has thought best suited to accomplish its purposes. The common law is the basis of it all, and every step has been taken, for the most part consciously, in strict accordance with its principles.

> Where all the riparian rights on a stream are dealt with together in one contract, a right similar in result to a public-land appropriation may arise, since all who could complain have contracted away their rights. A severance of riparian rights by a sole riparian proprietor hence is a close counterpart of a public-land appropriation. An "appropriation" is, on the other hand, under the California doctrine, a grant of water on public land from the United States so far as it was in pioneer days a sole riparian proprietor.
>
> 1 *Wiel, Water Rights,* 3d Ed., p. 904.

25895—17——4

IV.

Water rights now vested in others derive their existence, like titles to land, from the acts of Congress. All interest in water not so granted necessarily remains in the United States. The acts grant nothing to the States, and the mere creation of a State could not work a change of this ownership or control.

(1) The earliest acts of Congress affecting innavigable waters—They show full consciousness of power to deal with such waters on the public lands.

Section 2476 of the Revised Statutes provides:

> All navigable rivers within the territory occupied by the public lands shall remain and be deemed public highways; and in all cases where the opposite banks of any stream not navigable belong to different persons the stream and the bed thereof shall become common to both.

This section is but a continuation of early statutes on the subject (acts of May 18, 1796, 1 Stat. 468; March 3, 1803, § 17, 2 Stat. 235; Feb. 20, 1811, § 3, 2 Stat. 642; and March 3, 1811, § 12, 2 Stat. 666), and is referred to in *Railroad Co.* v. *Shurmeir*, 7 Wall. 272, 289; *Scott* v. *Lattig*, 227 U. S. 229, 242; and *Hardin* v. *Shedd*, 190 U. S. 508, 519.

These acts show that from the earliest times Congress has had clearly in mind the difference that exists in the relation of the Federal Government to navigable and innavigable waters. They likewise show that Congress has been fully conscious of

ownership in the United States of the innavigable waters on the public lands and of its own power to say how these waters shall be disposed of.

Those of the acts preceding R. S. 2476, which affected lands beyond the Northwest Territory (acts of February 20, 1811, and March 3, 1811), omitted the above clause referring to innavigable waters. Since the passage of the act of July 26, 1866, which we shall now discuss, the disposition of such waters on the public lands has been controlled by this latter act and by the local laws and customs used as its subordinate instrumentalities.

(2) History and nature of the act of July 26, 1866, granting water and mining rights and rights of way. Purpose and effect of its adoption of local laws and customs.

(a) The occasion of this legislation was the extensive occupation and exploitation of the public lands in the West following the discovery of gold in California. The need was to legalize appropriations of mineral land, rights of way, and water rights already made under local customs and laws, and to provide for the future acquisition of rights of the same character in the same manner.

The occasion and history of this legislation, with specific reference to water rights and water ways, are sufficiently shown by the opinions in—

Jennison v. Kirk, 98 U. S. 453.
Atchison v. Peterson, 20 Wall. 507.
Basey v. Gallagher, Id. 670.
Broder v. Water Co., 101 U. S. 274.

See also—

1 *Wiel on Water Rights,* 3d Ed., Secs. 66 *et seq.*, 92 *et seq.*

1 *Kinney on Irrigation and Water Rights,* 2d Ed., secs. 596 *et seq.*, 611 *et seq.*, 636 *et seq.*

Almost immediately upon the discovery of gold in 1848 a large population sprang up in California and Nevada and the other western territories. Mining, milling, agriculture, and other industries quickly grew to great importance and large communities dependent upon these activities of the miners and settlers, were established. The country thus so suddenly occupied was up to that time a vacant wilderness, most of which had been but lately acquired from Mexico. There was no general mining law, the lands were unsurveyed and there was no efficient statute under which the Government title to land of any character could be acquired. (*Wiel, Water Rights,* 3d Ed. p. 92).

The miners and settlers and the residents of the towns were alike technical trespassers on the lands of the United States. They took out the gold, set up mills for the reduction of ores, cut the timber, and engaged in agriculture. For all of these purposes the use of water was essential, and they diverted it from the streams. All this was done under orderly and firmly established codes of rules made by the miners' meetings in the various communities, the decisions of courts, and later by State and Territorial legislation. The law that thus grew up was purely a law of possessory rights made to regu-

late the acquisition and holding of the Government property by the miners and settlers among themselves and as against each other. It was all subject to the underlying rights and, at that time, unexercised powers of the United States as the owner of the property affected. As to mineral land, the vein or lode was recognized as the thing discovered, and the thing of value; and so the rules gave title to that rather than to so much land and allowed the following of the vein on its dip even though doing so involved going outside of the limits of the surface claim extending vertically downward. As to water, the lands from which it was taken, the lands occupied by the ditches and flumes, and the lands where it was used, whether for milling ores, washing the gold out of the gravel of the hillsides and stream beds, or for irrigation, were all until such occupancy vacant public lands.

If the miner or farmer felt free to appropriate the vein of mineral that he had discovered or the land that he wanted to farm, he felt equally free to take water for those purposes from the most convenient source. The fact that he thereby took the waters from another piece of Government land bordering on the stream made no difference under the circumstances. He could take that land, too, if he wanted it. The rules, therefore, permitted the diversion of water for any useful purpose and recognized the first appropriator's priority of right just as they recognized the priority of the discoverer and first claimant of a vein of mineral. Throughout this period, during

which these possessory rights had come to be of enormous value and had finally been held by the courts to have, between the appropriators, practically all the dignity of freeholds (1 *Wiel, Water Rights*, Secs. 89 and 90, p. 97 *et seq.* and cases cited), it was realized that the underlying legal title was outstanding. The courts in the cases involving these rights were careful to refer to the paramount Government title. They usually did so by saying that the rights on which they were passing were good "except as against the United States." (*Wiel, Water Rights*, Sec. 91 p. 102 and cases cited; *Atchison* v. *Peterson*, 20 Wall. 507, 510; *Basey* v. *Gallagher*, 20 Wall. 670, 681; and *Sturr* v. *Beck*, 133 U. S. 541, 552).

The uppermost question in everyone's mind was what Congress would do and what effect whatever action Congress might take would have upon these rights. When Congress provided a means for the acquisition of the Government title, would the Government grant of mineral land cut off the right of the miner whose vein ran under that land from following it and abstracting the minerals? Would a grant of land, over which a ditch or flume or road ran, except a right of way for the benefit of the original builder and present occupier, and would a grant of riparian land or of all the riparian land on a stream carry with it the right to stop the use of water by appropriators who had taken it, often to a great distance, and put it to nonriparian uses? To meet this situation the act of 1866 and the supplementary act of 1870 were passed.

Congress had already provided adequate means for the acquisition of the Government title to agricultural lands by passing the homestead act in 1862.

(b) These acts of 1866 and 1870 examined—their interpretation by the courts.

The relation of these two acts to water rights and water ways was precisely the same as their relation to the mineral lands. The first act, July 26, 1866 (14 Stat. 251), was styled merely, "An act granting the right of way to ditch and canal owners over the public lands, and for other purposes;" but it was in reality the first general mining law of the United States. Its first section declared that "the mineral lands *of the public domain*" should be free and open to exploration and occupation by citizens, etc., subject to such regulations as may be prescribed by law and subject also to the local customs or rules of miners in the several mining districts, *so far as the same may not be in conflict with the laws of the United States.*

Sections 2 to 4 provided for the locating, entering, and patenting of lode claims occupied and improved "according to the local custom or rules of miners" in the mining district "so extended laterally or otherwise as to conform to the local laws, customs, and rules of miners," giving them the right to follow the vein or lode to any depth "although it may enter the land adjoining, which land shall be held subject to this condition" (sec. 2), authorizing

the Surveyor General to vary the form from rectangular "to suit the circumstances of the country and the local rules, laws, and customs of miners," with a proviso that no location should exceed a certain length for each locator (sec. 4).

Section 5 provided:

> That as a further condition of sale, *in the absence of necessary legislation by Congress*, the local legislature of any State or Territory may provide rules for working mines involving easements, drainage, and other necessary means to their complete development; and those conditions shall be fully expressed in the patent.

Section 8:

> That the right of way for the construction of highways over public lands, *not reserved for public uses*, is hereby granted.

In section 9 we find substantially and almost in words R. S. section 2339. It was as follows:

> That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purpose aforesaid is hereby acknowledged and confirmed: *Provided, however*, That whenever, after the passage of this act, any person or persons shall, in the con-

> struction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Section 10 allowed settlers on nonmineral lands, which had been excluded from survey as mineral, to acquire them under the preemption and homestead laws.

The act of July 9, 1870 (16 Stat., 217), amended the act of 1866 by adding six new sections numbered 12 to 17, inclusive. Section 12 extended the law, with certain modifications, to placer claims. Section 13 provided that where claims had been held and worked "for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated", the right to patent should be deemed established. Sections 14 to 16 dealt with land office procedure, fees, and surveys. Finally, section 17, which has been modified into R. S. section 2340, *supra*, declared:

> That none of the rights conferred by sections five, eight and nine of the act to which this act is amendatory shall be abrogated by this act, and the same are hereby extended to all *public lands* affected by this act; and all patents granted, or preemption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, *as may have been acquired under* or recognized by the ninth section of the act of which this act is amendatory.

The sections 5, 8, and 9 here referred to are the section allowing local legislatures, in the absence of legislation by Congress, to provide rules "for working mines involving easements, drainage, and other necessary means to their complete development," the section granting rights of way over public lands for highways, and the section concerning water rights and ditches. (R. S. 2339.)

The mining features of this act were crude and were repealed and their place taken by the more detailed act of May 10, 1872. (17 Stat. 91.)

In this latter act, however, the policy adopted by the former of favoring local laws and granting mining rights in accordance therewith is adhered to. The water features of the original acts have been preserved and are still in force.

That the act of 1866 provides a means for the future acquisition of rights, water as well as mining, is the settled holding of the courts. That it looks to the future as well as the past is made perfectly clear by the act of 1870 through the use of the words: "Such water rights * * * as may have been *acquired under* or recognized by the ninth section of the act of which this is amendatory." Two classes of rights are under consideration and provided for; rights existing prior to the passage of the act and rights acquired afterwards and so under the express authority of the act itself.

Jacob v. *Lorenz*, 98 Calif. 332, 335.
Beaver Brook v. *St. Vrain*, 6 Colo. App. 130, 138.
1 Wiel, Water Rights, 3d Ed., Sec. 99, p. 116.
Long, Irrigation, 2nd Ed. Sec. 74, p. 134.

Without unduly extending this analysis or resorting to too extensive citations of authority, we wish to invite still further attention to certain of the salient features of this legislation and its interpretation, as it is, in our view, the foundation of all water rights in the Western States to-day and provides a solution and, we think, the only solution of the problem of interstate streams.

It will be seen that this act of 1866, while treating principally of mining, governs also water rights and rights of way for ditches, canals, and highways. These several subjects are handled together and in the same way. As to each the act gives the fundamental title to those who already had possessory rights, and provides a way by which grants of mining and water rights may be obtained in the future. Mineral lands are held open to "exploration and occupation", and he who occupies is given the right to take the other steps which lead to a grant. Water rights are "protected and preserved" to whomever has "possessed" them. Local laws, rules, and customs are used in both cases to define the right and provide the course that must be followed to acquire it. The mineralized vein is recognized by the act, as it was before by the customs of the miners, as being the thing appropriated, and so the right is given to follow it regardless of the surface limits of the claim extending vertically downward, which ordinarily define the extent of land holdings. In the field of water rights, again in accordance with local customs, the one who first "appropriates,"

even for use on nonriparian lands, is given the better right. Both as to mining and water, however, the rights granted are only such as any proprietor of the whole property involved could grant, and the rule of priority is only that which necessarily follows from successive conveyances of defined parts of a whole.

Further, it should be observed that under this act the proprietor, the United States, in a way holds its landed estate for conveyance in three classes—mineral rights, water rights, and what may be called, for convenience, ordinary land rights. It holds all of these rights for conveyance separately or together, as the case may be. Consequently, riparian rights pass or not under a patent of riparian land, generally speaking, according to whether or not the riparian doctrine or the appropriation doctrine is the rule in the locality where the land is situated. Congress has provided that it shall be otherwise in the Black Hills Forest Reserve in South Dakota (34 Stat. 233, 234). As to this point, we shall speak more in detail when we come to consider the Mexican grants and the cases, holding that in the pure appropriation States the Government's patent does not carry riparian rights.

It is well understood that the local rules, whether found in miners' customs, court decisions, or legislative acts, were adopted merely to supplement the particular provisions and fundamental conditions of the act, in order to fit it to local conditions, including local preferences, and avoid unnecessary complexity and volume in the act itself. This plan of adopting

local laws or rules as the laws and rules of Congress is familiar enough. It is seen in the legislation defining crimes on reservations under exclusive jurisdiction of the General Government; in the conformity provisions governing the Federal courts in common-law cases; in various laws for the taking of affidavits, etc. Illustrations might be greatly multiplied.

As we have already said, the local laws, customs, etc., in respect of mining claims, retain their function under the mining law as it is to-day. They depend, of course, upon the express permission of Congress therein contained.

> State statutes in reference to mining rights upon the public domain must, therefore, be construed in subordination to the laws of Congress, as they are more in the nature of regulations under these laws than independent legislation.
>
> *Lindley on Mines* (2d ed.), sec. 249.

Quoted with approval in *Butte City Water Co.* v. *Baker*, 196 U. S. 125.

Their constitutionality, challenged in the case last cited, was upheld upon the ground that a delegation of authority to adopt "minor and subordinate regulations" concerning the disposition of the public domain is not a delegation of strictly legislative power. See also *Clason* v. *Matko*, 223 U. S. 646, 654.

It is somewhat astonishing to find the *Broder* case (101 U. S. 274) and *Jennison* v. *Kirk* (98 U. S. 453, 456) cited in Colorado's brief as authority for the

idea that the act of 1866 recognized an independent title or power in the States. They hold exactly the reverse.

The act is a grant of rights belonging to the United States. This Court in *Broder* v. *Water Co.*, *supra*, 101 U. S. 274, 275, construing the right of way part of the ninth section of the act says that the same is an "unequivocal grant." The Circuit Court for the District of Nevada in *Union Co.* v. *Ferris*, 2 Sawy. 176, 184, held:

> The policy of this enactment (sec. 9, act of 1866), so far at least as it relates to agricultural districts, may be doubtful; but it is the law of the land, and the courts must carry out what appears to be the intention of the legislature (Congress) as therein expressed. And that, as indicated by the act, appears to be to grant to the owner of possessory rights to use the water under local customs, laws, and decisions, the absolute right to such use, which the Government alone could grant.

The text writers so construe it. (See: *1 Wiel, Water Rights*, 3d Ed. Sec. 97, p. 113; Sec. 155, p. 177 *et seq.*; *Long, Irrigation*, 2d Ed., Sec. 74, p. 134.)

The grant is made directly to the individual appropriator. It takes effect upon his bringing himself within its terms by complying with the local laws. No patent follows as in the case of mining claims, but the title passes by virtue of the statute itself and compliance with it, as is the case with railroad grants and grants of rights of way.

> The language of this act (act of 1866) makes the right a confirmation *in praesenti* as to the

> claims included (referring to water rights), without any preliminary proceeding to obtain a title, as in the case of a mining claim. A grant conferred by an act of Congress is the highest source of title known to our laws.
>
> *Yale, Mining and Water Rights*, p. 380.

The law of water rights in California and the numerous States which have followed her lead is based squarely upon the Federal title. These States are California, Kansas, Montana, North Dakota, South Dakota, Washington, Nebraska, Oregon, and possibly Oklahoma. (1 *Wiel, Water Rights*, 3rd Ed., p. 226.) Appropriation rights in those States are explicitly held to be derived from the United States by direct grant under this act. Riparian rights, which there exist side by side with rights by appropriation, are held by the courts to be derived from the United States under grants by it of riparian lands.

> It has never been held that the right to appropriate waters on the public lands of the United States was derived directly from the State of California as the owner of innavigable streams and their beds. And since the act of Congress (1866) granting or recognizing a property in the waters actually diverted and usefully applied on the public lands of the United States, such rights have always been claimed to be deraigned by private persons under the act of Congress, from the recognition accorded by the act, or from the acquiescence of the general government in

previous appropriations made with its presumed sanction and approval.

Lux v. *Haggin*, 69 Cal. 255, 339.

An appropriator of water under these circumstances, and while the land which he subjects to his necessary uses continues to be a part of the public domain, is a licensee of the general government; but when such a part of the public domain passes into private ownership, it is burdened by the easement granted by the United States to the appropriator, who holds his (water) rights against this land under an express grant.

Smith v. *Hawkins*, 110 Cal. 122, 125.

The Supreme Court of Washington, referring to this act, said:

It was for the purpose of protecting the rights of appropriators of water for beneficial uses on the public lands which had vested and accrued, by virtue of local customs, laws, and decisions of the courts, that the ninth section of the act of Congress of July 26, 1866, the substance of which is included in section 2339 of the Revised Statutes, was enacted. It was apparent to Congress, and, indeed, to every one, that neither local customs nor State laws or decisions of State courts could vest the title to public land or water in private individuals without the sanction of the owner, viz., the United States.

Benton v. *Johncox*, 17 Wash. 277.

In Oregon it is held that "an appropriation of water is a grant by the General Government to the

settler of the right to its use." *Morgan* v. *Shaw*, 47 Oreg., 333, 337.

> A water right can, therefore, be acquired only by the grant, express or implied, of the owner of the land and water. The right acquired by appropriation and use of the water on the public domain is founded in grant from the United States Government as the owner of the land and water. Such grant has been made by Congress.
>
> *Smith* v. *Denniff*, 24 Mont., 20, 21.

See also *Barkley* v. *Tieleke*, 2 Mont., 59, 64.

To the same effect see:

> *Cruse* v. *McCauley*, 96 Fed. 369, 373–374.
> *Howell* v. *Johnson*, 89 Fed. 556, 558.

Colorado and the other pure appropriation States, and the Territory of Alaska (Alaska, Arizona, Colorado, Idaho, New Mexico, Nevada, Utah, and Wyoming; 1 Wiel, Water Rights, 3d ed., p. 226), endeavor to find some basis for water rights other than the Federal title. The arguments advanced for their position we shall examine under a different head. In those States water rights are identical with appropriation rights in California and the other dual system States, and, of course, are derived, as they are there, from the United States by grants under this act, unless indeed the effectiveness of that legislation, so far as it covers water, came to an end upon the admission of the States, a proposition which it is in part the purpose of this brief to refute.

25395—17——5

(3) Subsequent acts of Congress contradict the theory that the Federal ownership has been abdicated.

Since the act of 1866 there are a number of statutes reiterating the policy of Congress to permit the appropriation of water and leave it largely within the control of the local regulations. These laws do not bear out the assertion that the Federal interest in nonnavigable water has been transferred to the States, and still less do they lend support to the theory advanced in Colorado's brief that Congress recognizes the States as having any ownership of or control over such water independent of a transfer from the Federal Government.

It is to be noticed that in these later declarations by Congress concerning water there is evident not only a consciousness of the power to deal with this subject without State intervention, but in some instances an actual exercise of the power itself. It is as impossible to gather from these acts that Congress intended by them to divest the United States of its interest in water as it is to obtain the impression that Congress in legislating believed it was without power in the matter. All of these acts merely adhere to the general principle of the act of 1866 as one of convenience. They favor the laws of the Territories quite as much as those of the States and in some instances they give rules independent of either. On this subject see the discussion and citations in *Kinney on Irrigation and Water Rights* (2d ed.) Sec. 637.

The desert-land law of March 3, 1877 (19 Stat. 377), contains this proviso:

> *Provided, however*, That the right to the use of water by the person so conducting the same, on or to any tract of desert land of six hundred and forty acres shall depend upon bona fide prior appropriation; and such right shall not exceed the amount of water actually appropriated and necessarily used for the purpose of irrigation and reclamation; and all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers and other sources of water supply upon the public lands and not navigable, shall remain and be held free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights.

It has been suggested that this is an irrevocable "dedication" to the States, but a glance at the whole provision will convince one that it will not bear such a construction. The proviso makes no mention of the States and does not even refer to the local laws and customs. Congress itself undertakes to lay down the essential conditions of the water right which the desert entryman may acquire: It "shall not exceed the amount of water actually appropriated and necessarily used for the purpose of irrigation and reclamation," and the free right of appropriation is made coextensive with the public lands in the States and Territories named. The claimed dedication to the States is no more than a declaration that it was

not intended by the act to withhold from free appropriation and use by the public (as theretofore under the act of 1866) for "irrigation, mining and manufacturing purposes," surplus water over and above such actual appropriation and use, under the act, and over and above that already held by virtue of "existing rights." The declaration is similar to that in the mining law of 1872 (17 Stat., 91): "All available mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to purchase, and the lands in which they are found, to occupation and purchase * * * ."

In both instances Congress states its present policy and leaves itself free to change it at will. The language of the desert land law is that of a proprietor dealing with its own property.

The case of *Hough* v. *Porter*, 51 Oreg. 318, is sometimes cited as sustaining the theory that this act is a dedication of water to the States. The learned and exhaustive opinion of Mr. Justice King finally sustains, and, indeed, depends throughout, upon the proposition that the United States, as the owner of the public domain, is quite competent to dispose of the waters thereon together with the land, or to dispose of each separately, or to dispose of one and retain the other. The question examined was whether various owners who had obtained patents for riparian lands from the United States *after* the desert land law became effective had thus acquired

full riparian rights in the waters, no reservation in that regard being expressed in the patents. The court holds that such rights (except for domestic and other purposes not named in the act) were withheld from disposition with the land by reason of this declaration of the desert land law, which the opinion in some places treats as amounting to a reservation by the Government and in others as a dedication by the Government to "the public." To hold that there was actually a dedication and that the Government had thus at one stroke parted with all its interest in the unappropriated waters was quite unnecessary to the decision; for, obviously, if the intent of the declaration was, as it may well have been (*Williams* v. *Altnow*, 51 Ore. 275; *United States* v. *Rio Grande Dam Co.*, 174 U. S. 690; *Gutierres* v. *Land Co.*, 188 U. S. 545), to set the waters apart from the land for acquisition by appropriation only, subsequent land patents would not operate to give riparian rights, whatever might be their terms as drafted in the department.

See 1 *Kinney, Irrigation*, pp. 1091, 1095.

It is this idea of the severance of the water from the land by Congress (see *Wiel, Water Rights*, p. 222) and the withholding of it for appropriation, we take it, that was said to be plausible in the reference to *Hough* v. *Porter* in *Boquillas Cattle Co.* v. *Curtis*, 213 U. S. 339, 344. The reference is as follows:

> The opinion that we have expressed makes it unnecessary to decide whether lands in

> the arid regions patented after the act of March 3, 1877, c. 107, 19 Stat. 377, are not accepted subject to the rule that priority of appropriation gives priority of right by virtue of that act construed with Rev. Stat. Sec. 2339. The Supreme Court of Oregon has rendered a decision to that effect on plausible grounds.

Wholesale dedications by the Federal Government to the States are not to be implied or found in words perfectly consistent with a different intention. *United States* v. *Oregon & C. R. Co.*, 186 Fed. 861, 893; *Oregon Railway* v. *Oregonian Railway Co.*, 130 U. S. 1, 26; *Slidell* v. *Grandjean*, 111 U. S. 412, 437.

It should be noticed further that in this proviso Congress was careful to confine its legislation to water "*upon the public lands*" and "*not navigable*," showing that it fully realized the distinction the law makes between public and private waters and that the relation of the United States to innavigable waters is that of a proprietor.

The clause in the Timber and Stone Act of June 3, 1878 (20 Stat. 89), as follows:

> That none of the rights conferred by the act approved July twenty-sixth, eighteen hundred and sixty-six, entitled "An act granting the right of way to ditch and canal owners over the public lands and for other purposes," shall be abrogated by this act; and all patents granted shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water

> rights, as may have been acquired under and by the provisions of said act; and such rights shall be expressly reserved in any patent issued under this act,

protects the water rights and rights of way "conferred by" the act of 1866 and declares that all patents shall be subject to such rights "acquired under and by the provisions of said act." This is a clear recognition that the source of water rights is the United States, and is very far from giving support to the idea that such rights are the issue of a State law, or that the power to grant them has been devolved to the States. It also shows that Congress had clearly in mind that "vested and accrued" water rights in the public-land States become such by virtue of the act of 1866 with the act of 1870, some of the language of which is used in this later legislation.

The act of March 3, 1891 (26 Stat. 1095, sec. 18), granting rights of way for irrigation purposes, declares that the privilege granted shall not be construed to interfere "with the control of water for irrigation and other purposes under authority of the respective States *or Territories*." This means the authority to control the appropriation of water on the public lands conferred by the act of 1866. The territories are put on the same plane with the States.

Colorado's brief on rehearing (vol. 1, p. 122) points out that the act of August 18, 1894 (28 Stat. 422), known as the Carey Act, grants to public-land States each a million acres of land or so much as the State

may cause to be irrigated, reclaimed, and occupied. We do not see what bearing the fact that under the act the State is to cause the lands to be irrigated has upon the questions here. The State receives the grant upon condition that it will reclaim the land in the manner provided by the act. It is required to cause it to be irrigated, reclaimed, occupied, and not less than 20 acres of each 160-acre tract cultivated by actual settlers "as thoroughly as is required of citizens who may enter under the said desert-land law."

The forest-reserve legislation of June 4, 1897 (30 Stat. 11, 34), contains a clause which provides that—

> All waters on such reservations may be used for domestic, mining, milling, or irrigation purposes, under the laws of the State wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder.

Here the uses of water intended to be allowed are such as may be practiced consistently with the objects of the reservation and by ways authorized by Congress. This provision concerning their use is merely a modified reiteration of the consistent policy of Congress, to which we have already given some attention, to leave the matter of defining and controlling the uses of water as far as possible to the local laws.

There were persons "residing within the boundaries of such reservation" owning "property or

homes" there. Others were permitted to enter for "proper and lawful purposes," including mining and milling, if they complied with the rules and regulations. *United States* v. *Grimaud*, 220 U. S. 506. The situation called for the use of water, and the object of the provision under discussion was to recognize the legitimacy of the use for the purposes specified, if consistent with the laws of the State or other laws of the United States.

An act approved February 26, 1897 (29 Stat. 599) opened to use reservoir sites which had been reserved by the General Government, with the proviso that *charges* for the water should be "subject to the control and regulation of the respective States and Territories," etc.

On March 2, 1897, Congress passed a special act (29 Stat. 603) restoring to the public domain a reservoir site, theretofore reserved, and authorizing the Secretary of the Interior to sell it to whomever might buy it for the building and maintaining of a reservoir there. It contained a proviso that the act should not be construed to "deprive the State of Colorado of the control of the water in any reservoir which may be constructed on this site by any person or corporation or association, under the regulations provided by the State laws in such cases."

Under the first of these acts Congress rates the Territories and the States on a par and makes it clear that the reservoir owner will not be allowed to fix charges for the water he stores upon any claim that State and Territorial laws respecting such matters

do not affect him. The second act preserves to the State of Colorado the regulative control of the water that may be stored in the reservoir. This act is quoted in Colorado's brief, Vol. 1, p. 122, but how it can be considered a recognition of the State's inherent or acquired ownership of innavigable waters, we do not see.

The reclamation act of June 17, 1902 (32 Stat. 388) inaugurates a new policy by which the United States itself undertakes the development of its land and water resources in the arid States, although development by private enterprise or by State action (under the Carey Act, 28 Stat. 422) is not excluded. Consequently the right of appropriators under the act of 1866, through the subordinate instrumentality of of State laws, is carefully preserved. Money received from the sale of public lands is devoted to "the construction and maintenance of irrigation works for the storage, diversion, and development of waters for the reclamation of arid and semiarid lands." Apart from any consideration of whether this policy would have been adopted if Congress had believed that the waters, indispensably necessary to make these undertakings a success, belonged to the States and so were subject to withdrawal by them at any time, the act shows that the water is assumed to be subject to the use and disposition of the Government. In section 5 it is provided that—

> No right to the use of water for land in private ownership shall be *sold* for a tract exceeding one hundred and sixty acres to

> any one landowner, and no such *sale* shall be made to any landowner unless he be an actual *bona fide* resident on such land * * * and no such right shall permanently attach until all payments therefor are made.

As rights by appropriation become vested only by beneficial use, it would seem from this that it was not thought that the Government, by undertaking these projects, would become merely a public ditch owner with no vested right in the water which the ditches would carry.

Section 8 is as follows:

> That nothing in this act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof: Provided, That the right to the use of water acquired under the provisions of this act shall be appurtenant to the land irrigated and beneficial use shall be the basis, the measure, and the limit of the right.

The first part of this section is simply a recognition of vested rights acquired under the act of 1866, and

a preservation of the existing systems of water law in the States and *territories* which have grown up under that act. (See *Gutierres* v. *Albuquerque*, *infra*, 188 U. S. 545, 552–554.) The direction of the Secretary of the Interior to "proceed in conformity with such laws," is meant like the conformity provisions in other Federal statutes to harmonize Federal activity with that which must, by compulsion of State law, go forward, if at all, under local procedure, deriving its authority from the Federal act of 1866. The concluding clause is significant: "That the right to the use of water acquired under the provisions of this act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right." Here again, we see that the State and territorial laws are rated on a par and that Congress itself undertakes to create water rights and define them. A water right acquired by appropriation and beneficial use in irrigation is not usually appurtenant to the land irrigated. 1 *Wiel on Water rights* (3d ed.) sec. 550.

Colorado's brief (Vol. 1, p. 119 et seq.) cites the acts that we have been discussing, with the exception of those of May 10, 1872, June 3, 1878, and June 4, 1897, as showing that Congress in them has recognized and affirmed the proposition laid down in the brief that the States have full, and as we understand the brief, the same soverign jurisdiction and control over all waters within their borders, innavigable as well as navigable. The distinction which the law makes between these two classes of waters is not

discussed there or elsewhere in the brief, and no attempt is made to point out how these Federal statutes recognize any such doctrine or are in any way inconsistent with Federal proprietary ownership of the innavigable waters.

In concluding this topic we observe that the legislation of Congress with regard to water rights all centers upon and is intended to preserve the policy adopted in the act of 1866 of granting the right to use the unreserved proprietary waters of the United States to individuals in accordance with local systems of water-right law.

The right-of-way parts of the act of 1866 under which appropriators of ways were granted easements over the public lands without formal action or coming into contact with Federal executive officers, have for the most part, given way to a more exact system created by the acts of 1891 (26 Stat., 1095) and 1901 (31 Stat., 790) considered by this court in the late case of *Utah Power & Light Co.* v. *United States*, 243 U. S., 389. These later laws in general adopted a plan for granting permits or licenses under executive regulation instead of easements without regulation, and substituted direct dealing between the Federal Government and the grantee for the loose indirect process permitted by the act of 1866.

Had such a plan been adopted as to water rights, or had patents for these rights been given as in the case of mining rights, is it likely that the proprietary right of the Government to the waters would ever

have been questioned, or at any rate, questioned at a later period or more persistently than was its title to the public lands? It is the long continuance of subordinate State control under a system that involves no recourse to the source of power, that has caused the fact that such control is subordinate, sometimes to be lost sight of.

(4) Grants of riparian lands in the pure appropriation States do not carry riparian water rights. The decisions to this effect are in keeping with the act of 1866, the public land policy of this country preceding that act, the same policy of Mexico, and with the rule of convenience adopted by this court by which the incidents of title taken by grantees of the Government are to be determined by the local law in the absence of congressional legislation to the contrary.

In Colorado and the other States that have not followed California's lead in retaining the riparian system, the cases hold that a grant of land from the Federal Government does not carry with it riparian rights.

Coffin v. *Left Hand Ditch Co.*, 6 Colo., 443, 448.

Clark v. *Ashley*, 34 Colo., 285.

Similarly this court has held that Mexican grants in Arizona and New Mexico did not carry water rights.

Boquillas v. *Curtis*, 213 U. S., 339.

Gutierres v. *Albuquerque Co.*, 188 U. S., 545.

The act of 1866, with the act of 1870, as we have said, protected water rights that had "vested and accrued" by "priority of possession" according to the "local customs, laws, and decisions of courts." It also provided the same means of acquiring such rights in the future. Undoubtedly the appropriation rights that had grown up in California and elsewhere in the West were the rights that were chiefly in the legislative mind at the time, because it was those rights that were the subject of controversy. Equally, without doubt, the predominant thought of Congress was to support the existing local customs and also to give the States and Territories all reasonable freedom to make their own rules in the future. The act itself speaks to that point, and the subsequent legislation that we have just been considering shows reflexively that Congress intended to favor the local law, future as well as present.

If the local law recognized riparian rights, as well as appropriation rights, the riparian owner would under that law have possession of such rights as an incident of his title to the land, and so would have that "priority of possession" which the act of Congress intended to support. If, on the other hand, the local law only recognized appropriation rights, the owner of riparian land as such would not have possession of a right to the use of water, and so would take no water right under the act of Congress nor by virtue of the Government's patent of the land.

In view of this act of 1866, it could not have been the intent of Congress to grant riparian rights with its lands when the local law recognized only appropriation rights. The construction of such a grant in the sovereign's favor and in accordance with its will, which the law requires, would not give to the grantee rights not recognized by the local law. In *Sturr* v. *Beck*, 133 U. S. 541, decided in 1890, the question was as to the right of a homesteader of riparian land, who had made no use of the water, as against a subsequent appropriator of water from the stream. The case arose in Dakota, a dual system territory. The opinion by Mr. Chief Justice Fuller treated the homesteader, Smith, as "a prior appropriator" and as having "priority of possession" under the act of 1866. The opinion (p. 552) says:

> Thus, under the laws of Congress and the Territory, and under the applicable custom, priority of possession gave priority of right. The question is not as to the extent of Smith's interest in the homestead as against the government, but whether as against Sturr his *lawful occupancy under settlement and entry* was not *a prior appropriation* which Sturr could not displace. We have no doubt it was, and agree with the brief and comprehensive opinion of the supreme court to that effect.

With less foundation it is held that the appropriator who made use of water according to the local customs before the act of 1866 has a right good

against a subsequent grantee of riparian land who also obtained his rights before that act.

> 1 *Wiel, Water Rights*, 3d Ed., Sec. 89, p. 97, and the court decisions there cited and discussed.

Here the act could do no more than throw a reflexive light upon the intent of the Government in granting the land. The controversy in the West, where possessory rights of enormous value had grown up prior to the act of 1866, was about this point, and the local courts and this court finally held, as to rights of way (*Broder* v. *Water Co.*, 101 U. S. 274), and the State courts have held as to water rights, that these possessory rights were not to be disturbed by the subsequent grant of the Government.

> *Coffin* v. *Left Hand Ditch Co.*, 6 Colo. 443, 446, 449.
> *Lux* v. *Haggin*, 69 Calif. 255.
> *Conger* v. *Weaver*, 6 Calif. 548.
> *Merritt* v. *Judd*, 14 Calif. 59, 64.

To preserve such rights this court has frequently said that the act of 1866 as to them was "more the recognition of a preexisting right than the creation of a new one."

> *Broder* v. *Water Co.*, *supra*.
> *Atchison* v. *Peterson*, 20 Wall. 507.
> *Basey* v. *Gallagher*, 20 Wall. 670.
> *Jennison* v. *Kirk*, 98 U. S. 453.

In speaking of these decisions, Mr. *Wiel* (*Water Rights*, pp. 115–116) says that the possessory rights

the public domain "as to mines and rights of way ... ers" are in the nature of fictitious grants deduced from the silence of Congress; that the act of 1866 ... legitimacy to this local custom, and that "this legislation related back to its birth and continued for the future." Says he: "It is a clear case where the law was evolved from the exigencies of the times, molded by circumstances pressing it now one way, then the other; the growth of two wars and the winning of desert and wilderness and the peopling of a continent, more potent than closeted logic."

Regardless of whether the position taken by the courts was strictly logical, the possessory rights were upheld, and the fact that they were does not militate against the original ownership of all these rights by the United States or against the present ownership of all other similar rights. The argument that it does, ... the case of water, is confronted by the fact that rights of way were equally protected, and no one would claim that the United States does not own the public land.

These cases, as far as water rights go, are in complete harmony with the rule of convenience adopted by this court under which rights in the beds of meandered innavigable streams and lakes pass or not under the Government patent in accordance with the local laws; all, of course, in the absence of legislation by Congress to the contrary.

Hardin v. *Shedd*, 190 U. S. 508.

We discuss the case just cited more fully below ... tent ourselves with pointing out here that it

fully recognizes the ownership by the United States of the beds of such waters and, by implication, of the right to the waters themselves and the full power of Congress to grant these rights if it sees fit. The doctrine of *Hardin* v. *Shedd* was applied by this court to riparian water rights in the late case of *Los Angeles Farming and M. Co.* v. *Los Angeles*, 217 U. S. 217, 233.

In *Gutierres* v. *Albuquerque Land Co.*, *supra* (188 U. S. 545), one of the contentions against the right of an appropriator to make surveys for the construction of a ditch, was that the water to be carried thereby belonged to the plaintiff as the owner of lands riparian to the stream. This court, speaking by Mr. Justice White, held that such ownership was immaterial, because for one reason it was conceded that by the laws of Mexico, in force when the Territory of New Mexico, in which the lands lay, was ceded to the United States, the use of water was not limited to riparian lands. The case thus in effect holds that a Mexican grant of lands in New Mexico did not carry riparian rights. In that case, also, the point was urged that the waters in New Mexico belonged to the United States, and that therefore certain territorial legislation permitting their appropriation was invalid as an interference with Federal property. The decision of the case was put upon the ground that the local laws did not recognize riparian rights, and is in full accord with the theory of Federal ownership of water.

Although the riparian doctrine was the general law of Mexico (*Lux* v. *Haggin*, 69 Calif. 255, 313; *I Wiel Water Rights*, 3d Ed., sec. 68; *1 Kinney, Irrigation*, 2d ed., sec. 577 et seq.), riparian rights were, it seems, not recognized in the State of Sonora. (*Boquillas* v. *Curtis*, 213 U. S. 339, 343.) The situation in Mexico was analogous to that in the territory ceded by Mexico to the United States when this country first obtained jurisdiction. (See 1 *Wiel, Water Rights*, 3d Ed. pp. 68, 966.) The water rights were the property of the owner of the public domain which was Mexico, and the lands were practically all public. The few settlers that were in Sonora had merely possessory rights on the public domain. They made use of the water just as the early California miners did, and their rights or claims were protected, not against an assertion of right by Mexico, but against an assertion by the grantee of riparian land, taking his title from Mexico. All water rights that were not granted by Mexico, being property, passed by the cession of the territory to the United States and were taken by the United States under its own law.

This court, in the case we have just been considering, while holding that riparian rights so far as the owners of Mexican grants were concerned, did not exist in New Mexico, was careful to point out that the New Mexico statute cited by the plaintiff was "not inconsistent with the legislation of Congress on the subject of the disposal of waters flowing over the public domain of the United States" and to say "O course. as held in the Rio Grande case (p. 703)

[*United States* v. *Rio Grande Dam & Irrigation Co.*, *supra*, referred to in the beginning of our argument], even a State, as respects streams within its borders, in the absence of specific authority from Congress, 'can not by its legislation destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be necessary for the beneficial uses of the Government property.' "

Similarly in *Boquillas Cattle Co.* v. *Curtis*, 213 U. S. 339, this court refused to protect a Mexican land grant on the San Pedro River in Arizona from a diversion of water from a stream to which that grant was riparian. The decision goes upon the ground that in Sonora, when the grant was made, the riparian system did not prevail, but appropriations were permitted, consequently the Mexican grant did not carry riparian rights.

Whenever Congress desires that the local law shall not govern in construing water rights in connection with its grants of lands, of course, it can so provide (*Hardin* v. *Shedd*, *supra*) and it has done so in at least one case. In South Dakota the riparian system obtains. There Congress has provided by statute (act of June 11, 1906, 34 Stat. 233, 234) that in the Black Hills Forest Reserve water may be appropriated, and specifically that the Government patent of riparian land shall not carry water rights. We shall refer more fully to this statute under the next heading.

(5) Hardin v. Shedd and other cases holding that the Government's grantee of lands bordering meandered innavigable waters takes the submerged land or not according to the local law, support the Government's title to both land and water. That the rule is merely one of convenience in interpreting the Government's grant, and that it is competent for Congress to change it, is well settled.

Colorado's brief cites these cases as supporting its theory of State ownership of innavigable waters. That the cases preceding *Hardin* v. *Shedd*, 190 U. S. 508, should not be taken as giving any support to the idea that this court recognized an ownership in the States, of the beds of innavigable waters, was made perfectly clear in the latter case. The opinion, by Mr. Justice Holmes, points out that "when land is conveyed by the United States bounded on a nonnavigable lake belonging to it, the grounds for the decision must be quite different from the considerations affecting a conveyance of land bounded on navigable water." "In the latter case," he says, "the land under the water does not belong to the United States, but has passed to the State by its admission to the Union." He then says that "when land under navigable water passes to the riparian proprietor along with the grant of the shore by the United States, it does not pass by force of the grant alone, because the United States does not own it, but it passes by force of the declaration of the State which does own it that it is attached to the shore."

"The rule," he goes on to say, "as to conveyances bounded on nonnavigable lakes does not mean that the land under such water also passed to the State on its admission or otherwise, apart from the swamp-land act, but is simply a convenient, possibly the most convenient, way of determining the effect of a grant." Then significantly, the opinion says: "We are particular in calling attention to this difference, because we fear that there has been some misapprehension with regard to the point." A dissenting opinion was written in that case by Mr. Justice White, with whom concurred Mr. Justice McKenna. The difference between the majority and the minority of the court was not, however, as to the ownership of the land or the water. Both agreed that that was in the United States.

The same question was before this court in *Kean* v. *Calumet Canal & I. Co.* (190 U. S. 452), which was decided prior to *Hardin* v. *Shedd*. In that case there was the same divergence of opinion in the court upon the question as to whether this rule of convenience should be further upheld. The majority opinion there, also delivered by Mr. Justice Holmes, said: "It is not necessary to consider how we should decide the case with our present light if the question were a new one. It is not a new one. For twelve years the decisions in *Hardin* v. *Jordan* and *Mitchell* v. *Smale* have stood as authoritative declarations of the law. Probably in most cases the statute of limitations has cured the defects of title which those cases

may have shown. Meantime many titles must have passed on the faith of those decisions. *The United States can meet them by the form of its conveyances.* It seems to us that it would be likely to do more harm than good to allow them to be called in question now."

In the dissenting opinion, which was upon the point of the wisdom of changing the rule, Mr. Justice White, with whom concurred Mr. Justice McKenna, referred to the act of 1866, the desert-land act of 1877, the right-of-way act of 1891, and the reclamation act of 1902, and also cited *Gutierres* v. *Albuquerque* and *United States* v. *Rio Grande Dam & Irrigation Co.*, as showing that the laws of the United States alone should be considered in determining questions which have arisen under them with respect to grants by the United States of its property. Mr. Justice White, referring to these statutes, said: "Besides the implication resulting from the general legislation of Congress concerning the sale and disposition of the public domain, *the special statutes granting rights in, and regulating the use of, the nonnavigable waters upon the public lands are very conclusive.*" (P. 484.)

In a later case, *Scott* v. *Lattig*, 227 U. S. 229, 244, this court adhered to the rule that the State law should govern as one of convenience, and the opinion delivered by Mr. Justice Van Devanter quotes the passage in *Hardin* v. *Shedd*, where the distinction between grants of lands bordering navigable and innavigable waters is made.

It, therefore, is the settled law that the United States owns the lands under innavigable bodies of water on the public domain, and that Congress may, if it sees fit, grant those lands in any way that it thinks proper, and may provide a rule for its grants of land bordering on such water, contrary to that of the State in which the lands lie.

Each of the three propositions which we have just stated as being settled law with regard to the shores and beds of innavigable waters is, we submit, equally the law as to the waters themselves. It must be the law as to the waters on the public lands in Colorado as well as to the waters on such lands in Illinois.

If these waters belong to the United States, as we contend they do, Congress has exclusive power over them, and it is inconceivable that any State law by virtue of its own force can determine how Congress shall grant them, or to what extent the grant of Congress shall be effective.

Wilcox v. *Jackson*, 13 Pet. 526, 537;
Gibson v. *Chouteau*, 13 Wall. 92;
Irvine v. *Marshall*, 20 How. 558, 561, 563.

Any other rule would take from Congress the disposing power over the property of the United States and put that power in the States. State sovereignty stops when it reaches the Federal property. See the cases just cited and also *Light* v. *United States*, 220 U. S. 523, 536, 537;

United States v. *Midwest Oil Co.*, 236 U. S. 459, 474;
Camfield v. *United States*, 167 U. S. 518, 526.

That Congress has, at least in one instance, exercised its right with regard to the waters themselves to provide that grants of the United States shall not be construed in accordance with the local law, is shown by the forest reserve act of June 11, 1906, 34 Stat., 233, 234, already referred to. Section 3 of that act is as follows:

> That all entries under this act on the Black Hills Forest Reserve shall be subject to the quartz or lode mining laws of the United States and the law and regulations permitting the location, appropriation, and use of the waters within said forest reserves for mining, irrigation, and other purposes; and no title acquired to agricultural lands in said Black Hills Forest Reserve under this act shall vest in the patentee any riparian rights to any stream or streams of flowing water within said reserve; and that such limitation of title shall be expressed in the patents for the lands covered by such entries.

As South Dakota is a State holding to the riparian doctrine, the patents of the United States, both under the act of 1866 and the rule of convenience, would carry with them riparian rights. Here, Congress says that it shall be otherwise and provides for the vesting of water rights in accordance with its own laws covering appropriations upon forest reserves.

(6) The claim made by the pure appropriation States, that the States own innavigable waters, was originally an outgrowth of the controversy about the protection of possessory rights before the act of 1866. It is now but an expression of opposition to the constitutional provision vesting the disposal of the property of the United States in Congress. Arguments for State ownership or control examined.

The claim of State ownership of innavigable waters was an aftermath of the bitter controversy that at one time existed about the protection of possessory rights that had grown up on the public domain after the discovery of gold and prior to the act of 1866. The fear during that period was that Congress might not provide any means for the protection of those rights and that they could not be upheld as against grants of land by the Federal Government. In the West, the principal thought of that day was that some means must be found for upholding those rights and thereby protecting existing conditions and what had been built up upon them.

Only three States were admitted before 1866—California, Oregon, and Nevada. When the appropriation States came to be admitted the controversy about possessory rights was still fresh in mind and although Congress had settled the matter in favor of those rights by the passage of the act of 1866 and had provided for the acquiring of the same sort of rights in the future, the controversy had been so bitter and the fear that those rights would not be

protected had been so great that some of the new States took the position that innavigable waters did not belong to any landowner, the United States included. They put provisions in their constitutions asserting that such waters belonged to the people. (*Wiel, Water Rights*, p. 96.)

The primary desire was to protect these so-called vested possessory rights, and it was thought that that could not be done without abrogating the common-law system of riparian rights. (See *Coffin* v. *Left Hand Ditch Co.*, 6 Colo., pp. 443, 446). Since then, various arguments have been made to support the claim of right in the States as against the Federal Government. An analysis of the positions taken by those who attempt to uphold the right of the States shows that it is now simply one of opposition to the constitutional provision which puts the disposal of the public domain and other property of the United States in Congress and therefore wholly removes such property from State control. The arguments that are usually made are, stating them briefly, (*a*) that the United States, by permitting the States to assert ownership of water in their constitutions and by ratifying those constitutions, has transferred its interest in the water to the States; (*b*) that the needs of these States, on account of their being situated in the arid region, demand the substitution of the appropriation for the riparian system and that this involves a denial of the Federal title; (*c*) and that flowing waters, because of their nature, are, like animals, *ferae naturae*, under the control of the

municipal sovereign, and so rights in such waters are under the same control.

Colorado's brief seems to argue also that, because the States have control of navigable waters, subject to the control of Congress over navigation, they also have control of innavigable waters.

(a) Ratification of State constitutions asserting State ownership of waters does not divest the United States of its property rights therein.

The provisions of the constitution of Colorado may be taken as fairly representative of those contained in the constitutions of the other States having provisions asserting ownership of water, and are as follows:

> The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the State, subject to appropriation as herein provided.
>
> Colo. Constitution, Art. XVI, sec. 5.
>
> The right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over

those using the same for manufacturing purposes.

Colo. Constitution, Art. XVI, sec. 6.

The contention is that it was the duty of Congress when creating the States to see to it that their constitutions asserted no ownership in, and assumed no control over, property of the United States which it was not the intention of Congress to convey to the States; and that if those constitutions when finally adopted contained provisions of that character they must be taken as effective congressional grants of such property to the States.

Considering the purpose to be accomplished and the part that Congress plays in creating a State, this seems an astonishing position to take. What Congress does is to bring into being a new State sovereignty to take its place with the others already existing. Its purpose is the creation of a State. It is true that by the act accomplishing that purpose it has been the invariable custom of Congress also to make specific grants of land and sometimes it makes grants of other property to the new State, but such granted property passes by virtue of the act of Congress, which is complete in itself, and not because of anything contained in the constitution adopted by the State. In those grants, also, things not enumerated are excluded by implication.

The constitution which the State adopts is not a contract between the United States and the State regarding property rights, but the fundamental instrument of the new State's polity.

The Supreme Court of Colorado quotes Mr. Cooley and says, concerning the constitution of a State:

> It is not the beginning of a community nor the origin of private rights. It is not the fountain of law nor the incipient state of government. * * * It grants no rights to the people; but it is the creature of their power, the instrument of their convenience.
>
> *Packer* v. *People*, 8 Colo. 364, 365.

The constitution may be supervised and reviewed by Congress or it may not. That of Colorado was not, and that of Oklahoma was.

Mr. Justice Lurton in speaking, for this court, of the Oklahoma Constitution, said:

> A constitution thus supervised by Congress would, after all, be a constitution of a State, and as such, subject to alteration and amendment by the State after its admission. Its force would be that of a State constitution, and not that of an Act of Congress.
>
> *Coyle* v. *Smith*, 221 U. S. 559, 568. See also.
>
> *Ex parte Webb*, 225 U. S. 663, 690.
>
> *Wilcox* v. *McConnell*, 13 Peters, 498, 516.

So far as we have found, this argument when it has been made by the Courts, has consisted merely of an assertion that the United States, by permitting the State to insert a claim to the waters in its constitution and by ratifying that constitution, has assented to the claim and done that which vests the water in the State. (See *Stockman* v. *Leddy*, 55 Colo. 24).

[illegible] case that we have found has any attempt been [illegible] to analyze the proposition, and in only one [illegible] any authority been cited. Our search has not been exhaustive however, and there may be [illegible]. The case in which the authority was cited is *[illegible] Investment Company* v. *Carpenter*, 9 Wyoming, 110, 135, 136. The passage in point is as follows:

> So far as proprietary rights of the United States are concerned, the question would seem to be settled in favor of the effectiveness of the declaration, by the act of admission, which embraces the following provision: "And that the constitution which the people of Wyoming have formed for themselves, be, and the same is hereby, accepted, ratified, and confirmed." *McCornick* v. *Western Union Tel. Co.*, 79 Fed. 449. In that case the circuit court of appeals for the 8th circuit of the United States, held that under a similar provision in the act of Congress, admitting Utah, all the provisions of the Utah constitution were invested with all authority conferred by any act of Congress.

In [illegible]*nick* v. *Western Union Telegraph Company* [illegible] sole authority cited by the Wyoming court the question was as to the right of removal to the United States court of a cause that was pending in one of the territorial courts of Utah at the time of the admission of the State. By specific provisions in the enabling act Congress had empowered the constitutional convention to provide

by ordinance for the transfer of all such cases to the Federal and State courts. The convention, pursuant to that authority, embodied a provision for that purpose in the constitution. The question before the Circuit Court of Appeals, and the one which that court considered, was whether or not what Congress had done amounted to an unconstitutional delegation of its own powers. The decision was that it did not. That is far from holding, as the Wyoming court states, that "all the provisions of the Utah constitution were invested with all authority conferred by any act of Congress" or that property rights of the United States would pass to a State by an assertion of ownership of them in a State constitution.

> The adoption in the constitution of a State, or the enactment by its legislature, of a provision that all waters within the State are the property of the State or the Public, can in no way effect the rights of the United States in and to those waters, but all rights acquired by the State must be subject to the rights of the general Government.
>
> 1 Kinney, Irrigation (2nd Ed.) Sec. 388, p. 657.
>
> A State, therefore, has the power to dedicate its waters to itself or to the public, as far as its own rights in those waters are concerned, and to regulate the use between its citizens. But to hold that a State constitutional convention or a State legislature could virtually appropriate all the waters

flowing over the public domain and belonging to the United States to itself, and acquire a good title thereto, would be too much like holding that an individual could make a deed to himself of other people's property and acquire a good title thereto.

1 Kinney, Irrigation (2nd Ed.) Sec. 388, p. 660.

(b) The argument based on the necessities of the arid region examined. It wrongly assumes that the riparian system is not suited to western conditions and that, therefore, the States can dispose of the Federal property in water.

Free appropriation of water, like free appropriation of land and minerals, was originally, as we have said, the outgrowth of conditions in the West, when, by the nonaction of Congress, all of the property of the United States could be freely taken and used by persons who were technically trespassers. Later, the protection of the rights thus acquired was the principal thing that the courts and the legislatures had in mind. The thought was that if riparian rights were recognized these possessory rights would be destroyed, and that if riparian rights could in some way be denied they would be protected. After the controversy was settled, as far as the United States was concerned, by the act of 1866, it was still thought that the development of the West demanded the free appropriation of lands and water and that the denial of riparian rights was somehow necessary to that end. All of the property

in those States, except the possessory rights which had been recognized by Congress, belonging to the United States, and Congress having by that act legislated in favor of State laws, all the States had to do to prevent riparian rights from attaching to the riparian lands as the Government granted them, was to declare by law that such rights should not so attach, and that water rights should only be acquired by appropriation. They actually did this by legislation and by the decisions of the courts.

The courts, however, in their opinions confused the riparian system as a system of water-right tenure, with the idea of free appropriation, and in some cases said that the appropriation system was better adapted to an arid region than the riparian system. They overlooked the fact that the appropriation feature of the system, that goes by that name, has nothing to do with that system as one of water-right tenure and is only a means of acquiring rights to real property, just as the entering of public lands or of a mining claim is a means of acquiring title in those cases. Further, they thought that it would be better for the development of the West if water rights should be absolute in character rather than relative, probably because, from the circumstances that surrounded the original settlers, water rights had assumed that character. They were unfamiliar with the basic principles of the riparian system and did not realize its flexibility. Many of them thought that irrigation and other extensive uses of the water were not permitted by that system

and that, therefore, less land would be watered under the riparian system than if free appropriations were permitted. However that may be, it is apparent from the early decisions and from those of the present day that the matter has not been analyzed and that no distinction has been made in the cases between the appropriation system as a means of acquiring rights and that system as a method of holding and using them.

As we have already shown, irrigation was permitted and more or less frequently practiced under the common law. It was one of the reasonable uses that the riparian owner could make of the water and that could not be objected to by other riparian owners. It would make no difference, however, if this were not the case, because the principle of the common law was that the riparian owners, taken together, could do what they would with the stream and that their rights, among themselves, were to be determined upon the principle of equality, and, therefore, that any use in the circumstances that was reasonable, both as to manner and extent, was permitted. In order that the various permitted uses could be enjoyed and protected, it was common practice under the riparian system for courts of equity to apportion the stream between the several owners. This was done in some instances even with respect to domestic uses. For a full discussion of this subject see Mr. Wiel's Work (p. 820), where he shows that apportionment between riparian owners, which is common in California, was a recog-

nized equity practice and that the California custom is not a modern departure.

Whether the western courts, if they ever had gone into the matter, would have held that the riparian system was not applicable to western conditions, is a question. It probably can be safely said that it is also a question whether, when the Western States are fully settled and all the public lands are taken up and all of the water of the streams put to use, more lands would be irrigated and more crops raised under the one system than the other.

Probably the only striking difference between the appropriation system and the riparian system is the fact that under the former the rights are absolute, while under the latter, they are relative. There is, of course, also the difference that the appropriation right may be used anywhere, while the riparian right, as against other riparian owners, can be used only within the watershed. However, the appropriation right, when it has once been acquired, may not be changed as to point of diversion, place or manner of use when such change would be to the injury of any other water users from the stream, whether they are senior or junior to the right in question. Changes of use usually do involve an injury to others, so the appropriation system in this respect is like the riparian system, as the appropriator must get the consent of other users on the stream to make a radical change.

The appropriation system permits water to be used anywhere, provided the use is a beneficial one;

and the courts have been liberal in allowing water to be transported to great distances through open and porous ditches, so that great losses are often occasioned. This fact, as far as making the best use of a stream is concerned, balances the correlative feature of the riparian system, which might in some instances fail to put the water to its highest use, by dividing it up between too many owners. Whenever this would be the case, though, under the riparian system, it is likely that the water would be put to a high use by some of the riparian owners purchasing the rights of others.

There is a tendency even now in the West for the rights of water users to become correlative and some of the State legislatures have attempted to make them, to a certain extent, of that character, by providing that the waters shall be apportioned among the several appropriators when the stream is at low stages. (*Wiel, Water Rights*, secs. 309 and 313).

Water is of such great value in the arid region that its full use, and, as far as possible, its best use, is necessary. Such best use is not being brought about by legislation, however, but by purchase and condemnation. As the low flow of the streams becomes fully appropriated no further development can take place without a storage of flood waters or a consolidation of ditches and lands irrigated. The modern tendency is, therefore, to undertake great projects which will accomplish these things. The flood waters are stored, and new and larger ditches take the place of the numerous small ones. Water is

conserved in both ways. It is often impracticable to undertake these projects unless the vested rights can be acquired or brought into the project in some way. This is often done, and when it is done, it is usual to put all of the rights of the water users on an equal basis. The water users, then, have correlative rights, as they do under the riparian system. The project, as a whole as against other users on the stream, if there are any, has the various absolute rights that it has acquired. If the project utilizes all of the waters of the stream the situation is exactly like that at common law, except, of course, that the lands are not necessarily riparian. (See statement of Mr. Bien, then supervising engineer of the Reclamation Service, quoted in *Wiel, Water Rights*, pp. 169, 339.) In these cases, where absolute rights are transformed into relative rights, the change is brought about in the same way that absolute rights have always been created, that is, by the grant of the owner or owners of the real property rights involved.

All of these systems have their firm foundation in the common law. The United States, as the owner of the innavigable waters under the common law, could, in perfect keeping with that law, grant the riparian and appropriation rights that it has granted. In California and the other States that follow her lead grants of both kinds were made. In Colorado only grants of appropriation rights were made. In both the appropriation and riparian States new kinds of uses are being made and new kinds of rights are

being created. Correlative rights are being turned into absolute rights and absolute rights are being turned into correlative rights. All these changes are being made by grant, and with the full knowledge that the subject matter is real property of the highest value. It would be unsafe to say that any particular system that exists to-day in these States is the best suited to conditions there or that any one of these systems is not suited to those conditions.

Even if the appropriation States had deliberately decided that the appropriation system was better adapted to their conditions than the riparian system and, therefore, desired that it should be put into effect, they would have been powerless to accomplish any such result without the consent of the United States. Their decision in that regard would have meant merely that they thought that more or better lands would be irrigated if absolute rights were acquired by those who should become the owners of the lands, and that the result would be best if a system of free acquisition of such absolute rights obtained. The waters would of course be of no use without the land, so the States, even if they could control the water, could accomplish nothing unless the United States provided a means for conveying the land so as to carry out the State's purpose.

Even conceding, *arguendo*, that the appropriation system would in the end produce better results than the riparian system or a lease or sale system or any other plan that a proprietor might devise for the disposal of his property, it could not be imposed

upon the United States with regard to its waters. If, the fact that one system of holding water rights is better suited to local conditions than another, is a sufficient reason for holding that the United States, which under the law owns those water rights, shall not own them, it must follow that a similar decision as to land rights would produce a similar result. It may well be that the prosperity of the arid States would be greater if the United States would convey its lands in smaller or larger tracts or would set aside certain of its lands to be held and used as commons; but would that be any warrant for the law's interfering with the plans of the United States with regard to that property? The Federal Government, of course, can make or ruin the prosperity of a State by the manner in which it disposes of the public domain, but no differences of opinion, as to how that property should be disposed of, can affect in any way the power of Congress to make the choice for itself. As a matter of fact, Congress has supported the local view and has arranged the disposition of the Federal property in full accord therewith, so that the opposition to ownership by the United States of the waters on the public lands, is simply opposition to the right of Congress, rather than the States, to have the disposal of that part of the Federal property. If the disposal of that part of the Federal property were in the hands of the States it would not change in the least the plan that they, themselves, adopted and approved; and its only practical result would be to give the

States the power to determine whether or not the Federal Government, in the use of its remaining lands and the carrying out of its Federal policies, may use the unappropriated waters of the streams and lakes. Of course, the fact that unappropriated waters belong to the United States leaves it within the power of Congress to change its policy as to future appropriations, but a radical change in that respect is not likely.

Government reclamation projects, whether of public lands or of Indian reservations, fit in perfectly with the water-right tenure features of the appropriation system. The United States holds its water as it does its land, for appropriation by others, until it withdraws or reserves some of it for the accomplishment of a Federal purpose. When it does reserve water it reserves only so much thereof as is necessary for the purpose intended and holds it, in all essential respects, as an appropriation water right. The right is, of course, subject to the grants, by appropriation, already made, and whatever water is left in the stream after the Government's reserved right is taken out, the Government holds for others to appropriate and for further reservations by itself if the need arises. The priority of a Government's reserved right is the date when it made the reservation. The right takes its place in the order of rights on the stream given it by that date.

Winters v. *U. S.*, 207 U. S. 564;
Conrad Investment Co. v. *U. S.*, 161 Fed. 829.

(c) Water rights being vested rights in real property, the State has the same and no greater control over them than over vested rights in land. The argument that water is public juris is unsound in reason and unsupported by authority and is advanced merely to support State as against Federal ownership.

Undoubtedly the States have the power to control individuals in their use of water. This right of the State may not be confined to the police power, but it can not go beyond that power and the right of eminent domain. Whatever the power is, it is limited by the provisions of the Fourteenth Amendment protecting vested rights. The power itself is the same as that which the State has over vested rights in lands. Water rights, as we have seen, under both the appropriation and the riparian doctrines, are vested rights in real property, which can be lost only by grant, condemnation, prescription or abandonment.

The Massachusetts court in a case decided in 1909 (*Home for Aged Women* v. *Commonwealth*, 202 Mass. 422, 433–434) explained the distinction in this respect, between the rights of a riparian owner in navigable and innavigable waters. Mr. Chief Justice Knowlton, who wrote the opinion, said:

> It is to be noticed first that the nature of their ownership on the border of tidewater differs from the ownership of a riparian proprietor upon an innavigable river or small stream. The title of the owner in the latter case goes to the thread of the stream, or, if his estate extends beyond the stream he owns all

> of the land under the water with a right to the flow of the water which goes with the land as a part of the real estate included in his ownership. The State has no ownership of any part of these small streams, nor any control over them except such as it has in all parts of its domain for governmental purposes. But the common law and the Colonial Ordinance give owners on the shore of the sea or on navigable tidewater in bays, harbors and inlets only a limited right beyond the line of their private ownership. Their right is that of members of the public for whose benefit the property is held by the State, with such special advantages to their property in the use of these public rights as come from its contiguity.

The Colorado Supreme Court says:

> Rights to the use of water for a beneficial purpose, whatever the use may be, are property, in the full sense of that term and are protected by Section 15, Article II, of our Constitution, which says that "private property shall not be taken or damaged for public or private use without just compensation."
>
> *Sterling* v. *Pawnee Co.*, 42 Colo. 421, 426.

The ways in which this power of the State is exercised, of course, will differ in accordance with the kind of property, the use of which is to be affected or controlled. Thus, we have regulations limiting the use of land for the public good that would not be at all applicable to water, and, *vice versa*, we have regulations concerning water that could not apply to land. Of this character are the administrative rules

and the means of enforcing them, by which officers appointed by the courts, or provided for by statute, see to it that gates are opened and shut so that the waters will be apportioned to the various owners of rights therein, according to the decrees of the courts by which they have been defined and established. This is a clear exercise of the police power, and is so held by the courts.

> The State's office is regulative, to see that those who use the water do not violate their duties to each other; and hence acts in its sovereign capacity only—not as owner of the water; the State operates only under the police power.
>
> *Wiel, Water Rights*, 3rd Ed., p. 197.
>
> No lawyer denies that sovereignty or regulative power over public uses of waters, under the police power, resides in the States; and this has not been distinguished from ownership thereof.
>
> *Wiel, Water Rights*, 3rd Ed., p. 196.
>
> This court has repeatedly upheld the irrigation law of this State as being the exercise of the police power of the State.
>
> *Roberson* v. *People*, 40 Colo. 119, 124.
>
> They (the water adjudication statutes) have been held to be a legitimate exercise by our general assembly of the police powers of the State, and the proceedings thereby furnished are in the nature of a proceeding *in rem*.
>
> *Broad Run* v. *Duel*, 47 Colo. 573, 579.
>
> The statutes are in the nature of police regulations to secure the orderly distribution of water for irrigation purposes, and to this end

to provide a system of procedure for determining the priorities of rights as between consumers.

Combs v. *Farmers*, 38 Colo. 420, 428.

Undoubtedly the State also has the right, in the interests of the public health and general welfare, to prevent the pollution of streams, but the same right extends to preventing a use of land that would be detrimental to the public in the same way.

Both appropriation and riparian rights may be lost through adverse possession (*Wiel, Water Rights*, 3d ed., sec. 579, p. 622 and sec. 863, p. 916); and it is held that the appropriation right may be lost by abandonment. The rules with regard to abandonment of a water right are the rules of the law concerning abandonment generally. The determining question is whether the circumstances show an intention on the part of the owner to abandon his property. Nonuse, however long continued, is generally only considered as an element in determining that fact. (*Wiel, Water Rights*, 3d ed., sec. 569, p. 608.)

The statutes in many States, however, provide that if the nonuse shall continue for a certain length of time, abandonment will be presumed. These statutes, however, are like those governing adverse possession and are supported on the same principle. (*Wiel, Water Rights*, 3d ed., sec. 576, p. 618.)

The courts in the appropriation States have the right to determine the amount of water necessary to irrigate crops or necessary for other uses and so to fix the limits of the appropriator's right. This is simply

because the water right does not vest in the appropriator until he has applied the water to a beneficial use and it only vests to the extent of that use. The courts do not attempt to prefer one use over another, as all uses that are beneficial are recognized, and when once the appropriator has applied water to any beneficial use he has a vested right that can not be taken away from him without just compensation. (*Wiel, Water Rights*, 3d ed., sec. 284, and cases cited in footnote 4, p. 300.)

If, under the pressure of a need in the public interest, there should be legislation to restrict the use of water to the more valuable and productive crops or to enforce an abandonment in case the water were not used, it could be supported under the police power, just as similar legislation with regard to the use of land could be upheld and just as the State would have the power to prevent the destruction of forests on private land where they were needed for the protection of stream supply and the like.

In the appropriation States the argument is now frequently made that water is *publici juris* and so under the control of the State. We can not see how this can be, as in all of those States the laws contemplate the complete appropriation of the streams. The constitution of Colorado, for instance, provides (Art. 16, sec. 5): "The water of *every* natural stream not heretofore appropriated within the State of Colorado is hereby declared to be the property of the public and the same is dedicated to the use of the people of the State, subject to appro-

priation as hereinafter provided"; and again (sec. 6): "The right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied." It is therefore seen that if the waters are *publici juris*, they are so only to serve a temporary end. It is merely to make the State the conduit by which those things which are owned by no one, under this theory, all become owned by some one. The State becomes merely the agency by which that, which it says belongs to the so-called negative community, is all transformed into ordinary rights of real property, owned by its citizens. These rights were real property under the common law, but according to this argument, their ownership can not be left where the common law puts it. The desire is to have them all ordinary real property rights again, but in order to redistribute them, the expedient of calling them things owned by no one is resorted to.

The Supreme Court of Wyoming, in the leading case of *Willey* v. *Decker*, 11 Wyo. 496, 533, puts the matter rather frankly by saying: "Under the rule permitting the acquisition of rights by appropriation, the waters become perforce *publici juris*." They do, of course, if the rights of their owner are ignored, and, in the same way, if the rights of the owner of the public lands were ignored and the State courts held that their free appropriation was not by the permission of the United States but by permission of the States, they would be forced to hold that the lands were *publici juris*, or in some other way under the control of the State sovereign. The

Wyoming court in the same case (p. 533) goes on to say that the waters of natural streams "are to be regarded as belonging to the public, subject to the right of appropriation." Here, there is clearly no public interest to serve by State ownership, save only the getting of the property into the private hands that the State chooses. The legislatures of the States are to be denied the right to withhold the waters from appropriation, and waters are to be subject to that right of the people, to be exercised by them as individuals.

The same court in the same case (p. 530), quoting *Coffin* v. *Left Hand Ditch Co.*, *supra*, says that "the doctrine of right by priority of appropriation for agriculture is evoked, as we have seen, by the imperative necessity for artificial irrigation of the soil," and it makes the assumption that we have already referred to, that irrigation was impossible under the riparian system. The court then goes on to say (p. 534): "Whatever title, therefore, is held in and to such water, resides in the sovereign as the representative of the people. The public ownership, if any distinction is material, is rather that of sovereign than proprietor."

We have quoted from this case because it is one of the leading cases—if not the leading one supporting the theory of State as against Federal ownership of innavigable waters. Its doctrine and the doctrine of all of these cases that put State ownership upon the ground that waters are *publici juris*, is, in reality, that they must be so in order that the State

may have the title. However, those cases usually go back to the expressions in Blackstone and other early English writers and to expressions in the civil law, from which the confusion on this subject of *publici juris* arose. As we have seen, the confusion was in failing to distinguish between the corpus of flowing water, which is not considered either in the civil law or in ours as being owned, and the right to use the water, which is the right of prime importance in the law and the one that is real property at common law and is real property under the system of appropriation. Upon analysis, even these expressions in the old law, which caused the confusion, will be found to refer to the corpus of the water while it flows in the stream, and not to the right of use. They are only misleading when they are read without the distinction between these two ideas in mind. This is the conclusion that Lord Denman came to in *Mason* v. *Hill, supra*. The whole question, as we have already said in the first part of this brief, was settled finally long ago in England by *Mason* v. *Hill* and other cases, and in this country by a series of cases, of which *Tyler* v. *Wilkinson, supra*, decided by Mr. Justice Story, is the classical example.

In spite of the fact that it is and has been the settled law of England and of this country that innavigable waters are not *publici juris;* that the right to their use and the full right to it, belongs to the owners of the riparian land unless they have granted them away; that that right is not dependent

upon appropriation or use, long continued or otherwise; and that it does not come from the Crown or other public authority nor is otherwise derived than is the title to land itself, we think it proper to examine still further the reasoning upon which the argument to the contrary is based.

When this argument is made in its more extended form, it is that the water itself, being a fugitive, fleeting thing, is incapable of ownership, unless and until it is reduced to possession. Then, by way of bridging a gap, it is argued that by taking possession of some of the water the appropriator obtains the right to take other water, and so gets a water right. That is to say, he who captures certain individual drops or particles of water flowing in the stream, obtains thereby the right to capture other drops or particles that may be flowing there in the future.

The argument, as we understand it, seeks to get away from the idea that the one who gets a favorable position from which to capture the fleeting substance, or, in other words, has access to the stream, obtains the right, because that comes perilously near being the riparian doctrine. It tries to avoid having the right depend, in essence, upon the possession of land, or the obtaining of access to the stream, or anything of that sort, and to find the true foundation of the individual's right in the fact that he has reduced to possession a fugitive thing, which, because it was of that character, belonged, before he captured it, to the sovereign. The reasoning has a gap in it that it is impossible to bridge.

One does become the owner of the very substance of the water that he actually takes into his possession, by putting it into a bottle, for instance; and he continues to be the owner of it so long as he keeps it in his possession; but it is only by a fiction that the ownership of what is in one's possession can be said to give him the ownership of what is not, or that the taking of possession of one thing can be said to amount to the taking of possession of another, or that the capture of some water can be said to give one a water right.

We find no fault with the proposition that he who first occupies unoccupied things gains a sort of moral right, good against every one but the true owner, to continue his occupancy.

In *Atchison* v. *Peterson*, *supra* (p. 515), the possessory rights of the miners on the public domain were recognized as good against each other on this principle.

Further, we find no fault with the claim that a stream or part of it, or, to be more accurate, a water right in a stream, is the sort of thing that can be occupied. The settler on the public domain, who establishes his residence on a tract of land a mile or more from a stream and builds a ditch from the stream to that land and diverts water through the ditch, can well say that he has gained a right, even in the absence of the public-land laws, good against all others except the true owner, not only to the land and the right of way for his ditch, but to the water right. He can say that he has done that in connec-

tion with the stream which can be said to give him as good a right to continue to do it as his occupancy of the land gives him a right to continue to hold that. But on the other hand, we deny that the right so acquired is based in any way upon the fleeting character of the particles that compose the stream or upon the impossibility of their being subjected to ownership unless they are taken and kept in possession.

The whole matter, as we have said, is, to our mind, academic, as the law has been settled against those who would claim that innavigable waters are *publici juris*. It is now advanced merely to support State as against Federal ownership. If it were to be adopted as sound reasoning for the appropriation States, it would disturb the law of waters everywhere in this country. Being based in its pure form on the nature of water itself, it would apply as well to water in New Jersey and Illinois as to water in Colorado and Arizona.

The argument made in *Willey* v. *Decker* that waters are *publici juris* because they ought to be subject to appropriation is simply another way of saying that waters ought to be subject to disposition by the State rather than the Federal Government, and it is just as applicable to the public lands.

(d) The argument that because navigable waters and their shores and beds go to the States on their admission to the Union, in avoidance of State inequality and as one of the royalties of the British crown, innavigable waters should do likewise, is wholly unfounded.

In the first volume of Colorado's original brief (pp. 5 to 7) and in the brief on rehearing (pp. 30 to 83) some reliance appears to be placed upon the doctrine that the beds and shores of navigable waters go to the State in avoidance of State inequality. This doctrine is too well understood to require lengthy discussion. (See *Shively* v. *Bowlby*, 152 U. S. 1, 15, 48, where its origin and limitations are explained with great care.) Because of the public importance of navigation and fishery, navigable waters were *publici juris* at common law. The lands, being inseparable from the waters, were necessarily affected by the public interest also. The title, *jus privatum*, was in the Crown; the dominion, *jus publicum*, was also vested in the sovereign, as the representative of the nation and for the public benefit. The title to the land was thus one of the royalties or sovereign rights which passed to the original States as an incident of sovereignty when they separated from England. (*Ib.*, 46, 48; *Hardin* v. *Jordan*, 140 U. S. 371, 381.) Where there were no States, the United States held this particular class of property in trust for States to be created, and the trust was executed automatically as the new States came.

What has this to do with the question whether the States or the United States owned the innavigable waters undisposed of at the time the States were admitted, or now own the waters that up to this time have not been appropriated? As we have several times pointed out in this brief, the innavigable waters did not belong to the Crown in England, but belonged to the owners of the riparian lands, and so were, like their shores and beds, real property in private ownership. There is no public interest to protect in connection with them. The interests of navigation and fishing, on which the right of the Crown to navigable waters is based, are wholly lacking. The original States did not take this class of property, and if the Western States should take it, it would not be in avoidance of inequality, but actually would be to create an inequality between the States.

(7) The question whether the United States or the States own the water of innavigable streams in the West has never been directly passed upon by this court. The cases support Federal ownership. Opinions of text writers given and statement in report of Attorney General quoted.

As we have already shown, the California law of waters is based squarely upon the Federal title and the act of 1866; and the California cases, in this respect, are followed in the other States that have not adopted the pure appropriation system, while in those States which have adopted that system the courts for the most part deny the Federal title and

seek to find the origin of all titles to water in the State. The question has never been directly passed upon by this court; however, in a number of cases this court has incidentally considered it and expressed the view that the United States has a title and right to the waters on its public lands wholly independent of State permission. In no case that we have found has this court given countenance to the contrary theory.

None of these cases lends support to the theory that the States have any inherent power to dispose of or affect the innavigable waters flowing on the public lands and all of them accord perfectly with the theory of water law, based upon the Federal title, that we have been maintaining. The dictum in the *Rio Grande Dam* case, placing limitations upon the States as to such waters, stands not only unmodified, but is supported by the later decisions.

The cases here briefly analyzed are:

Atchison v. *Peterson*, 20 Wall. 507.

Basey v. *Gallagher*, 20 Wall. 670.

Sturr v. *Beck*, 133 U. S. 541.

United States v. *Rio Grande Dam and Irrigation Co.*, 174 U. S. 690, 704.

Gutierres v. *Albuquerque, Etc. Co.*, 188 U. S. 545.

Kansas v. *Colorado*, 206 U. S. 46.

Winters v. *United States*, 207 U. S. 564.

Boquillas Land & Cattle Co. v. *Curtis*, 213 U. S. 339.

In the early case of *Atchison* v. *Peterson* (20 Wall. 507), arising in California, and decided in 1874, an owner of water rights, acquired by appropriation in 1864, sought to enjoin subsequent mining operations on the stream on the ground that they polluted the stream to such an extent as to impair the plaintiff's prior rights. These prior rights were conceded in the opinion, but the injunction was denied because the proof failed to show that they were infringed. The opinion, by Mr. Justice Field, treats mining and water rights as on the same footing and as both coming from the United States. It also recognizes the right of the Federal Government, as the owner of both the land and the water, to convey the water separately from the land. The opinion in part reads:

> But the government being the sole proprietor of all the public lands, whether bordering on streams or otherwise, there was no occasion for the application of the common law doctrine of riparian proprietorship with respect to the waters of those streams. The government, by its silent acquiescence, assented to the general occupation of the public lands for mining, and to encourage their free and unlimited use for that purpose, reserved such lands as were mineral from sale and the acquisition of title by settlement. And he who first connects his own labor with property thus situated and open to general exploration, does, in natural justice acquire a better right to its use and enjoyment than others who have not given such labor. So the miners on the public lands throughout the Pacific States and

> Territories by their customs, usages and regulations everywhere recognized the inherent justice of this principle; and the principle itself was at an early period recognized by legislation and enforced by the courts in those States and Territories. * * *
>
> This doctrine of right by prior appropriation, was recognized by the legislation of Congress in 1866. The Act granting the right of way to ditch and canal owners over the public lands, and for other purposes, passed on the 26th of July of that year, in its 9th section declares "That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same." 14 Stat. at L., 253.
>
> The right to water by prior appropriation, thus recognized and *established* as the law of miners on the mineral lands of the public domain, * * *

In the following year, 1875, this court, speaking by the same learned justice, held in *Basey* v. *Gallagher* (20 Wall. 670), that waters could be appropriated for agricultural purposes as well as mining, and reaffirmed the position taken in *Atchison* v. *Peterson*. Speaking of *Atchison* v. *Peterson*, the court said:

> We had occasion to consider the respective rights of miners to running waters on the mineral lands of the public domain and we

> there held that by custom which had obtained among miners in the Pacific States and Territories, the party who first subjected the water to use or took the necessary steps for that purpose was regarded *except as against the government* as the source of title in all controversies respecting it. (p. 681.)

Basey v. *Gallagher* was a suit brought by a ranch owner to protect his prior appropriation of water for irrigation from infringement by a subsequent appropriator. The opinion (p. 681) points out that neither party had any title to the land, from the Government, and so the question of riparian rights did not arise.

> The question on the merits in this case is whether a right to running waters on the public lands of the United States, for purposes of irrigation, can be acquired by prior appropriation, as against parties not having the title of the government. Neither party has any title from the United States; no question as to the rights of riparian proprietors can, therefore, arise. It will be time enough to consider those rights when either of the parties has obtained the patent of the government. At present, both parties stand upon the same footing; neither can allege that the other is a trespasser against the government without at the same time invalidating his own claim.

In *Sturr* v. *Beck* (133 U. S. 541) decided in 1890, the question of the rights of a private riparian land owner did arise. Beck, as successor to Smith, an appropriator of a water right, sought to enjoin inter-

fer ace therewith by Sturr, the owner of riparian l d who had initiated his right to the land before the wr r right appropriator had initiated his rights. The i.gu tion was refused. The opinion by Mr. Chief ustice Fuller, after stating that "the right of a rip an proprietor of land bordering upon a runnin eam to the benefit to be derived from the flow . it waters as a natural incident to or one of the e ments of his estate, and that it can not be lawfu y diverted against his consent, is not de-n ," nd that "the question raised is whether Smi . cupied the position of a riparian proprietor or . rior appropriator as between himself and Sturr — the latter undertook to locate an alleged water righ " quotes the acts of 1866 and 1870. It then evie to the statement in *Atchison* v. *Peterson* to the effe that when the Government is the sole proprie of all of the lands, whether bordering on a stream or otherwise, there is no occasion for the appli ion of the common law doctrine of riparian proj orship, and states:

> Thus, under the laws of Congress and the Territory, and under the applicable custom, priority of possession gave priority of right. The question is not as to the extent of Smith's interest in the homestead as against the government, but whether as against Sturr his lawful occupancy under settlement and entry was not a prior appropriation which Sturr could not displace. We have no doubt it was, and agree with the brief and comprehensive opinion of the supreme court to that effect.

The question was whether in Dakota the acquisition of riparian lands under the laws of Congress amounts also to the acquisition of a water right. The holding that it does is in exact accord with the theory of Federal ownership of both land and water. Riparian rights were recognized by the local law as also were appropriation rights. The Federal Government's grant of riparian land, therefore, carries with it a grant of riparian water rights, since Congress has made no provision to the contrary as it has, as we have shown, with regard to patents of lands in the Black Hills Forest Reserve (34 Stat. 233, 234). To put the matter another way, as the opinion does, the land entryman under such circumstances "appropriates" both the land and the water. There is here, as also in *Atchison* v. *Peterson*, and *Basey* v. *Gallagher*, no thought of title to the water coming other than from the United States or of its originally being held by the United States in any other capacity than that of a proprietor. All of these cases are in strict accord with the California doctrine, the basis of which is the Federal title.

The proposition that the United States is the owner of the unappropriated water on the public lands and its correlary that the appropriation system, so far as it is legally effective, is the creation of Congress and not of the States finds strong support in the next case to come before this court in point of time. That case is *United States* v. *Rio Grande Dam and Irrigation Company* (174 U. S. 690). It was a suit by the United States to restrain the building by the defend-

ant company of a dam across the Rio Grande in New Mexico and appropriating the waters of that stream for irrigation to the detriment of navigation. The court assumed, for the purpose of its inquiry, that the defendants were intending to appropriate the entire unappropriated flow of the river at the point where they proposed to construct the dam, and that such appropriation would "seriously affect the navigability of the river where it is now navigable." (P. 702.) The decision was that the cause should be remanded with instructions to order an inquiry as to whether the intended acts of the defendants would substantially diminish the navigability of the steam, and, if so, to enter a decree restraining those acts to that extent.

The opinion, by Mr. Justice Brewer, is important here because the limitations upon the power of the States to deal with innavigable waters were considered from the standpoint of the Federal proprietary interest as well as from that of the Federal power to protect navigation. In part the opinion is as follows (p. 703):

> Although this power of changing the common-law rule as to streams within its dominion undoubtedly belongs to each state, yet two limitations must be recognized: *First, that in the absence of specific authority from Congress a state can not by its legislation destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be necessary for the beneficial uses of the*

Government property. Second, that it is limited by the superior power of the general government to secure the uninterrupted navigability of all navigable streams within the limits of the United States.

Further along in the opinion, the water sections of the act of 1866 and of the desert land act are quoted and it is stated that "obviously by these acts, so far as they extended, Congress recognized and assented to the appropriation of water, in contravention of the common-law rule as to continuous flow," and "in reference to all of these cases of purely local interest the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, although in contravention to the common law rule, which permitted the appropriation of those waters for legitimate industries." The conclusion is then reached that it was not the intent of Congress by the acts above referred to to permit appropriations to the detriment of navigation.

The next case, in point of time, is that of *Gutierres* v. *Albuquerque, etc., Company,* 188 U. S. 545, heretofore considered by us, in connection with our argument that those cases which hold that United States and Mexican grants of land in pure appropriation states do not carry grants of riparian water rights, are in full accord with the theory of Federal ownership of unappropriated waters. In this case an act of the legislature of the Territory of New Mexico, incorporating the defendant ditch company, was drawn in question.

The opinion, by Mr. Justice White, assumes, *arguendo*, the title to the water on the public lands to be in the United States, and upholds the local legislation as being such as permitted by the act of 1866 and subsequent legislation of Congress. It reasserts the proprietary rights of the United States as they were asserted in *United States* v. *Rio Grande Dam and Irrigation Company*, *supra*, and points out that it was the purpose of Congress "to recognize as well the legislation of a Territory as of a State with respect to the regulation of the use of public waters" (p. 553). We quote further from the opinion (p. 552):

> The contentions urged upon our notice substantially resolve themselves into two general propositions: First, that the territorial act was invalid, because it assumed to dispose of property of the United States without its consent; and, second, that said statute, in so far at least as it authorized the formation of corporations of the character of the complainant, was inconsistent with the legislation of Congress and therefore void. These propositions naturally admit of consideration together.
>
> The argument in support of the first proposition proceeds upon the hypothesis that the waters affected by the statute are public waters, the property not of the Territory or of private individuals, but of the United States; that by the statute private individuals, or corporations, for their mere pecuniary profit, are permitted to acquire the unappropriated portion of such public waters, in violation of the right of the United States to control and

> dispose of its own property wheresoever situated. Assuming that the appellants are entitled to urge the objection referred to, we think, in view of the legislation of Congress on the subject of the appropriation of water on the public domain, particularly referred to in the opinion of this court in *United States* v. *Rio Grande Irrigation Co.*, 174 U. S. 690, 704–706, the objection is devoid of merit. As stated in the opinion just referred to, by the act of July 26, 1866, c. 262, sec. 9, 14 Stat. 253; Rev. Stat. sec. 2339, Congress recognized, as respects the public domain, "so far as the United States are concerned, the validity of the local customs, law and decisions of courts in respect to the appropriation of water."

The desert-land act, the right of way act of 1891, and section 8 of the reclamation act are then mentioned and in part quoted, and the opinion then proceeds (p. 554):

> It would necessarily seem to follow from the legislation referred to that the statute which we have been considering is not inconsistent with the legislation of Congress on the subject of the disposal of waters flowing over the public domain of the United States. Of course, as held in the *Rio Grande Case* (p. 703), even a state, as respects streams within its borders, in the absence of specific authority from Congress, "cannot, by its legislation destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be

> necessary for the beneficial uses of the government property;" and the power of a state over navigable streams and their tributaries is further limited by the superior power of the general government to secure the uninterrupted navigability of all navigable streams within the limits of the United States. Necessarily, these limitations are equally applicable in restraint of the legislative branch of a territorial government, controlled, as is such body, by Congress.

Kansas v. *Colorado*, 206 U. S. 46, decided in 1907, is not an authority to the contrary of the position taken in *Rio Grande Dam & Irrigation Co.* v. *U. S.* The Government there sought to maintain its intervention upon the broad theory that because the policies of Colorado and Kansas, respecting the use of the waters of the Arkansas, were conflicting, and because neither State was competent to regulate that use outside of her own borders, the entire power of regulation must be held to reside in the United States. Such a Federal power was said to be essential to insure the reclamation of arid lands—not lands of the United States alone, but arid lands generally. This was claimed as an inherent power of sovereignty—a sort of national police power springing from the needs of the situation. The opinion, of course, concedes the power of the United States to control the disposition of its public domain. Its interest in the use of water upon its own lands or the advantageous reclamation, use, and disposition of its own lands, or its general proprietary interest in nonnavigable waters was not in issue.

Winters v. *United States* (207 U. S. 564), discussed at the beginning of this brief, was decided a year after *Kansas* v. *Colorado*. The suit was brought by the United States to restrain appropriators of waters of Milk River in Montana from preventing those waters from flowing to the Fort Belknap Indian Reservation in sufficient quantity to supply the needs of the reservation. In 1888, while Montana was still a territory, Congress ratified a treaty or agreement with the Indians, under which the Indians ceded a large area of land to the United States, and Congress, in turn, set aside for their use the reservation referred to; and it was expressed in the agreement that this was done so that the Indians might "become self-supporting as a pastoral and agricultural people." Milk River, an innavigable stream, was designated as the northern boundary of the reservation, but the agreement made no mention of its waters and made no mention of any waters as reserved for the Indians. The State was admitted into the Union in the following year. The Government used a small quantity of water on the reservation, and above it on the river a considerable farming community of white settlers subsequently grew up. The prosperity of this community was largely based upon the use of Milk River water that had been appropriated under the desert land act and the local laws. The lower court held that, under the circumstances, a reservation of sufficient water for the needs of the Indian Reservation must be implied, and enjoined interference in any manner with the

use by the reservation of 5,000 inches of water, which was a much greater amount than had at any time been used by the Government or the Indians. This decree was affirmed by this court.

The opinion by Mr. Justice McKenna, after holding that a reservation of water in favor of the Indians must be implied, concludes:

> Another contention of appellants is that if it be conceded that there is a reservation of the waters of Milk river by the agreement of 1888, yet the reservation was repealed by the admission of Montana into the Union, February 22, 1889, c. 180, 25 Stat. 676, "upon an equal footing with the original states." The language of counsel is that "any reservation in the agreement with the Indians, expressed or implied, whereby the waters of Milk River were not to be subject to appropriation by the citizens and inhabitants of said state, was repealed by the act of admission." But to establish the repeal counsel rely substantially upon the same argument that they advance against the intention of the agreement to reserve the waters. The power of the government to reserve the waters and exempt them from appropriation under the state laws is not denied, and could not be. *United States* v. *Rio Grande Ditch & Irrig. Co.* 174 U. S. 702; *United States* v. *Winans*, 198 U. S. 371. That the government did reserve them we have decided, and for a use which would be necessarily continued through years. This was done May 1, 1888, and it would be extreme to believe that within a year Congress

destroyed the reservation and took from the Indians the consideration of their grant, leaving them a barren waste—took from them the means of continuing their old habits, and yet did not leave them the power to change to new ones.

Appellants' argument upon the incidental repeal of the agreement by the admission of Montana into the Union and the power over the waters of Milk river which the State thereby acquired to dispose of them under its laws, is elaborate and able, but our construction of the agreement and its effects make it unnecssary to answer the argument in detail. For the same reason we have not discussed the doctrine of riparian rights urged by the government.

It will have been noticed that neither the appropriators' argument that a State, by the fact of its admission as a State, acquired the right to dispose of the waters of the river, nor the claim made by the Government that the reservation was entitled to riparian rights, was discussed in detail, because the court's "construction of the agreement and its effects made that unnecessary." The "effect" of the agreement was to reserve the water, and it was held that "the power of the Government to reserve the waters and exempt them from appropriation under the State laws is not denied and could not be." As supporting this proposition only the two cases of *United States* v. *Rio Grande Dam & Irrigation Co.* and *United States* v. *Winans* were cited. The Government's power is, therefore, put upon two grounds, first, that a State's

right to dispose of the waters of innavigable streams within its borders is limited by its lack of power to destroy "the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be necessary for the beneficial uses of the Government property," which is the doctrine of Government ownership for which we are contending; and, second, that the United States, at the time when the reservation was made, which was before the admission of the State, as the possessor of full sovereignty, both national and municipal, Federal and State, had full power to reserve the waters, even if they were, like the beds of navigable streams, property of a character that, if undisposed of previously, would pass to the State upon its admission to the Union. The holding that it was unnecessary to discuss the Government's claim of riparian rights as such is significant in view of the opinions being based, in part, at least, upon the doctrine of the *Rio Grande Dam* case. It is, we submit, equivalent to saying that, even if riparian rights do not exist in Montana, the United States is entitled to, at least, enough of the waters flowing upon its own lands to supply their needs as was stated in the *Rio Grande Dam* case.

The decision in the *Winters* case upholds the doctrine of Federal reservation of water rights, and has been followed in *Conrad Investment Co.* v. *United States*, 161 Fed. 829 (C. C. A.).

Boquillas Land & Cattle Company v. *Curtis* (213 U. S. 339), decided in 1909, and above discussed in

our consideration of the question of Federal and Mexican grants of land not carrying with them riparian water rights, was, as we there said, a case in which the owner of a Mexican land grant on the San Pedro River in Arizona sought to enjoin a diversion from that stream on the ground that it would interfere with its rights as a riparian owner. The relief was denied. The main thing considered was whether the land owner, because of its ownership of riparian lands under its grant from the State of Sonora, was entitled to riparian rights in the water as at common law, and it was held that it was not. The decision was put upon the ground that, under the law existing in Arizona at the time of the grant and since, the riparian system did not prevail, and appropriations were permitted. The source of the title to appropriation rights was not inquired into, nor was the right of the United States to convey riparian rights with its grants of riparian lands considered. The court held that the patent of the United States to the grant owner operated merely as a confirmation of the Mexican grant and in no way as an enlargement thereof. Therefore, what water rights the United States had to convey and whether a grant by the United States of riparian lands in Arizona would carry water rights, were questions not decided.

The opinion says in effect that, in view of the holding that the confirmatory patent was not to be taken as a grant from the United States, but merely as a confirmation of what Mexico had already granted,

it was not necessary to decide whether a patent from the United States, made after the passage of the Desert Land Act, would carry riparian rights. It will be remembered that that act provides that "* * * All surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers, and other sources of water supply upon the public lands and not navigable, shall remain and be free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights," and that the supreme court of Oregon in *Hough* v. *Porter*, *supra*, 51 Oreg. 318, decided that after that act the United States' grants of riparian land have not carried water rights. The opinion mentions the Oregon case and says, in a passage we have heretofore quoted, that it was decided on plausible grounds. The grounds on which it was decided and which were said to be plausible, were that riparian rights had been abrogated by *Congress* and not by the State.

The attitude of the executive branch upon this subject is thus expressed by the Attorney General in his 1914 report, page 39:

> The department takes the position that in the arid and semiarid regions, where the legality of diverting and appropriating water for beneficial uses on nonriparian lands is generally established, the original right of the Government to appropriate surplus water for its own uses, particularly for the reclamation of its enormous holdings of arid lands, has not

> been surrendered by any act of Congress or divested by the mere creation of the States into which those regions have now become incorporated. This position has been sustained by one of the district courts of the State of Colorado. Its soundness has been challenged by certain claimants who would have the Federal user dependent on the permission of State laws. The question, never passed on, I am advised, by the Supreme Court, seems very important theoretically, but in practice it has hitherto been obviated by the general identity of interests, and the disposition of the Government to follow the State administrative procedure wherever practicable.

Colorado's brief (pp. 137–142) cites an opinion of Assistant Attorney General Campbell (*In re Withdrawal of Public Lands for Irrigation Purposes*, 32 L. D. 254) given in 1903, as supporting the claim that the United States has no authority over innavigable streams flowing over the public lands within a State. We can not see how that opinion can be made to bear any such construction.

That opinion dealt only with the power of the executive branch to assert the common-law rights of the United States in unappropriated waters, and expressly stated that the power of Congress in that regard was not being passed upon. The conclusion that the executive was without authority to withdraw waters from appropriation was erroneous. See the Reclamation Act, 32 Stat. 388, and *United States* v. *Midwest Oil Co.*, 336 U. S. 459.

[illegible] text-book writers who discuss the subject at all, so far as we have found, are unanimous in their support of the Federal title. Mr. Wiel, in his elaborate work "Water Rights in the Western States," 3d ed., obviously takes that position (see pp. 183, 197, 223).

Mr. Kinney in his late work (1912) says:

> Our conclusions upon this subject are, that the United States, as the original owner of all of the land on the public domain, was also the owner of all the waters of the natural streams and other bodies flowing thereon. By various Acts of Congress the United States has disposed of some of these waters under the Arid Region Doctrine of appropriation; and that the United States is still the owner of these waters, which have not been disposed of, regardless of the action of the State or Territory wherein they are located. The right to the use of other of its waters has also vested in the individuals who have from time to time acquired tracts of lands from the Government bordering upon the streams, as a riparian right, in those States where those rights are permitted. It was left to the various States, as a matter of sovereignty or jurisdiction to prescribe how the title to the use of the waters might be acquired by individuals, in accordance with its local customs, laws, and decisions of the Courts. When the local customs, laws, and decisions of the Courts had been fully complied with by an individual seeking to acquire a water right the title to the same vested in the individual direct from the United States, and not from any State.
>
> 2 Kinney, Irrigation, 2d Ed., Sec. 640.

Mr. Long, in the second edition of his work, A Treatise on the Law of Irrigation (sec 74, p. 134), says:

> More fully, according to the former view, the United States (or the State in the case of State lands), as the original owner of the public domain, enjoyed all the rights of a riparian proprietor in respect to the streams thereon, and such rights as have been acquired by settlers have been derived, either expressly or by implication or acquiescence, from the United States as grantor. In early times, prior to any federal legislation on the subject, settlers appropriated the water of the public domain, and their claims were recognized by the local customs, laws and decisions of courts, in all of which the federal government tacitly acquiesced. It may be said that the appropriator's rights then rested upon an implied or presumed grant from the United States. Finally these rights were expressly recognized and confirmed by the acts of 1866 and 1870. Rights acquired since the passage of these statutes, rest, of course, upon the express grant contained in the acts themselves.
>
> The view that the appropriator's rights are based upon a federal grant obtains in California and the other states which recognize the doctrine of riparian rights, and is also held in federal courts in cases arising in these states.
>
> The other view, which is generally implied rather than expressly stated in the opinions of the courts, is based upon the rejection of the common-law doctrine of riparian rights. It

seems to depend upon the proposition that even the United states as the owner of the land embraced in the territory of the states which reject the doctrine of riparian rights, never had any riparian rights in respect thereto, inasmuch as the state or territorial governments have never recognized those rights, and hence the rights of the appropriator could not have been derived from the United States but must exist as a product of state law. There is little direct judicial authority for this view, and it is certainly an extraordinary proposition that a state government, and a *fortiori* that a territorial government, has power to define the extent of the rights of the United States in respect to the public domain.

(8) Upholding of State control would disintegrate the law and destroy Federal interests without working any practical good to the States.

The Western States can show no grant of innavigable waters to them, so they can not be held to own or control such waters without putting the whole law in that field on a new foundation.

As we have already shown, the argument that the sovereign owns all waters because of the nature of water is either applicable in all of the States or is not applicable in any of them. Also, local conditions can not work a transfer of ownership from the United States to certain of the States without a distinction being made, which the law has never made, between water and other things which are the

subject of ownership, or without giving to the arid States a power and field of jurisdiction that is denied to the other States.

Water law in the dual-system States is incapable of explanation or of being put upon any logical basis if common-law principles and their sure result, Federal ownership, are to be abandoned in favor of any principles that can support ownership or power in the States. On the other hand, as we have seen, the appropriation system in Colorado and the States that follow her lead, rests as a matter of history and with logical completeness upon the same principles that that system rests upon in California, where it originated.

It certainly is an astonishing proposition that the owner of most of the land over which these waters flow lost title to the water at some period, near or remote, upon the mere admission of the States. The common law considered these estates in land and water as one. They could be separated, as we have seen; but normally and originally they belonged together. These particular lands were practically useless without the water, and certainly the water was useless without the land. Furthermore, access to the water could not be obtained without the landowner's permission. To say that under these circumstances the owner of all the land had no interest in the water, or that it would be desirable that one sovereign should own the land as a proprietor and that another sovereign should own the water as a royalty or otherwise would be a *reductio ad absurdum*.

Besides these objections based upon the law, there is this very important practical objection to State ownership of water—that while working no practical good to the States, because the liberality of Congress has fully taken care of appropriations within them according to their own laws, it would put the Federal Government, as the proprietor of vast areas of land, at the mercy of the States, and so would disastrously affect its great reclamation, Indian, and other Government policies.

PART TWO.

The controversy, as one involving an interstate stream, should be decided upon the basis of the Federal ownership of lands and waters, thereby confining the ownership of the States, as ultimate proprietors, to such water rights as have been or may be granted to the respective States for themselves or for use in connection with the lands within their borders.

(1) Examination of the question of division of waters between States upon the basis of State ownership of innavigable waters and disregarding the Federal title.

In coming to the question of the principles that should govern the determination of this controversy as one involving an interstate stream, it is important to be borne in mind that any division of such waters at all between the states must involve a restriction upon the right of the upper State on the stream to use all of the water. A right somewhat in the nature of an easement must be upheld over the

stream in the upper State in favor of the lower State. This is so because water rights, whether riparian or appropriation, to be of any real value (except in the few instances where the land on which the water is to be used embraces the very sources of the stream) must have two elements, namely: The right to take the water from the stream at a particular point and use it, and the right to have the water flow down to that point uninterfered with by any one above.

In this case we have the State of Colorado, within whose territory the Laramie River rises and flows for a considerable distance, contending that as a sovereign State it has the right to use the waters of that stream as it will within its own borders, regardless of the effect of such use upon the flow of the stream below in Wyoming; and contending further that if its rights do not go to that extreme, it is entitled, as against Wyoming, to an equitable share of the waters of the stream. Both of these contentions are based upon the doctrine that a State, as such, has a title to all property and resources within its borders, superior to and behind the titles of its citizens. (See *Georgia* v. *Tennessee Copper Co.* 206 U. S. 230.) That doctrine, as applied by Colorado, embraces the idea that, in the last analysis the State owns all that its citizens own and all else within its dominions, and that therefore the State has the right to say the last word as to everything within its territory—air, land, minerals, and water. This is also the conception embraced in Colorado's first contention of absolute right over the stream until it leaves

its State line. We do not understand that this idea of absolute right is insisted upon strongly by Colorado. The brief filed on Colorado's behalf, while not abandoning the idea of absolute right, concedes that the upper State's rights in an interstate stream may be limited to a certain extent in favor of the lower State, upon the theory that States, like individuals, can only enjoy their own rights in so far as their doing so is consistent with a recognition of exactly the same rights in others.

Both States in their arguments have left entirely out of consideration the fact that the United States was the original owner of all of the land, and all of the water within their borders, and still is the owner of all unpatented lands and of all unappropriated waters. They also leave out of consideration the position of the United States as a proprietor which is at the same time a sovereign, and treat the question of the rights in this stream as one involving only the two State sovereigns. But the presence of the United States, the superior sovereign, as both owner and grantor, gives the controversy an entirely different character from that which it would have if it were one between two States, the property within which was all owned by or came from the States; for since the United States has had and has granted to individuals and still has, such vast property interests in the two States, it can not be said that these two States represent, as ultimate owners or otherwise, all of the property within their respective borders.

However, before discussing the significance of the Federal title in this connection, let us examine the possibilities of a division of the waters of the stream as if the case were one where the States are entitled to say the last word as to all of the property involved.

In determining the respective rights of States in property we are entitled to assume that the broad principles of the common law are to be adhered to, generally speaking, not because those principles have any force or controlling power over the States, as law, but because they are fundamentally just, and so give rules, generally speaking, as applicable to sovereign landowners as to landowners who are the subjects of a sovereign. Under the doctrine of *Georgia* v. *Tennessee Copper Co.*, supra, the rights of States are to be considered in a broader and less technical way than those of individuals. However, in fixing a rule binding upon States, the welfare of all the States taken as a whole should be considered, and in order to do that the effect of any such rule upon the rights and opportunities of the citizens of the United States, regardless of State citizenship, must be taken into account.

The question in a controversy between States regarding a stream that flows through the lands of both is, What interests do the respective States have in that stream? That is to say, what property rights do they own in the stream as against each other?

25595—17——10

(a) The proposition that the upper State on a stream may use all of the water regardless of the effect of such use upon the flow of the stream in the lower State, is untenable.

This is so, both on authority and on principle. This court decided in *Kansas* v. *Colorado*, 206 U. S. 46, that a dispute between States concerning an interstate stream constitutes a justiciable controversy determinable in this court. No countenance was given to the idea that the upper State was free to use all the water. On the contrary, the idea that rights in the stream possessed by the lower State would reach up to and affect the stream as it flowed in the upper State was accepted as one of the basic principles upon which the case was considered.

One can easily imagine circumstances that would make the great use of the water of an international stream by a State situate above another thereon to the detriment of a lower State so repugnant to natural ideas of justice as to warrant the lower State in resorting to force to put a stop to it. (*Missouri* v. *Illinois*, 200 U. S. 496.) If that is so, it surely follows that between the States of our Union the principle must be recognized that the upper State is not entitled in all cases and under all circumstances to use and exhaust the stream as it will, but that in some cases at least it must, in spite of its own needs, allow a certain amount of the water flowing within its borders to leave them and flow down to the State below.

Our treaty with Mexico regarding the Rio Grande (May 21, 1906, 34 Stat. 2953) and the treaty with Great Britain involving the waters of the St. Marys and Milk Rivers in the United States and Canada (Jan. 11, 1909, 36 Stat. 2448, 2451), were made upon this theory. It is true that in both treaties stipulations to the effect that they should not be taken as precedents and should not constitute an acknowledgment of obligation were made. The fact, however, remains that in these instances where controversies actually arose, neither this country in dealing with Mexico, nor Canada and the United States in dealing with each other settled those controversies upon the basis of the upper State's being free to take all of the water.

Furthermore, the rights of the United States and the rights of private persons as its grantees make the allowance of such a claim between the two States here impossible. We have not paused to consider that matter under this head, however, as we are here considering the principles that should control the settlement of this controversy if Federal interest were eliminated.

(b) A division upon the basis of priority of appropriation illogical under theory of State ownership of water.

If the upper State is not to be allowed to use all of the water if it sees fit to do so, some rule of division of the water between the States must be found, or at least some means must be had for determining

when the uses in the upper State infringe the rights of the lower State.

Private rights in interstate streams, except where they have been decided on the basis of priorities created by Federal grants under the act of 1866, as in *Howell* v. *Johnson*, 89 Fed. 556, have been determined upon the theory that the two States permit overlapping rights to be acquired as a matter of comity, each State having in substance the same or at least reconcilable laws under which rights can be acquired by individuals and not having provided by statute, as was the case in *Hudson Water Co.* v. *McCarter*, 209 U. S. 349, that State water should not be taken beyond the State line.

Bean v. *Morris*, 221 U. S. 485.
Hoge v. *Eaton*, 135 Fed. 411.
Anderson v. *Bassman*, 140 Fed. 14.
Morris v. *Bean*, 123 Fed. 618; 146 Fed. 423.
Rickey Land & Cattle Co. v. *Miller & Lux*, 218 U. S. 258.
Taylor v. *Hulett*, 15 Idaho, 265.
Willey v. *Decker*, 11 Wyo. 496.

Wyoming, in its brief on rehearing, takes the position that priority of appropriation should govern here, notwithstanding this is a controversy between States. We understand, however, that it is her contention that that feature of the riparian doctrine which confines the uses of riparian owners to the watershed (unless all of the riparian owners consent to a diversion beyond the watershed) should likewise govern.

It is difficult to see how priority of appropriation can be adopted as the rule of decision in this case without taking the Federal title as a basis. If we eliminate the rights of the United States and the power of Congress to dispose of those rights and the consideration that the owner of those rights is a sovereign, we have two States facing each other simply as paramount landowners. As such, how can they be confined in their rights in the stream to the water that they have already appropriated, and, as to the surplus waters, be given merely a right to make further appropriations? The fact that their laws both recognize priority of appropriation as governing the rights of their citizens can have no bearing. These laws in neither instance were made to govern the State itself as against another State. No rule of comity could apply in a case where the States are seeking to assert rights *in invitum* against each other. Furthermore, Colorado has lately passed an act designed to retain such waters as she controls within her own borders. (Act of Mar. 30, 1917, Session Laws of Colorado, 1917, p. 539.)

If these States were, in truth, the original and ultimate owners of all of the property within their borders, they would have a right to a fair share of the water upon whatever principle determined, regardless of whether they had put it to use or not. Would Wyoming, for instance, be willing to admit that as against Colorado she was without power to change her local water system to-morrow to the riparian system, for instance? She certainly ought

to have that right, as against another State; and she would not have it if priority of appropriation were to be the rule between these States. If each State has full rights in the stream, save only as those rights must yield to the possession of the same rights by the other State, some rule ought to be found by which the unappropriated waters could be divided, in case either of the States insisted upon it. Only in that way could the rights of the States, treating them as original and ultimate property owners, be given full consideration, and they be left free to use their property or not as they see fit.

Clearly no rule ought to be adopted in this case that would be opposed in principle to a rule of division that would have to be adopted between other States, and the rule of priority of appropriation would not be applicable to a controversy between two riparian States. Since it would not, and such States must be considered as having full rights in the stream covering all of its waters whether used or not, subject only to the equal rights of other States on the stream, how can it be said that Colorado and Wyoming do not have exactly the same rights? There is nothing that distinguishes them from the riparian States except that, as a matter of local law, each has imposed, following out the idea of State control, the doctrine of appropriation upon its citizens.

There is another serious objection to the solution suggested in Wyoming's brief, and that is that it would leave the right to use the unappropriated waters as existing in no one unless and until they

were appropriated. That idea has never found favor in the law, and the adoption of it, even as between States, might have serious and unfortunate consequences. To adopt that theory would be to announce a new and unnecessary doctrine and one which might shake the foundations of the law of waters. Furthermore, its adoption here, if the law does not require it, might be embarrassing to the political branch of the Government in its conduct of international relations.

As to the idea that uses as between States should be confined to the watershed we shall speak below, saying here merely that if a division could or should be made between States as such it ought to leave the States free to use their respective shares of the stream as they see fit; and that a rule that confined uses to the watershed would impair many vested appropriation rights now existing.

(c) A division upon the basis of riparian rights, while logical, would be difficult to work out with justice. Present developments and vested interests could not be protected by a division upon that basis.

In *Rickey Land & Cattle Co.* v. *Miller & Lux*, *supra*, the broad outlines of what might possibly be the rule for determining rights *in invitum* between the States were suggested. This court there said (p. 261):

> It is conceivable, to be sure, that the decisions of this court may determine that the states have rights as against each other *in invitum* in streams that flow through the land of both. *Kansas* v. *Colorado*, 206 U. S. 46, 84. *Missouri* v. *Illinois*, 200 U. S. 496, 519, 520.

> These rights may vary according to the system of law required by natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older states. See *New York* v. *Pine*, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper state, at least in the watershed of the stream, where irrigation is the condition of using the land. See *Kansas* v. *Colorado*, 206 U. S. 46, 100–104, 117. But whatever this court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state, and those rights, the petitioner insists, can, or at least should be, determined only in a suit brought by the state itself.

It should be pointed out that in suggesting the foregoing as the possible basis of a rule in such cases as this, this court did not have before it and did not consider the rights of the United States in the innavigable waters within the States, but considered the matter entirely upon the basis of the rights of the respective States as the paramount owners of all within their borders, and furthermore, that the controversy being between private persons, the States were not before the court and their rights were only incidentally considered.

The suggested rule would mean, that between pure appropriation States or between such a State and one having the dual system (where contro-

versies of this character are most likely to arise, for irrigation is not practiced to any great extent in the pure riparian States) the rule would be that the underlying principles of riparian rights, as at common law, would be the guide. The lands capable of irrigation within the watershed of the stream and their needs, taking them altogether, and disregarding State lines, would be ascertained and all other reasonably likely uses would be taken into account. Then we assume the waters would be divided between the States according to each State's ownership of such lands. Each State could then allow its share of the water to be appropriated by individuals and the United States or could reserve it for itself as it saw fit, either as appropriation or riparian rights or both. They could use part or all of it beyond the watershed.

The ability to use water beyond the watershed is important, as without that right reclamation projects and uses of water for domestic purposes would be in many cases made impossible. The appropriation doctrine provides the most ample scope for such uses as under it watersheds are ignored. (1 Wiel, Water Rights, 3d Ed., secs. 281, 282, and 363, and cases cited.)

Uses beyond the watershed are not so freely made under the riparian system, but they are common there. The riparian owners, whose rights would be affected thereby, can join in sanctioning such use and, of course, the right to make such a use for public purposes can be acquired by eminent domain.

In working out this plan it would be possible to make a hydrograph of the stream, as it flows in both States, and then a division of the waters, as they would flow in a state of nature at the State line, could be made that would take into account the respective quantities of riparian lands in the two States and other circumstances.

It is difficult indeed to see how a division could be made, on this theory, that would take into account private vested rights. We do not mean to imply that in a controversy between independent States there would be any need to be concerned with vested rights of private persons as such. The statement in the *Rickey* case, *supra*, that if private persons obtained any advantage from an action between States it would be accidental and not by virtue of any rights that they themselves could assert, we understand to mean merely that the States in controversies against each other, if the Federal title is left out of consideration, represent everything that is under their control within their borders, and, therefore, that if State laws have permitted the holding of rights that must fall before the claims of another State, that fact is immaterial in such a controversy. The States, however, through their citizens or otherwise, having made use of the water to a greater or less extent, and, therefore, having interests built up upon such uses, it is important not only for the welfare of the particular States, but of the country as a whole, that these uses be protected if possible.

As we said with respect to a division upon the basis of prior appropriations, if the States as landowners have rights in the stream they have them whether they make use of them or not. To say that a division that would be fair if neither State had made any special use of the water would have to be modified because one State had made a special use of it, would be either to deny the State's right as a landowner or to say that it had lost, in a measure, that right by the activity of the other State. A division, however, that ignored developments already made would be disastrous in its effects. Lands in the West have been developed and communities have grown up based upon that development, by the free appropriation of water regardless of State lines.

While a division that would take into account and preserve existing developments would probably, on the whole, be a fair one as between States, it doubtless would be easy to show that on particular streams one State is now often making use of very much more water than the other state and that the practical present division so made is not at all what would be demanded by taking into account merely stream flow and the quantity of irrigable lands within the watershed in the two States. Ascertaining and providing for present uses would of course bring further complications into the inherently difficult matter of making a division on the basis of riparian rights.

Under all of these circumstances it is hardly likely that the decision of one case would be of great help in settling other cases, or what is per-

haps more important, in making other litigation unnecessary. The decision being based upon the circumstances of the case, and those circumstances being many and involved, the question of State rights in interstate streams in the West, where the matter is of such great importance, could not well be considered as settled until the matter was litigated as between all of the States and possibly as regards each stream. In the meantime, private rights would rest under a cloud of uncertainty and interstate reclamation enterprises of every nature could hardly go forward unless under agreements made by the States with the sanction of Congress.

We respectfully submit that because of the above results no rule for the determination of interstate rights that involves the establishment of such a system ought to be adopted unless its adoption is made necessary by imperative rules of law. That, however, is not the case, as the doctrine of original Federal ownership of innavigable waters and present Federal ownership of all unappropriated waters is not only sound in law but offers a solution of the problem of interstate streams that is free from difficulties involved in any other theory.

(2) A determination of this and similar controversies on the basis of the Federal title, giving to each State only such water rights as have been granted to it or for use on its lands, would: Protect existing conditions and vested rights, including Federal property and Federal projects; make possible the undertaking of further interstate projects; make litigation between States unnecessary; and would not deny to the States sovereign control over all property rightly subject thereto. Such a settlement would be the most equitable one between States, even if not necessary under the law.

Federal property within a State, being under the exclusive control of Congress, can not be affected by State laws. The Federal Government, therefore, has full power to use that property as it sees fit and may do so regardless of State lines. Having that right, it may also grant the property to others, regardless of State lines, and its grantee's title being in no way dependent upon State law, is good and can be acquired by a State only by voluntary grant or condemnation. The Federal Government owning the property regardless of State lines and unaffected by State sovereignty, the title of its grantee is good even though it is used upon lands that would not be given a water right under a division of the waters of the stream, made in disregard of the Federal title and as between the States considering them as independent sovereignties. Under this theory, the two States here, having no interest in the waters of the Laramie River, except such as they have obtained as the ultimate owners of water rights granted by the United States to them or to private persons for

use upon lands within their borders, the rights of the States as against each other are merely to protect these water rights so obtained and the determination of any controversy arising respecting them, resolves itself into a decision as to respective priorities and their infringement.

Upon this theory, the respective rights in the stream can be determined practically as well for the whole stream, as it flows in both States, as they could be if it were wholly within one State. The local laws as to the initiation and vesting of rights may differ somewhat, but that circumstance affords no difficulty. The vested rights in Colorado would take their place among all the rights on the stream, with priorities as of the dates upon which they were initiated under the Colorado law, and the priorities of the Wyoming rights would coincide with the dates upon which those rights were initiated under Wyoming laws.

The adjudication of these rights would be no more difficult than is the adjudication of rights upon a stream of equal length wholly within one of the States. In Colorado, water districts are formed and adjudications take place within those districts. The right, however, is reserved to those who own water rights on the stream that are in another district to have their rights determined in relation to those within the district, so each right can take its proper place among all the rights in the stream. (See *O'Neil* v. *Northern Colorado Irr. Co.*, 242 U. S. 20.) As a practical matter, the adjudication within the dis-

trict usually suffices, as few, if any, rights outside of the district are so affected thereby as to make a determination of their exact relation to the rights within the district necessary.

In Arizona, where some of the streams are very long and of a flashy character, with the consequence that the rivers run water throughout their lengths during flood periods and during dry periods rise and sink in the stream beds, it is common to adjudicate the rights within a fairly compact irrigated area and not to attempt to have one adjudication cover the whole stream. (See *Montezuma C. Co.* v. *Smithville C. Co.*, 11 Ariz. 99.) The rule that the stream is a unit and that the one first in time has the prior right to the use of the waters of the stream and all its tributaries above him, is not denied, but to give him this priority does not, as a practical matter, necessitate an adjudication covering the whole stream. The plan has been adopted in some instances where groups of water users situated at some distance from each other on a stream desire to have their rights fixed, of settling the rights of the groups as such, against each other, instead of attempting to give each right its exact place among all the others. (See *Anderson* v. *Bassman*, 140 Fed. 14, 28.)

The courts in these cases do not deny the rights of the individual or lay down any new principle of law, but arrive at justice in a practical way. Often the decree takes a form, theoretically irregular but practically just, by common consent of the numerous

litigants. Wherever there is a distinct invasion of a right it can be and usually is remedied, but that rarely happens where the users are far separated on the stream.

The difficulties of settling water rights are not greater when rights are recognized regardless of State lines than they would be if State lines were considered as controlling. This is so because the Western States are so great in area and the streams in them are so long that all the difficulties that arise in settling rights regardless of State lines, are present within the States. The Gila River, for instance, extends across the whole width of Arizona and the irrigated valleys along its course are widely separated.

The question of the jurisdiction of the courts is not serious, as the courts of the upper State and the Federal courts therein would be open to the citizens of the lower State and would protect their rights. This has been done in numerous instances, as shown by the cases between private persons cited above.

A determination of the rights between these particular States upon the basis here suggested would be equitable. It would be founded upon actual appropriations made from a source held open to the citizens of each State upon the same free basis. It would be in accordance with the needs in the two States as they have actually arisen. It would respect rights already vested and would protect the communities built up upon them. If it should turn out that in the end one State got more of the waters of

the stream than the other, it would only be because in the settlement and upbuilding of the whole area out of which both States are composed, it happened that more of the lands of one State were chosen for development than the other, at a time when the choice was free. The right of the two States to control the water rights within their borders, except those belonging to the Federal Government of course, would be unimpaired within the limits of their police power. They could make such rules as they might see fit, affecting the water rights of their citizens.

The administrative system of each State would have no difficulty in distributing the interstate waters. The upper State would simply have to see to it that gates within its borders were closed in times of shortage to the proper extent and in the proper order to insure the satisfaction of prior rights in the lower State. The administrative system of the lower State would then have unhampered control within that State's boundaries.

Subject to the limitation that they could not interfere with the property of the United States, the States would retain, of course, their right to have the last word with regard to all rights within their borders, and so whatever power they possess to say that the water rights of their citizens shall not be used beyond the confines of the State would be unhampered.

25565—17——11

The sovereign powers of the State could be exercised over all property within the State properly subject thereto.

Whatever rights the States have to sue on their own behalf or for the protection of the rights of their citizens would, of course, remain unimpaired; but such suits would probably be unnecessary, as all interstate controversies would arise, in the first instance, from conflicts between individuals, and they could and would be settled by litigation between individuals.

In order to decide this case, it is perhaps not necessary to find a rule applicable to other situations. However, Federal ownership lessens the difficulty of apportioning the water of interstate streams when the States have different systems of water law.

As we have seen, any division between States as such, if logically made, would have to disregard vested rights and the important developments built up upon them. If, on the other hand, vested rights are to be protected, and so the waters apportioned regardless of State lines, no rule can be found that would uphold local systems when those systems differ, unless it is based on the Federal title. This is so because riparian rights and appropriation rights can have no relation to each other unless they come from a common source. In a contest between them, in the absence of common origin, priority could not be the test because the riparian right always existed and therefore would always be first.

Here the Federal title resolves the difficulty. The United States, as sole owner of both land and water,

BLURRE

grants both riparian and appropriation rights. The riparian grantee takes subject to all appropriation rights previously granted. He has the right to share what is left of the stream with the United States and its other grantees of riparian rights.

Inasmuch as the United States still continues to grant appropriation rights, after having granted some riparian rights, the late grantees of riparian rights, taking subject to such appropriations, must share with the former riparian grantees upon that basis. The stream as to them is diminished by the subtraction of all appropriation rights, while as to the earlier riparian grantees it is only diminished by the still earlier appropriations.

The difficulties here presented arise and have been fairly successfully overcome in California and all the other dual system States. They occur in the adjustment of the rights of late appropriators with those of prior grantees of riparian land. The matter becomes a practical one when a riparian owner seeks to enjoin a subsequent appropriator who takes water above him on the stream; and when, on the other hand, an appropriator seeks to enjoin a prior riparian owner above him from making an excessive, unreasonable, or nonriparian use to his detriment. In strict theory the nonriparian user, be he the owner of riparian land or not, has no rights as against riparian owners who would be affected by his use, unless he can show a grant of some kind from them; and so any nonriparian use that he makes is illegal against them, and likewise any use that they make

PAGES

can not be objected to by him as unreasonable. However, in practice, the nonriparian use is generally, if not always, permitted, unless and until it interferes with the actual needs of the riparian owners; and often the unreasonable uses of the riparian owner are restrained when they interfere with the nonriparian use.

This can not be done upon any theory that the riparian owners as a whole do not own the stream or that their rights, as against the rest of the world, are confined to their actual needs, as all nonriparian uses are made or permitted by riparian owners; but it is rather a widening in one way and a narrowing in another of the rights of riparian owners themselves.

A dog-in-the-manger policy, enforced against one who has been granted an imperfect interest in the stream, is abhorrent. Likewise the making of a nonriparian or an unreasonable riparian use as against an established use, though it be itself nonriparian and imperfect in right, offends ideas of justice. Consequently, the courts in many instances have decided as we have said. (See the full discussion of this subject and cases cited in *Wiel, Water Rights*, 3d ed., sec. 821 *et seq.*)

In California the courts now refuse to enjoin a nonriparian use that is not interfering with present needs but declare the riparian owners' rights so they will not be lost by adverse possession. (*Wiel, Water Rights*, 3d ed., secs. 802 and 833.)

Original Federal ownership puts these adjustments upon a sure foundation. The United States holds

its water and its land to be granted as appropriation or riparian rights as the case may be, and in accordance with the local law. These grants are made in vast areas, and it is not to be supposed that it intends by making one class of grants to unduly limit itself in making others. The rights granted should be construed in the light of the Federal policy, and when the two classes of grants are near enough together to conflict, the riparian rights can well yield its minor incidents to carry out the Federal policy with regard to the other rights. Giving the riparian land, as against all subsequent appropriations, a full right to such water as it needs, reasonably used, protects the riparian grant as fully as it can properly demand protection.

In practice a nice adjustment between riparian rights in one State and appropriation rights in another State would seldom be necessary. The pure riparian States are far distant from the pure appropriation States, and between them are situated dual system States in which irrigation is practiced extensively only in their western portions.

Irrigation generally takes place within the watershed, and the use of large quantities of water when the stream is high tends, by storage in the land and the slow return of such waters, to increase the flow of the stream beyond what it would naturally be in the low flow season. The storing of the flood waters in reservoirs and releasing it later has the same effect. These effects are especially apparent upon large streams.

Between rights in pure appropriation States and riparian rights in dual system States conflicts would seldom arise except between water users closely adjoining the boundary line. There a nice adjustment can be made, practically as such adjustments are made in the dual system States themselves.

Even if a determination of rights on interstate streams upon the basis of the Federal title and grants from the Federal Government were not made necessary, as, we contend that it is, by the law, it would still be the most equitable method to follow. The Federal Government, when all of the land in question was included in the Territories and before State lines were drawn, made its grants without any regard to where those lines would run. Eastern Colorado was in the beginning a part of Kansas. Utah was included within New Mexico, and Nevada and western Colorado were at first parts of Utah. To readjust the rights so granted to some idea of a right of the States, as now formed, to have a division on some other basis, would seem to be highly inequitable. Furthermore, a determination upon the basis of the Federal grants is the only one that fits the various systems of water law now prevailing and so makes it possible to reconcile conflicts between States having different systems, without disturbance of present rights.

(3) Ownership by the superior sovereign, the United States, of all ungranted water, and the Federal origin of all private vested rights in water, necessitate the ignoring of State lines.

What we are dealing with here is the question whether the property rights in this stream are affected by the fact that the stream is crossed by the line between the two States.

It is obvious that if the entire course of the stream were in one State these rights in its waters would in legal contemplation apply to and affect the whole stream from its source to its mouth. This would be so whether the rights were appropriation rights and so absolute in character, or riparian rights and therefore relative. A first appropriator, having the right to use ten cubic feet of water per second on a thousand acres of land at the mouth of the stream, would be entitled to enjoin a diversion made at the source, if he could prove that such diversion interfered with his getting the full amount of water that he was entitled to; similarly, a riparian owner at the mouth of the stream could enjoin a diversion at the source, if it prevented his getting his fair share of the whole stream.

Does the fact that the stream flows partly in one State and partly in another make any difference? If we have succeeded in establishing our basic proposition of Federal ownership, the answer to this question will be found in the consideration of the relation of the United States, as contrasted with that of the States, to the property which belongs to the United States.

ED PAGES

The two States here are litigating as political entities having the right to exercise certain of the powers of independent sovereigns. One of them takes the position that such powers as our States possess make them, in the last analysis, the owners of all property within their borders, and entitle them to settle all controversies with regard to property situate within their joint boundaries as they would if they were independent Nations. It is claimed therefore on its behalf that all property rights within the States, regardless of who are the proprietors of them or how their titles were derived, are included in the larger titles of the States and stand or fall therewith.

The questions then are simply, first, whether the property rights of the United States in the public lands and the water flowing thereon are held subject to the will of the United States as a soverign which is superior to the States and supreme in that field, or are held subject to State sovereignty; second, whether the property rights granted by the United States to individuals are held by them as grants from a superior sovereign and protected by that sovereign's constitution and laws, or are held, in the last analysis, as coming from the States and as being subject to destruction by the States, so far as any other sovereign power is concerned; and, third, whether any principle of the relation of the Federal Government to the States compels, or any grant of power to the States permits, State boundaries to control water rights owned by the United States or its grantees.

(a) State lines can not affect rights acquired before the States were created; therefore, in no event could a division between the States wholly disregard private vested rights.

It is clear that grants of water rights, made by the United States before the creation of the States, were not affected by the changing boundary lines of the Territories, and that those rights remain as then created, now that the States have been admitted.

Whether the power of Congress over innavigable waters within the States is limited or unlimited, it is settled that the power of Congress over them, before the States were created, was plenary. See

Shively v. *Bowlby*, 152 U. S. 1;
U. S. v. *Winans*, 198 U. S. 371;
Winters v. *U. S.*, 207 U. S. 564.

The act of 1866 provided that the owners of vested rights in water should "be maintained and protected in the same;" and the act of 1870 declared that all patents should be subject to such rights.

When the States came they found these rights existing. They were vested rights in real property granted not by them nor depending for their existence in any way upon their laws, but granted by the United States, as the proprietor and full sovereign of the whole territory, and protected by its constitution.

These rights can not be bound up in the fortunes of the States as such. New States may be created out of those now existing, or new boundaries between the States may be made. Even the States might cease to exist without such rights being affected.

Nebraska was admitted into the Union in 1867; Colorado, in 1876; Montana, North Dakota, South Dakota, and Washington, in 1889; Idaho and Wyoming, in 1890; Utah, in 1896; and New Mexico and Arizona, in 1906. It will be seen, therefore, that many of the earliest and most valuable water rights date back to territorial days. Even on the Laramie River one of the ditches, and one for which Wyoming seeks protection in this suit, was constructed, according to the list of priorities given in Wyoming's brief (p. 24), in 1868, which was before the admission of Colorado to the Union.

If we are right in our view that State lines can not affect these rights that were acquired when the States were territories, no division of waters between States could be made disregarding vested rights in general, regardless of what the position of rights acquired after the creation of the States might be.

(b) The sovereignty in the United States is vested in the whole people and not in any subdivision of them, and the control and disposition of the property which belongs to the whole people is vested exclusively in Congress.

As was said by Mr. Cooley (Const. Lim., 7th ed., p. 56), "the theory of our political system is that the ultimate sovereignty is in the people from whom springs all legitimate authority." Chief Justice Marshall, in *Cohens* v. *Virginia* (6 Wheat. 264, 389) makes it clear that the people, in whom rests the sovereignty, are not the people of the States as such but the whole people of the Nation.

BLURRED

Our Federal and State governments are merely the means through which the sovereign, which is superior to and behind them both, works its will; and the State constitutions, as well as the activities of the Federal Government, must conform to the Constitution of the United States, which is itself but the creature of the sovereign people. (*Chisholm* v. *Georgia*, 2 Dall. 419, 470–1.) It is elementary that the Federal power is supreme in its sphere.

McCulloch v. *Maryland*, 4 Wheat. 316, 427.
Claflin v. *Houseman*, 93 U. S. 130, 136;
Mondou v. *New York Ry.*, 223 U. S., 1, 57.

Even in the absence of any express grant, Congress would have the power to control and dispose of the property which belongs to the whole people, but Congress is given the power expressly. The grant is without limitation. It is "to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States."

The proposition that the control and disposition of the lands and other property of the United States are lodged exclusively in Congress has been examined repeatedly by this court in varying applications and always decided in the affirmative. Among the cases which apply it are:

Wilcox v. *Jackson*, 13 Pet. (1839) 498, 516.
United States v. *Gratiot*, 14 Pet. (1840) 526, 537.
Jourdan v. *Barrett*, 4 How. (1846) 168, 184.
Irvine v. *Marshall*, 20 How. (1857) 558.
Gibson v. *Chouteau*, 13 Wall. 92, 99.
McCarthy v. *Mann*, 19 Wall. 20.

(c) To allow State lines to limit the United States, or its grantees, in the use or protection of their water rights would be to deny to Congress the right to control and dispose of the property of the United States. Government grants of water rights are made regardless of State lines.

It is impossible to reconcile any controlling effect of State lines upon the use by the United States of the water belonging to it with exclusive and unlimited power in Congress to control the Federal property.

When the States were created no grant of power over such property was given to them and the

Federal Government in no way restricted itself as to how or where its property should be used; on the contrary, the States were required to disclaim any title to the public lands, including, of course, all their incidents, and to declare that they should be at the sole and entire disposition of the United States. Clearly the United States is free to use its property as it sees fit, unless the States have some inherent power over such property and to admit such a power in the States would be to deny that of Congress, and even to deny the paramount sovereignty of the United States within a field set apart to it by the Constitution in the most positive terms.

The uses which the Federal Government has made of the water belonging to it, including its grants of water rights to individuals, have been only such as a private proprietor could make under the common law, if the theater of such proprietor's actions were confined to one State. What the United States has done on its reclamation and other projects has been to use its water on its own lands and to a certain extent on the lands of others wherever it thought best, regardless of State lines. In making its grants of water rights it has given rights in the whole stream and not in particular parts of it.

Conceding, *arguendo*, that a private proprietor, similarly situated, could not do this, especially if the State forbade it, his lack of power would come from his being subject to State authority. It would be because he could not do with his own property that which the State, as his sovereign, forbade and had

the right to forbid. Must it not follow that if the United States can not reclaim its lands situate on both sides of a State line, using the water where it thinks best, regardless of that line, the States and not the United States are in reality the paramount owners of the property of the United States and the true sovereigns with regard to it? If the States can say to the United States "You must use your property here, and not there," it can only be because they have the sovereign right to control that property; in which case they, instead of Congress, become the disposers of the property of the United States.

The Federal Government, being competent to use the water belonging to the United States, regardless of State lines, can grant that right to others. As was said in *Irvine* v. *Marshall*, *supra* (20 How. 558, 563), the control and the disposing power of Congress over the Federal property is not dependent upon locality but "must be exclusively in the United States anywhere and everywhere within their own limits." The United States "can prohibit absolutely or fix the terms upon which its property may be used" (*Light* v. *United States*, supra, 220 U. S. 523, 536); and so, it follows, can allow its grantee to use the water where it could use it itself. To deny that right would be to put an important limitation upon the disposing power of Congress.

We are not dealing here with the power of the States to condemn water rights, after they have come into the hands of private persons, or with their right, either before or after such acquisition, to seek as against

another State or its citizens the definition, the setting off or the protection of those rights, but merely with the right of the United States to give to the individual a vested interest in water with the right to use and protect it as granted, unless and until it is condemned and paid for. A water right granted for use on land immediately across the State line would be practically useless unless the future diversions from the stream above and on the other side of the line had to respect the prior grant. The United States can place a restriction or burden of this character upon its own property which can not be taken away from the Federal grantee, at least without compensation.

It can not well be argued that Congress has not intended to grant water rights that shall be effective regardless of State lines. As we have already pointed out, the Act of 1866 provided that the "owners of such vested rights shall be maintained and protected in the same;" and the Act of 1870 provided that all patents granted should be subject to such rights.

Almost all of the reclamation projects depend upon interstate waters. The grants of water rights to the settlers on these projects are grants of rights in all the project waters. If such rights were invalid or could be construed as intended to be affected by State lines, they would have to be readjusted or modified; and that would almost certainly disastrously affect a great number of the projects.

Under the North Platte project, for instance, lands in both Wyoming and Nebraska are irrigated; and it happens that the greater part of the lands, that it

ED PAGES

was found feasible to include in the project, are situated in Nebraska. The water comes from the North Platte River, which flows through both States; and, since all but the high-water flow was already appropriated, the project depends largely upon waters stored in the Pathfinder Reservoir, which is situate in Wyoming. The whole project was founded upon that reservoir. The grants of water rights to the Nebraska settlers are grants of rights in the water stored in that reservoir, and they derive almost their whole value from that fact.

(d) Rights granted by the United States to individuals are not included in and do not stand and fall with the rights of the States.

Colorado's contention, that this controversy should be decided as though it were one between independent nations, falls to the ground when once it is conceded that the water rights here involved come from the United States and are protected by its sovereign power.

The reason that the private rights of a country's citizens are included in the larger rights of the nation, and stand or fall with those rights, is that private rights come from, are dependent upon, and may be destroyed by the sovereign power of the nation. This is clearly set forth in the passages from Vattel's Law of Nations (1872 edition, Chitty), quoted in Colorado's brief (pp. 16–19).

If a political entity can not order its internal affairs as it will, free from external control, and, in the society of nations, speak the last word with

regard to all within its dominions, it is not an independent nation. As was said by Chief Justice Marshall in *Schooner Exchange* v. *McFadden* (7 Cranch, 116, 136):

> The jurisdiction of the nation, within its own territory, is necessarily exclusive and absolute; it is susceptible of no limitation, not imposed by itself. Any restriction upon it, deriving validity from an external source, would imply a diminution of its sovereignty, to the extent of the restriction, and an investment of that sovereignty, to the same extent, in that power which could impose such restriction. All exceptions, therefore, to the full and complete power of a nation, within its own territories, must be traced up to the consent of the nation itself. They can flow from no other legitimate source.

If the United States never owned any property in Colorado and Wyoming, and all private rights in those States came from the States themselves, existed by virtue of the sovereign power of those States, and could be destroyed by that power, it could be said that the private rights here involved would stand or fall with the larger rights of the States. In such a case private rights in an interstate stream would be limited by the division made between the two States, upon the theory that the States had rights against each other *in invitum* and that the States, in granting rights to their citizens, had assumed to dispose of that which was not theirs to give. If either State, in the last analysis, owned

all of the rights it assumed to deal with, except as against the other State, it could by its laws allow its citizens to have vested rights in them, but to the extent that it would have to account to the other State it, of course, would, as against that other State, have nothing to grant.

The situation here is in fact far otherwise. The ungranted waters of the Laramie River, if there are any, are the property of the superior sovereign, the United States, and so are wholly removed from State control or the effect of litigation between the States. The water grants came from the United States, exist by virtue of the sovereign power of the United States, are protected by the Fourteenth amendment of the Constitution of the United States, and can only be destroyed by the exercise of the sovereign power of the people of the whole Nation.

The cases of *Kansas* v. *Colorado*, supra (206 U. S. 46), and *Rickey Land and Cattle Company* v. *Miller & Lux*, supra (218 U. S. 258), are not authorities to the contrary. In *Kansas* v. *Colorado*, the rights of the private persons and corporations, who were made defendants with the State of Colorado, were not considered; and it was said (p. 85) that if the cause failed against Colorado it would fail also against them. Similarly, in the *Rickey* case it was said (p. 261) that in a suit between two States over the waters of an interstate stream, if a private owner should derive any advantage from the decision, it would not be in his own right, but by reason of and subordinate to the rights of his State.

In neither of these cases were the rights of the United States as a proprietor before the court or in any way considered. Also, in neither of them were the rights of grantees of the United States as such taken into account or presented to the court for consideration. We respectfully submit that all that was in mind in those cases, so far as it affects the question here, was the situation that would result if private rights in nonnavigable waters came from the States and depended for their existence upon inherent State power.

In *Howell* v. *Johnson*, supra, 89 Fed. 557, 559, water rights in a stream flowing from Montana into Wyoming were involved. The district court said: "It is urged that in some way the State of Montana has some right in these waters in Sage Creek or some control over the same. It never purchased them. It never owned them." Again, the court said that to hold that rights in Montana were superior to a prior right in Wyoming, would be to "uphold the view that a State might interfere with the primary disposal of the land of the National Government," and "when a party has obtained title to property from the National Government, the State Government has no right to destroy that title, except under the power of eminent domain. The State of Montana can not step in, and say 'the right to the water of Sage Creek, which the plaintiff acquired under the laws of Congress, you can not exercise in this State.'"

In a case involving rights in this same stream (*Bean* v. *Morris*, 221 U. S., 485), this court recognized the im-

portance vested rights would have in a controversy between States. In that case the prior vested rights of Morris, an appropriator in Wyoming, were upheld against the rights of water users in Montana. The case was decided upon the principle that the two States would be presumed to be willing to ignore boundaries and permit overlapping rights, and the question of whether Morris was not protected by the Constitution, was not passed upon. However, the opinion, which was delivered by Mr. Justice Holmes keeps in view the importance that vested rights, protected by the Constitution, would have in a controversy between States. It says (p. 486):

> We know no reason to doubt, and we assume, that, subject to such rights as the lower State might be decided by this court to have, and to *vested private rights, if any, protected by the Constitution*, the State of Montana has full legislative power over Sage Creek while it flows within that State.

and again (p. 488):

> So it is unnecessary to consider whether Morris is not protected by the Constitution; for it seems superfluous to fall back upon the citadel until some attack drives him to that retreat.

The States' power to condemn private rights is immaterial here. It is not because a nation can acquire the rights of its subjects, by making just compensation, that its rights, as an independent sovereign power, include the lesser rights of its citizens. In our States the possession of the

power to condemn private property rights is perfectly consistent with the fact that such rights come from and are protected by another and superior sovereignty. In this case, the particular private rights in question can not stand or fall with the rights of the two States, because they come from the United States and are protected by the Fourteenth Amendment, which brushes the States aside and throws its mantle of protection over the individual directly.

(e) State equality, jurisdiction, or preservation does not demand that State lines shall control.

To admit the right of the United States to use its property in water regardless of the artificial boundaries created by State lines, is merely to say that the judgment of Congress and not that of the States is to control the use of the Federal property. That property is "constructively without the legal territorial jurisdiction of individual States in every respect, and for every purpose" (*McCulloch* v. *Maryland*, 4 Wheaton 316, 395). Its being so does not interfere with the jurisdiction of the States, everywhere within their boundaries, over all their proper subjects. It does not deny State powers as such, but simply limits the field of their operation. Those powers remain intact and are the same in all of the States, regardless of how much or how little Federal property may be within them, or what use the Federal Government makes of it. State police power, subject to the protection of private rights given by the Constitution, remains fully operative

over all persons and property subject thereto, including the Federal grantees and their property rights. This court said in *Van Brocklin* v. *Tennessee*, supra:

> We take it to be a point settled beyond all contradiction or question that the State has jurisdiction of all persons and things within its territory which do not belong to some other jurisdiction, such as the representatives of foreign governments, with their houses and effects, and property belonging to or in use of the Government of the United States. Coe v. Errol, 116 U. S. 517–524.

Disregarding State lines here does not interfere with equality between the States. It is true that the new States are admitted on an equal footing with the old, but that equality is one of powers, not of subjects upon which to exercise those powers. There may be more public land in one State than another, or a greater proportion of public land, and so less land under State control in one State than another, but no one would now argue, for instance, that State equality demands a State power to tax the Federal property. The Federal Government may reserve its land in one State, for forest purposes, for instance, and it may do so indefinitely (*Light* v. *United States* supra), while making no reservations in another. No inequality between the States is created thereby; nor is it by the Federal Government's using or granting its property in water for use on either side of a State line.

State preservation does not depend upon the States having the power to say where these water rights shall be used. The waters belonging to the Federal Government are no more essential to the existence and prosperity of the State than are the lands over which it flows and without control of which the water could not be obtained or used.

The possibility that the United States might so dispose of the waters of a stream as to work injustice, can not be considered here. (See *Stearns* v. *Minnesota*, 179 U. S. 242). Such possibilities are always inherent in the possession of ultimate power. The final right must rest somewhere, and, with regard to the Federal property, it rests in the Federal Congress. The safeguard is the participation of all of the States and all of the people in the determination of the Federal action.

Viewed as property, the public domain is strictly national. (*Irvine* v. *Marshall*, *supra*.) While there are references in some opinions to the holding of property by the United States in a "private capacity," or as an "ordinary proprietor" (see *Ft. Leavenworth Co.* v. *Lowe*, 114 U. S. 525, 526; *Ward* v. *Race Horse*, 163 U. S. 504, 514; *Chicago, R. I. & P. Ry. Co.* v. *McGlinn*, 114 U. S. 525, 547), these were merely convenient expressions to distinguish the general mass from property over which the Government has exclusive jurisdiction or property devoted to strictly Governmental purposes. Properly speaking, the United States never holds property in a private capacity, but always for public objects. (*Van*

Brocklin v. *Tennessee*, 117 U. S. 161.) It has been repeatedly held by this court that the public lands are held in trust for the benefit of all the people. *Light* v. *United States*, 320 U. S. 523, 537; *Causey* v. *United States*, 240 U. S. 399, 402. The circumstance that public lands and the waters on them are situate within a particular State can not give to that State or its people any greater power over them or interest in them as property than is shared by all the States and people of the country.

The very purpose of the people, in granting the express power we have been considering, was to insure that the disposition, control and management of the common estate should be vested in the legislature of the common Government. The power of Congress is absolutely exclusive in this field and it is so because it is the property of the whole people that is dealt with.

In *McCulloch* v. *Maryland*, *supra*, this court said (p. 427):

> If any one proposition could command the universal assent of mankind we might expect it would be this—that the Government of the Union, though limited in its powers, is supreme within its sphere of action. This would seem to result, necessarily, from its nature. It is the Government of all; its powers are delegated by all; it represents all, and acts for all. Though any one State may be willing to control its operations, no State is willing to allow others to control them. The Nation, on those subjects on which it can act, must necessarily bind its component parts. * * *

> It is of the very essence of supremacy to remove all obstacles to its action within its own sphere, *and so to modify every power vested in subordinate governments, as to exempt its own operations from their own influence.* This effect need not be stated in terms. It is so involved in the declaration of supremacy, so necessarily implied in it, that the expression of it could not make it more certain. We must, therefore, keep it in view while construing the Constitution.

And again in the same case (p. 431),

> Would the people of any one State trust those of another with a power to control the most insignificant operations of their State government? We know they would not. Why, then, should we suppose that the people of any one State should be willing to trust those of another with the power to control the operations of a government to which they have confided their most important and most valuable interests? In the legislature of the Union alone, are all represented. The legislature of the Union alone, therefore, can be trusted by the people with the power of controlling measures which concern all, in the confidence that it will not be abused.

"In other words," said this court in the case of *South Carolina*, 199 U.S. 437, 456, "We are to find in the Constitution itself the full protection to the Nation, and not to rest its sufficiency on either the generosity or the neglect of any State."

CONCLUSIONS AS TO PRINCIPLES GOVERNING THIS CONTROVERSY AND THEIR APPLICATION.

We respectfully submit that in view of the foregoing the principles that should govern the determination of this cause are as follows:

1. The substantial rights which exist in nonnavigable waters, while they are in their natural state, are rights of use. These rights of use are real property rights of the highest dignity and value under both the riparian and the appropriation systems. These rights at common law are part and parcel of the lands bordering on the waters in which they exist and they belong to the owners of such lands as incidents of their title to the lands themselves, and may be transferred with or without the land. A sole owner of all the riparian land may grant such rights as he pleases, making them absolute or relative as he sees fit and allowing their use within or without the watershed.

2. The United States, as the sole owner of the public domain, originally owned all of the waters flowing thereon, or, more accurately, all of the rights to their use, as a proprietor, and so could transfer them as it saw fit. The United States under the Act of 1866 grants these rights either as appropriation or riparian rights, or both, using the local laws as subordinate instrumentalities only. All rights not so granted still belong to the United States and may be reserved or otherwise disposed of as Congress wills.

3. The power of Congress over the property of the United States is without limitation and exclusive, and so is wholly free from State control. The States have no power over the innavigable waters within their borders, except the same power that they have over lands, namely, the police power and the power of eminent domain. These powers can not be exercised upon the property of the United States.

4. The power of the United States to use the water rights belonging to it or to permit their use by others was not controlled by territorial lines fixed or changing, and is not controlled by State lines. Ownership of a water right necessarily includes the ownership of the right to use water at a particular place, together with the right to have the water flow down to that place uninterfered with by persons above.

5. The Federal Government's grantees of water rights take title to those rights with all their incidents, as vested rights in real property, protected by the Fourteenth Amendment and the laws of Congress. Their rights can only be divested by due process of law and must be respected until so divested.

6. The States, either as the ultimate owners of property within their borders (except that belonging to the United States) or otherwise, own only such water rights as have been granted by the United States to them or to others for use on lands within their borders.

Applying these principles to the case at bar, we submit that the particular diversion made in Colorado and complained of by Wyoming should not

be enjoined unless it does or will interfere with prior appropriations, that is to say, prior grants by the Federal Government, of water in Wyoming; but if it does or will so interfere, it should be enjoined to that extent.

STIPULATION.

Subject to the order and consent of the Court, it is hereby stipulated by and between the complainant and defendants, by their respective attorneys, that Clyde M. Watts, of Cheyenne, State of Wyoming, be appointed a special commissioner to take and return the testimony in this cause, offered on behalf of the complainant.

That Newton Garbutt, of Denver, State of Colorado, be appointed a special commissioner to take

and return the testimony in this cause offered on behalf of the defendants, or any of them.

That each shall have the power of a Master in Chancery, as provided in the rules of this Court, but said commissioners shall not make any findings of fact or state any conclusions of law.

It is further stipulated that the taking of testimony on complainant's behalf shall begin on the 15th day of August, 1913, at such place as counsel for complainant may designate, ten days notice thereof to be given to counsel for defendants, and shall be concluded within one hundred days thereafter; and the taking of the testimony on behalf of the defendants shall commence on or before fifteen days after the conclusion of the testimony offered on behalf of the complainant and shall be concluded within one hundred days thereafter; and the testimony in rebuttal shall be commenced on or before ten days after the conclusion of the testimony offered on behalf of defendants, five days notice of the place being given, and shall be concluded within forty days thereafter.

The said commissioners shall receive, as agreed by the parties, as their sole compensation for all services and for all testimony taken and transcribed, the sum of fifteen cents per folio for the original transcript and the further sum of five cents per folio for each carbon copy thereof, together with actual and necessary traveling expenses incurred in the taking of the testimony as aforesaid. Dated this 26th day of May, 1913.

THE STATE OF WYOMING,
Complainant,

vs.

THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, AND THE LARAMIE-POUDRE RESERVOIRS & IRRIGATION COMPANY,
Defendants.

NOTICE.

To the Honorable Thomas W. Gregory,
Attorney General of the United States,

and

To the Honorable Douglas A. Preston,
Attorney General of the State of Wyoming:

You are notified that on Monday, the 4th day of June, 1917, or as soon thereafter as counsel can be heard, the defendants herein will appear before the Supreme Court of the United States, at Washington, D. C., and ask leave to file and present a

motion herein, asking that this cause be advanced and set down for hearing, and that a rule be entered fixing the time for filing the briefs herein; a copy of which motion is hereunto attached.

Dated at Denver, Colorado, this 18th day of May, 1917.

LESLIE E. HUBBARD,
Attorney General of the State of Colorado,
AND FRED FARRAR,
Solicitors for the Defendant, the State of Colorado.

JULIUS C. GUNTER,
Solicitor for the Defendant, The Laramie-Poudre Reservoirs & Irrigation Company.

DELPH E. CARPENTER,
Solicitor for the Defendant, The Greeley-Poudre Irrigation District.

THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, a Municipal Corporation, THE LARAMIE-POUDRE RESERVOIRS AND IRRIGATION COMPANY, a corporation,
Defendants.

No. 7.
ORIGINAL IN EQUITY.

MOTION

Come now the above named parties by their respective counsel and show unto the court that the taking of evidence in said cause has been completed and that the parties have agreed upon an abstract thereof embracing such of the exhibits as may be readily reproduced, and to expedite the final hearing of said cause the parties do jointly move the court as follows:

1. That permission be granted to file herein for reference the original typewritten transcript of the evidence together with all exhibits introduced by the respective parties, and that the abstract of the testimony as agreed upon by the parties, together with the selected exhibits, be printed at the joint expense of the parties and filed herein in lieu of printing the entire transcript.

2. That an order be entered granting unto the plaintiff to and including July 15, 1916, within which to file a brief herein and granting unto the defendants to and including September 5, 1916, within which to file their briefs herein, and granting unto the plaintiff twenty days after the filing of the briefs on behalf of the defendants within which to file its reply brief.

3. That an order be entered herein advancing this cause upon the calendar and assigning it for argument upon the first day of the October, A. D. 1916, term of this court, or as soon thereafter within said term as to the court shall be convenient, and enlarging the time for oral argument to four hours upon each side.

DOUGLAS A. PRESTON,
Attorney General of Wyoming, of Counsel for Plaintiff.

FRED FARRAR,
Attorney General of Colorado, of Counsel for Defendant State of Colorado.

JULIUS C. GUNTER,
Attorney for Defendant Laramie-Poudre Reservoirs & Irrigation Company.

DELPH E. CARPENTER,
Attorney for Defendant Greeley-Poudre Irrigation District.

NO. 20. ORIGINAL.

THE STATE OF WYOMING, Complainant,

vs.

THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, A MUNICIPAL CORPORATION, THE LARAMIE-POUDRE RESERVOIRS AND IRRIGATION COMPANY, A CORPORATION, Defendants.

DEMURRER.

To the Honorable, the Judges of the Supreme Court of the United States:

The defendants, by protestation, not confessing or acknowledging all or any of the matters or things in the said bill of complaint contained to be true in such manner and

form as the same are therein set forth and alleged, demur to the said bill, and for cause of demurrer show:

I.

That said bill of complaint is wholly without equity, in that it does not state or show any such cause as doth or ought to entitle complainant to the relief sought or prayed for against these defendants or against either thereof, or to any relief whatever.

Wherefore, and for divers other good causes for demurrer appearing on the face of said bill, these defendants demur thereto and pray the judgment of this Honorable Court whether they or either of them shall be compelled to make further or any answer to said bill; and they humbly pray to be hence dismissed with their reasonable costs in this behalf sustained.

Attorney General of the State of Colorado, Defendant.

Solicitors for the Greeley-Poudre Irrigation District, Defendant.

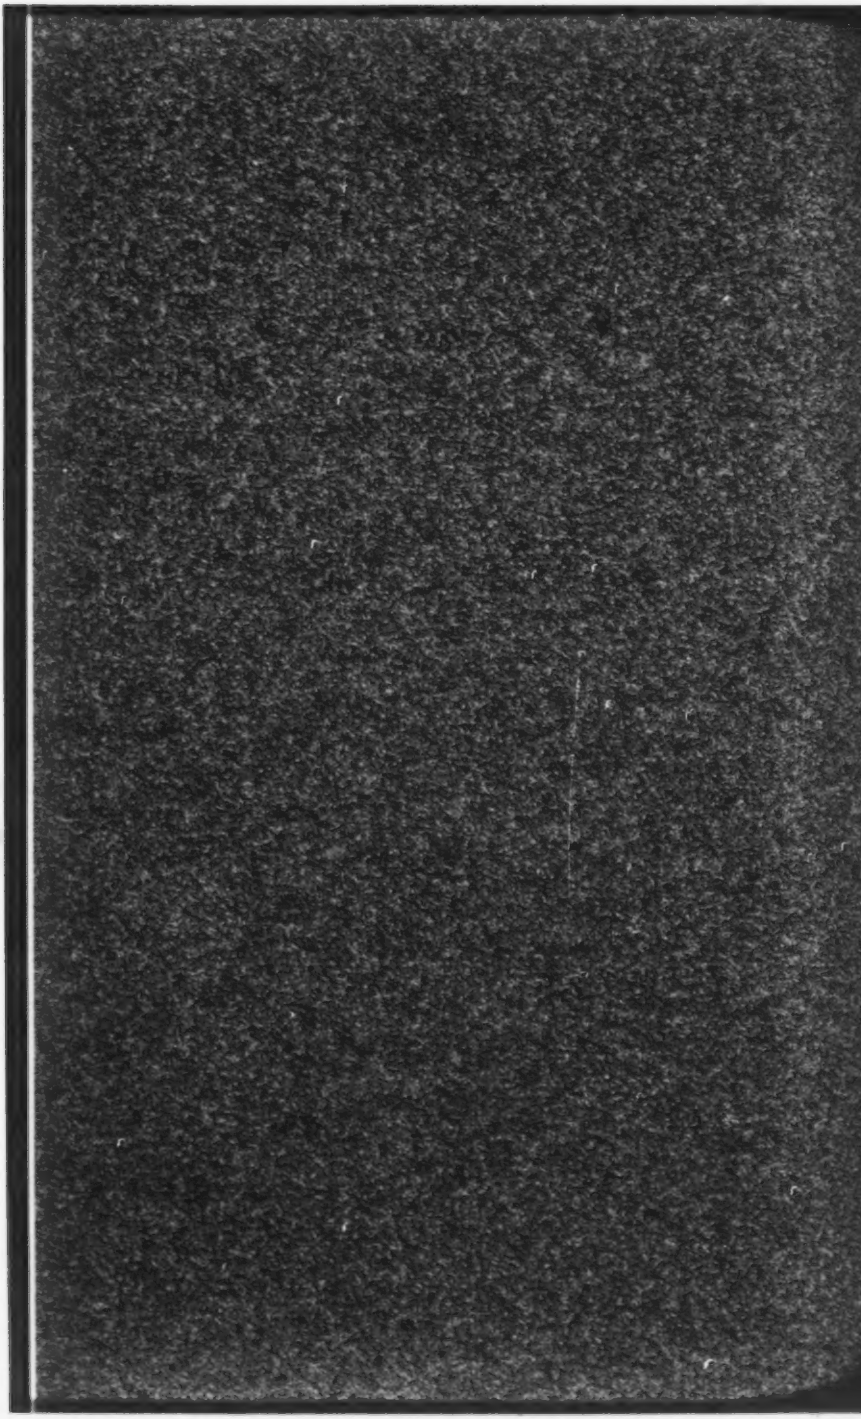
BRIEF FOR THE DEFENDANT STATE.

[illegible]



INDEX.

	Page
Introductory statement of contentions of Wyoming and Colorado and position of United States	1
The effect of these questions upon the public interests and governmental policies of the United States	4
The question of original ownership of innavigable waters fundamental in this controversy	5
Argument	6
PART ONE. The United States retains its original plenary ownership of the right of use of innavigable waters in the Western States, except in so far as it has parted with it through acts of Congress; and this property, like the property in the public lands generally, is wholly immune from State interference or control. The State power affects only those rights which have been granted by Congress	6
Upon the acquisition of the territory now comprised within the Western States, the United States became vested with all property rights in that territory except vested private rights and such Indian rights as the United States might choose to recognize. Therefore, whatever property rights exist in water in that territory, whether the water be navigable or innavigable, belonged to the United States until the creation of the States, and furthermore, such rights are still Federal property, notwithstanding the creation of the States unless, first, they are of such a character as to go to the States upon their mere creation as such and because of the character of State sovereignty, or unless, second, they have been granted to the States or to private persons under acts of Congress	6
I.	
Property rights in navigable waters and their shores and beds become vested in the States on their creation as a part of their sovereignty, but the rule is different as to nonnavigable waters and their places of occurrence. The States take no property rights in them. Such waters are not *publici juris*, and title to their use is the same as title to land	7

Page.

(1) Because of its fugitive nature, the only property rights which exist in water in its natural state are rights of use, the corpus being only susceptible of ownership while in possession. This corpus while in possession is personal property, but the right of use of the water in its natural state is a real property right of the highest dignity and value..... 7

(2) Because of the necessity of protecting the public interests therein (mainly navigation and fishery), property rights in navigable waters in England belonged *prima facie* to the Crown, and in this country they belong *prima facie* to the municipal sovereignties, the States. The Federal Government, though having full control (under the commerce clause) for purposes of foreign and interstate navigation, has no right of property in such waters or their shores or beds except as it derives it from the States, either by grant or under operation of State law..... 9

(3) The crux of the question we are examining is whether innavigable waters are *publici juris* like navigable waters. Ownership by the States depends upon showing that they are. Such waters are not *publici juris* and ownership of usufructuary rights therein rests upon the same basis and is of the same character as ownership of land..... 12

(4) Water rights in innavigable waters being vested rights in real property, the State has the same and no greater control over them than over vested rights in land. Regulation under the police power should not be confused, as it often is, with rights of property in the State or any denial of property rights in the individual. 22

(5) The argument based on the necessities of the arid region examined. It wrongly assumes that the riparian system is not suited to western conditions and that, therefore, the States can dispose of the Federal property in water..... 23

(6) The fundamental principle of water law, that the corpus of water can only be the subject of ownership while in possession, and that, therefore, water itself in its natural state is owned by no one has no effect upon the question of whether the title to the usufructuary right therein belongs to the State as a part of its sovereignty..... 24

II.

Water rights now vested in others derive their existence, like titles to land, from the acts of Congress. All interest in water not so granted necessarily remains in the United States. The acts grant nothing to the States, and ratification of State constitutions asserting State ownership of water does not divest the United States of its property rights therein..... 25

(1) The earliest acts of Congress affecting innavigable waters—They show full consciousness of power to deal with such waters on the public lands..... 25

Page.

(2) History and nature of the act of July 26, 1866, granting water and mining rights and rights of way. Purpose and effect of its adoption of local laws and customs.....

(a) The occasion of this legislation was the extensive occupation and exploitation of the public lands in the West following the discovery of gold in California. The need was to legalize appropriations of mineral land, rights of way, and water rights already made under local customs and laws, and to provide for the future acquisition of rights of the same character in the same manner..... 26

(b) These acts of 1866 and 1870 examined—their interpretation by the courts..... 26

(3) Subsequent acts of Congress contradict the theory that Federal ownership has been abdicated..... 30

(4) Ratification of State constitutions asserting State ownership of waters does not divest the United States of its property rights therein..... 40

(5) The question whether the United States or the States own the water of innavigable streams in the West has never been directly passed upon by this court. The cases support Federal ownership..... 53

(6) Upholding of State ownership would disintegrate the law and destroy Federal interests without working any practical good to the States..... 55

PART TWO. The controversy, as one involving an interstate stream, should be decided upon the basis of the Federal ownership of lands and waters, thereby confining the ownership of the States, as ultimate proprietors, to such water rights as have been or may be granted to the respective States for themselves or for use in connection with the lands within their borders..... 57

(1) In practice the Federal Government disregards State lines in the use and control of waters for its own purposes, and State lines have been equally disregarded in the grant and acquisition and use of private water rights in the western States, so a division of water between the States making State lines controlling would interfere with the Federal use of water and seriously modify or destroy existing vested rights. These rights being grants from the paramount Federal sovereignty, should be upheld as against the claim that the States which enjoy a quasi sovereignty only should be treated in this respect as independent nations and the waters be divided between them on that basis and in disregard of the rights of the Federal Government and of the Federal grants. The contentions of the States are not in accord with fundamental ideas of either State sovereignty or water law and are impracticable..... 60

(2) Conclusions as to specific application of principles discussed to the case at bar..... 64

THE STATE OF WYOMING, complainant, v. THE STATE OF COLORADO, THE Greeley-Poudre Irrigation District, and The Laramie-Poudre Reservoirs and Irrigation Company.	No. 3, Original. In equity.

BRIEF FOR THE UNITED STATES.

Reargument 1922.

(Supersedes former brief.)

Introductory statement of contentions of Wyoming and Colorado and position of United States.

Wyoming seeks an injunction prohibiting a certain specific diversion and use in Colorado of a part of the waters of the Laramie River, an interstate stream. Wyoming seeks to protect rights that it claims for itself as a sovereign State and rights that it claims on account of State ownership of riparian lands, and also the individual rights of its citizens. It denies

the right of Colorado to permit the waters in question to be taken beyond the watershed. It pleads the case in such a way that it can rely upon the pure doctrine of prior appropriation or upon the riparian doctrine, if the riparian doctrine should be upheld as between individuals or as between two States, or, as we take it, upon any rule of division that this court may decide to be the proper one between States.

Colorado in its answer says that the waters of the Laramie River rise in the mountains of Colorado; denies that they have been fully appropriated; alleges certain priorities in Colorado; and claims that there is ample water for all appropriations so far made in both States. Colorado, however, goes further and asserts that as a sovereign State it not only has a right to assert and urge the claims of its citizens but that it, in its sovereign capacity, is the ultimate owner of all of the waters within its territorial borders, as one of its natural resources, and may do with them as it will.

Colorado, as we understand it, also takes the position that if two States as against each other have rights *in invitum* in streams that flow through the lands of both, there should be applied the doctrine of a reasonable and equitable sharing by the two States of the benefits in the interstate stream, and that under that doctrine the 91,000 acre-feet of water that it claims on account of the particular diversion here complained of does not constitute an

unreasonable trespass upon Wyoming, because after this diversion is made there would be left a reasonable amount of water in the river for use in Wyoming.

Wyoming, in its brief on rehearing, takes the position, if we understand that brief properly, that priority of appropriation should govern between States as it does between individuals, with the exception that between States the uses ought to be confined to the watershed.

The contention of the Government is that the principles sought to be upheld by both Colorado and Wyoming, failing as they do, to recognize the proprietary rights of the United States in the waters of innavigable streams upon lands that at one time were all the property of the United States, and seeking a solution of the problem of interstate streams without taking into account such Federal ownership or the grants of water rights made under the acts of Congress, are unsound in law and opposed to the vital interests of the United States, and, if established, might be fatal to important Government policies and result in an almost inextricable confusion of water rights in such streams. The attitude of the executive branch of the Government, is briefly that the United States has not surrendered to the States or lost to them or parted in any way with its original right to use the surplus waters (those not appropriated by others under its own laws) of innavigable streams in the Western States; that the United States is and always has been, since

the cession of the territories now comprised in those States, the owner of all the unappropriated and surplus waters; that the appropriated waters there have been granted by the United States under its own laws, using local customs and State laws as subordinate instrumentalities only; that the rights of the States, both as the actual owners of lands granted to them and as the ultimate owners of the property of their citizens, so far as they may be said to be such owners, are confined to such water rights as have been granted by the United States to them or their citizens under the laws of Congress; and that controversies such as this should be decided upon the basis of such Federal grants, and without regard to State boundaries.

The effect of these questions upon the public interests and governmental policies of the United States.

We think it sufficient here to call attention to the vast areas of land still belonging to the United States; the fact that much of it is in the arid region where land without water to irrigate it, is of little value; the Federal reclamation policy, which depends upon Federal use of both land and water and often upon Federal use of interstate streams; the Federal Indian policy, where the Government's ability to protect its Indian wards depends largely upon its ownership and control of the waters on reservations and other Indian lands; and, finally, to the fact that if the water on these

public lands be held to belong to the States the Federal Government will be at the mercy of the States and be helpless as to these policies in a very real sense, because, while under our system the States are represented in and have a powerful influence upon the Federal Government, the United States is not in any way represented in the States, and both theoretically and as a practical matter can not control or even influence their action.

The question of original ownership of innavigable waters fundamental in this controversy.

We respectfully suggest the necessity of keeping separately in mind the two questions of, first, whether the United States or the States own the right of use of the innavigable waters in the Western States, and, second, the effect of a decision of that question upon the rights of these two opposing States in the waters of an interstate stream.

It is our contention that Federal ownership controls and offers a logical and workable solution of this question of rights between the States; but even if we should be wrong as to this, we deem it clear that the United States owns the right of use of the waters in and on its public lands within the States, just as it owns the lands themselves, and that such ownership should not be thrown in doubt by any decision as to the broader question of the rights between States.

ARGUMENT.

PART ONE.

The United States retains its original plenary ownership of the right of use of innavigable waters in the Western States, except in so far as it has parted with it through acts of Congress; and this property, like the property in the public lands generally, is wholly immune from State interference or control. The State power affects only those rights which have been granted by Congress.

Upon the acquisition of the territory now comprised within the Western States, the United States became vested with all property rights in that territory except vested private rights and such Indian rights as the United States might choose to recognize. Therefore, whatever property rights exist in water in that territory, whether the water be navigable or innavigable, belonged to the United States until the creation of the States; and, furthermore, such rights are still Federal property, notwithstanding the creation of the States unless, first, they are of such a character as to go to the States upon their mere creation as such and because of the character of State sovereignty, or unless, second, they have been granted to the States or to private persons under acts of Congress.

I.

Property rights in navigable waters and their shores and beds become vested in the States on their creation, as a part of their sovereignty, but the rule is different as to nonnavigable waters and their places of occurrence. The States take no property rights in them. Such waters are not *publici juris*, and title to their use is the same as title to land.

(1) Because of its fugitive nature, the only property rights which exist in water in its natural state are rights of use, the corpus being only susceptible of ownership while in possession. This corpus while in possession is personal property, but the right of use of the water in its natural state is a real property right of the highest dignity and value.

Failure to keep always in mind this first principle of the law of waters and to distinguish between ownership of the water itself and ownership of the right to use it has been the cause of confusion of thought in many of the cases, modern as well as ancient. The right to use water is one of the most substantial property rights known to the law and partakes in no way of the transitory character of the water itself which at any particular time makes up the stream in which the right exists. The law does not regard the water flowing in a stream (or properly, we think, any water out of possession) as being owned by those who have the right to use it, or, in fact, as being owned at all. The law does, of course, recognize an ownership in water itself when it is confined or treated as a commodity, as when, for example,

it is flowing in an irrigation ditch or is bottled for sale. It is then treated as personal property.

On the other hand, the rights which exist in connection with waters in their natural state—rights in waters flowing in a stream or in water of a pond—are rights of use.

> *Tyler* v. *Wilkinson*, 4 Mason 397.
> *Kent*, 3 Comm. (Marg.), p. 439.
> *Embrey* v. *Owen*, 6 Ex. 352, 20 L. J. Ex. 212.
> *Hargrave* v. *Cook*, 108 Calif. 72.

As the New York court puts it in *Smith* v. *Rochester*, 92 N. Y. 463, 480, "neither sovereign nor subject can have any greater than a usufructuary right therein."

Mr. Wiel, in his learned and exhaustive work on Water Rights, thus states the law in this respect:

> This usufructuary right, or "water right," is the substantial right with regard to flowing waters; is the right which is almost invariably the subject matter over which contracts are made and litigation arises. It is not an ownership in the water itself; it is merely a privilege to use the water, and hence purely *incorporeal*.
>
> *Wiel, Water Rights*, 3d ed., p. 755.

That this incorporeal right of use—this water right—is real property and that the title to it is of as high dignity as the title to land, is established beyond question in all jurisdictions in this country, so far as we know. There is no authority to the contrary that we are aware of and no difference in this respect between the riparian States and the so-called appropriation States.

Gardner v. *Newburgh*, 2 Johns. Ch. 162, 166.
Long, Irrigation, 2d ed. (1916), sec. 34, p. 70.
1 Wiel, Water Rights, 3d ed. (1911), sec. 711, p. 777 *et seq.*, and numerous cases cited, sec. 283, p. 298; sec. 285, p. 301;
2 Kinney, Irrigation, 2 ed. sec. 769, p. 1328.
Washburn, Easements, 4th ed., pp. 316, 317.
2 Washburn, Real Property, 6th ed., sec. 1284;
Insurance Co. v. *Childs*, 25 Colo, 360, 363.
Davis v. *Randall*, 44 Colo. 488, 492.

(2) Because of the necessity of protecting the public interests therein (mainly navigation and fishery) property rights in navigable waters in England belonged prima facie to the Crown, and in this country they belong prima facie to the municipal sovereignties, the States. The Federal Government, though having full control (under the commerce clause) for purposes of foreign and interstate navigation, has no right of property in such waters or their shores or beds except as it derives it from the States either by grant or under operation of State law.

This doctrine is too well understood to require lengthy discussion. (See *Shively* v. *Bowlby*, 152 U. S. 1, 15, 48, where its origin and limitations are explained with great care.) Because of the public importance of navigation and fishery, navigable waters were *publici juris* at common law. The lands being inseparable from the waters, were necessarily affected by the public interest also. The title, *jus privatum*, was in the Crown; the dominion,

jus publicum, was also vested in the sovereign, as the representative of the nation and for the public benefit. The title to the land was thus one of the royalties or sovereign rights which passed to the original States as an incident of sovereignty when they separated from England. (*Ib.*, 46, 48; *Hardin* v. *Jordan*, 140 U. S. 371, 381.) Where there were no States, the United States held this particular class of property in trust for States to be created, and the trust was executed automatically as the new States came.

Not only the land but the navigable waters themselves were *publici juris*. Whatever property right there was in them, and that, as we have said above, as to all waters out of possession, was merely a right of use, was *prima facie* in the Crown. Under our system, control of interstate and foreign commerce being one of the powers delegated to the Federal Government, the rights of the States and all rights derived from them, or permitted under their laws in such waters and their shores and beds, are taken subject to this Federal power. It follows that whatever injury of State or private interests results from the use by the Federal Government, for commerce purposes, of navigable waters and their beds, or their shores up to high-water mark, there is no invasion of legal rights. The State right and the private right come after and are subordinated to this superior Federal right. It follows further, of course, that any State or private use thus interfered with does not have to be paid for. The Federal Government is

simply using that which it has a right to use and to which use all other uses are subordinated.

United States v. *Chandler-Dunbar Co.*, 229 U. S. 53, 62.

So, also, we take it, with regard to rights of the States as against private persons, and even the Federal Government when that Government is not acting under the commerce clause. The property rights in the beds, in the shores up to high-water mark, and in the navigable waters themselves belong, *prima facie*, to the States, and it is for them to say through their legislatures and the decisions of their courts to what extent, if at all, private rights shall be granted or permitted and whether or not these rights shall be taken subject to future destruction without recompense for public State purposes (as they are for purposes of Federal commerce control) or shall be taken with the obligation of the States to pay therefor if they destroy them.

The right of the State and of the Federal Government in their respective fields extends, also, we understand, possibly in this same way, to the use of navigable waters even if that use impairs private uses of innavigable streams that flow from such navigable waters; and, furthermore, that private uses of innavigable waters which support navigable ones may be enjoined if it is shown that they interfere with navigation and perhaps if they interfere with other public uses of the waters where they are navigable.

United States v. *Rio Grande Dam & Irr. Co.*, 174 U. S. 690.

(3) The crux of the question we are examining is whether innavigable waters are *publici juris* like navigable waters. Ownership by the States depends upon showing that they are. Such waters are not *publici juris* and ownership of usufructuary rights therein rests upon the same basis and is of the same character as ownership of land.

Waters not navigable, include, of course, not only innavigable streams and ponds, whether surface or underground, but also diffused surface flows and waters percolating in the soil. Our question is whether these waters, of common right, so far as they are owned at all—that is, the usufructuary rights therein—are the property of the States in the sense that navigable waters are, or whether they, of common right, belong to private persons just as lands do.

In the first place, it is to be noted that it is now decided beyond any further possibility of question that the beds and shores of innavigable streams and lakes, even though they are meandered, are owned as ordinary upland is owned, and are *not owned by the States*. Title to such lands in the public land States comes from the United States and not from the States.[1]

Hardin v. *Shedd*, 190 U. S. 508.

---

[1] **The fact that this court holds that the grantee of the upland from the United States takes to the thread of the stream or not in accordance with the State law, using such law as a rule of convenience merely, in no way weakens this statement. The title comes from the United States, and it is perfectly competent for Congress to change this rule of convenience applied to the grants of the United States if it sees fit.**

It needs no argument, we think, to show that the States, by virtue of their sovereignty, also have no title to the beds and shores of small unmeandered streams and ponds or to the lands in which underground streams, lakes, or percolating waters occur.

As to the property rights in these nonnavigable waters themselves it is to be observed, first, that diffused surface waters and all underground waters were originally looked upon by the law as part and parcel of the soil and as belonging to the owner thereof. The tendency now is to recognize these waters as distinct from the soil and as being susceptible of ownership when out of possession only as to usufructuary rights therein. Furthermore, the tendency is to treat such rights not only as interlocking with the rights in the streams and lakes which the underground waters support but also (even, we think, in the pure appropriation States) as belonging to the several owners of the lands which have access to them. See Wiel's Water Rights (3d ed.) for an elaborate discussion of the modern law of underground waters and particularly sections 1090 and 1124. We know of no claim even that rights of this character belong to or spring from the States.

Turning to the innavigable surface streams and lakes (and keeping in mind that the principle of exclusive private right applicable to them applies with even more force, if that is possible, to such minor bodies of water as diffused surface flows and percolating and underground waters) it will be seen

that in England it was recognized at least as early as Lord Hale's time that the proprietary right in the use and flow of such waters was not in the Crown. Unlike navigable waters they did not at common law belong *prima facie* or of common right to the Sovereign, but did so belong to private persons just as land did. The rule was and is the same in our original States, and so, following the same principle upon which this court decided that navigable waters and their shores and beds go to the new States, as well as to the original ones, as it is the States which under our system are the possessors of municipal sovereignty (*Pollard* v. *Hagan*, 3 How. 212, 229, and *Shively* v. *Bowlby*, 152 U. S. 1) we see that neither the new States nor the original thirteen have any property rights in nonnavigable waters by virtue of their sovereignty, or have any different kind of power whatever over them than they have over land.

> The State by virtue of its sovereignty is deemed the original grantor of all titles to real estate, and a conveyance by it of riparian rights upon nonnavigable streams vests its grantees, both mediate and remote, with all the rights which such owners can acquire against any grantor.
>
> The riparian owners of lands adjoining fresh water, non-navigable streams, take title, "*ad usque filum aquæ*," to the thread of the stream, and thereby acquire the right as incident to such title to the usufructuary enjoyment of the undiminished and undisturbed

flow of such water. "Fresh rivers of wha kind soever do of common right belong to the owners of the soil adjacent," is the expressive language of the common law and is of universal application. (*Clinton* v. *Myers*, 46 N. Y. 511; 7 Am. Rep. 373; *Chenango Bridge Co.* v. *Paige*, 83 N. Y. 178; 38 Am. Rep. 407.)

Contra in part:

McCarter v. *Hudson County Water Co.*, 70 N. J. Eq. 695.[1]

General expressions by some of the early writers, in which they failed to make the sharp distinction which the law now makes, and in reality always has made, between ownership of the water itself and ownership of the right to use it, and also the existence of prescriptive rights, for a time left some doubt as to whether water as such was not *publici juris* and also as to whether the riparian owner's right to divert the waters on which his land bordered was not dependent in some way upon actual appropriation.

Whatever doubt existed in that respect was put at rest in England by a series of cases of which *Mason* v. *Hill*, 5 Barn. & Adol. 1, decided by Lord Denman in 1833, was perhaps the most important. In this country the question had already been disposed of by Mr. Justice Story in *Tyler* v. *Wilkinson*,

[1] The arguments (p. 711) that if "the exercise of all rights of private ownership by all riparian owners still leaves the stream to remain as a running stream, there remains a residuum of common or public ownership that under our system rests in the State as a trustee for all the people," and that the riparian rights of private persons are narrowly limited, are, we contend, unsound and unsupported by other authorities. The rights of each riparian owner are alone limited by the equal rights of other riparian owners—not at all by rights existing in others, because there are none; the whole right of use of the stream belongs, and belongs exclusively, and completely, to the riparian owners taken together. Often the exercise of riparian rights does not leave any water in the stream at all, and when it does, the riparian owners' right to have the stream as thus left so run and not to be interfered with by anyone, the State included, who is not a riparian owner, is absolute. This case was affirmed by this court on other and broader grounds. (*Hudson County Water Co.* v. *McCarter*, 209 U. S. 349.)

This case as a New Jersey authority is only opposed to our position in part, because it recognizes the distinction between public and private waters, and recognizes that if the State has any proprietary rights in private waters they are subordinate, or at least only equal to private rights therein.

4, Mason 397. Since those cases, it has been settled that under the common law, both in England and in the United States, the usufructuary rights to innavigable waters belong to the owners of the land bordering on them; that the rights of such owners in the water are in no way dependent upon its use; that such waters are in no proper sense *publici juris*, as, for instance, navigable waters are; that the water right is part and parcel of the title to land itself; and that title to such usufructuary right has the same origin as the title to the land.

Baron Parke thus states the law:

> The law as to flowing water is now put on its right footing by a series of cases, beginning with that of *Wright* v. *Howard*, * * * followed by *Mason* v. *Hill*, * * * and ending with that of *Wood* v. *Waud*, * * * and is fully settled in the American Courts: see *3 Kent's Comm.*, Lect. 52, pp. 439–445.
>
> The right to have the stream to flow in its natural state without diminution or alteration is an incident to the property in the land through which it passes; but flowing water is *publici juris*, not in the sense that it is a *bonum vacans*, to which the first occupant may acquire an exclusive right, but that it is public and common in this sense only, that all may reasonably use it who have a right of access to it, that none can have any property in the water itself, except in the particular portion which he may choose to abstract from the stream and take into his possession, and that during the time of his possession only:

see *5 B. & Ad.* 24. But each proprietor of the adjacent land has the right to the usufruct of the stream which flows through it.

Embrey v. *Owen*, 6 Ex. 352, 368; 20 L. J. Ex. 212.

In *Tyler* v. *Wilkinson* the question was as to the right of a mill owner to use the waters of the River Pawtucket, at a point where it is innavigable, as against riparian owners. Mr. Justice Story, as Circuit Justice, took occasion to review the law, and in the opinion he rendered briefly covered the whole subject of the origin and nature of riparian rights in nonnavigable waters. The case is the leading one on the subject. Mr. Justice Story said that he had read over all the cases which were cited at the bar, or which were to be found in Mr. Angell's work on watercourses, or which his own auxiliary researches had enabled him to reach. In part the opinion is:

> The natural stream, existing by the bounty of Providence for the benefit of the land through which it flows, is an incident annexed, by operation of law, to the land itself. * * * * * * Mere priority of appropriation of running water, without such consent or grant [of the riparian owners], confers no exclusive right. It is not like the case of mere occupancy, where the first occupant takes by force of his priority of occupancy. That supposes no ownership already existing. and no right to the use already acquired. But our law annexes to the riparian proprietors the right to the use in common, as an incident to the land; and whoever seeks to found an exclusive use,

> must establish a rightful appropriation in some manner known and admitted by the law. Now, this may be either by a grant from all the proprietors, whose interest is affected by the particular appropriation, or by a long exclusive enjoyment, without interruption, which affords a just presumption of right. By our law, upon principles of public convenience, the term of twenty years of exclusive uninterrupted enjoyment has been held a conclusive presumption of a grant or right.
>
> *Tyler* v. *Wilkinson*, 4 Mason 397, 401.

Further, as to innavigable waters being *publici juris:* The question is disposed of in the passage just cited from *Tyler* v. *Wilkinson*, by placing the ownership of the waters in the owners of the riparian land as "an incident annexed, by operation of law, to the land itself." It is specifically disposed of in the passage we have just quoted from *Embrey* v. *Owen*. Lord Denman, in *Mason* v. *Hill*, considered it fully and came to the conclusion that there was no foundation in the common law, or in the civil law either, so far as he could find, for the idea that such waters are open to occupancy, or that they are *publici juris*, except in the sense that no one owns the corpus of the water while it flows in its natural state.

After referring to many expressions in the law to the effect that flowing waters are *publici juris*, and the passage in Blackstone (2 Comm. p. 18): "Water is a movable, wandering thing, and must of necessity continue common by the law of nature; so that I

can only have a temporary, transient, usufructuary property therein; wherefore, if a body of water runs out of my pond into another man's, I have no right to reclaim it," Lord Denman says:

> None of these dicta, when properly understood with reference to the cases in which they were cited, and the original authorities in the *Roman* law, from which the position that water is *publici juris* is deduced, ought to be considered as authorities, that the first occupier or first person who chooses to appropriate, a natural stream to a useful purpose, has a title against the owner of land below, and may deprive him of the benefit of the natural flow of water.
>
> * * * * *
>
> In the *Digest*, Book 43, tit. 13, in public rivers, whether navigable *or not*, it appears that everyone was forbidden to lower the water or narrow the course of the stream, or in any way to alter it, to the prejudice of those who dwelt near. Tit. 12 distinguishes between public and private rivers; and in section 4 it is said, that private rivers in no way differ from any other private place.
>
> From these authorities, it seems that the *Roman* law considered running water, not as a *bonum vacans*, in which anyone might acquire a property; but as public or common, *in this sense only*, that all might drink it, or apply it, to the necessary purposes of supporting life; and that no one had any property in the water itself, except in that particular portion, which he might have abstracted from the stream,

and of which he had the possession; and during the time of such possession only.

We think that no other interpretation ought to be put upon the passage in *Blackstone*, and that the dicta of the learned judges above referred to, in which water is said to be *publici juris*, are not to be understood in any other than this sense; and it appears to us that there is no authority in our law, nor, as far as we know, in the *Roman* law (which, however, is no authority in ours), that the first occupant (though he may be the proprietor of the land above) has any right, by diverting the stream, to deprive the owner of the land below, of the special benefit and advantage of the natural flow of water therein.

Mason v. *Hill*, 5 Barnewell & Adolphus, 1, 23, 24.

Lord Cockburn in a Scotch case said:

I know nothing more rudimental in our law, than that private rivers are the property of those through whose lands they flow. This property is qualified, no doubt, in various ways, in favour of the other heritors; the object being, that each may enjoy the stream in his turn. But there is no restriction in favour of strangers. It is solely on behalf of the other owners of the water-side ground. Nor is it a mere privilege of using the stream as it passes. It is a right of property in the stream itself. Accordingly, where a river runs its entire course through the land of a single person, he, as the sole proprietor, may do with it as he pleases; as a plurality of landowners may, if all their lands adjoin it, and they all agree. He or they may extinguish it, if they can. A river is, in

this respect, exactly like a private lake surrounded by one estate, which the landowner, if not restrained by distant heritors whose streams it may feed, may drain. The water being current or still, makes no difference on the legal principle.

Ferguson v. *Shirreff*, 6 Dunlop, 1355, 1374 (Scot's Rev. Reps.)

(4) Water rights in innavigable waters being vested rights in real property, the State has the same and no greater control over them than over vested rights in land. Regulation under the police power should not be confused, as it often is, with rights of property in the State or any denial of property rights in the individual.

Undoubtedly the States have the power to control individuals in their use of water. This right of the State may not be confined to the police power, but it can not go beyond that power and the right of eminent domain. Whatever the power is, it is limited by the provisions of the fourteenth amendment protecting vested rights. The power itself is the same as that which the State has over vested rights in lands. Water rights, as we have seen, under both the appropriation and the riparian doctrines, are vested rights in real property, which can be lost only by grant, condemnation, prescription, or abandonment.

The ways in which this power of the State is exercised, of course, will differ in accordance with the kind of property the use of which is to be affected or controlled. Thus, we have regulations limiting the use of land for the public good that would not be

at all applicable to water, and, *vice versa*, we have regulations concerning water that could not apply to land. Of this character are the administrative rules and the means of enforcing them, by which officers appointed by the courts, or provided for by statute, see to it that gates are opened and shut so that the waters will be apportioned to the various owners of rights therein, according to the decrees of the courts by which they have been defined and established. This is a clear exercise of the police power, and is so held by the courts.

Wiel, Water Rights, 3d ed., p. 196, 197:
Roberson v. *People*, 40 Colo. 119, 124.
Broad Run Co. v. *Duel Co.*, 47 Colo. 573, 579.
Combs v. *Farmers Co.*, 38 Colo. 420, 428.

(5) The argument based on the necessities of the arid region examined. It wrongly assumes that the riparian system is not suited to western conditions and that, therefore, the States can dispose of the Federal property in water.

Those who would have the Federal property in non-navigable waters held to be in the States argue that the riparian system which puts the title to the use of such waters in the owners of the lands which have access to them is not suited to western conditions. We think it sufficient here to point out that the main principle of the riparian system is equality of right between the riparian owners; that they among them own the entire right of use of the stream; that any proper use under the circumstances, including, of course, irrigation, is permitted; that rights exactly like

appropriation rights can be and frequently are created by grant or condemnation of rights of the riparian owners; that the appropriation system, so called, is not so much a system of owning and using rights as it is a means of acquiring them; that it is an open question whether the correlative rights of the riparian system are not better suited to an irrigation community than the sometimes more definite and less related appropriation rights; and finally, that both classes of rights are now being created out of and logically rest, under our theory, upon the original Federal ownership of riparian rights (as will be shown hereinafter more in detail) and that the argument for State ownership is merely one that it would be better to allow the States to dispose of this class of Federal property and is as applicable to lands as to water.

(6) The fundamental principle of water law, that the corpus of water can only be the subject of ownership while in possession, and that, therefore, water itself in its natural state is owned by no one, has no effect upon the question of whether the title to the usufructuary right therein belongs to the State as a part of its sovereignty.

Many of those who argue that the origin of water rights in nonnavigable waters is in the States try to find support from this principle, arguing that because the corpus of water out of possession is not property at all, being in the so-called negative community like air or animals *ferae naturae*, the ownership of the right of use—the real property right of value—must in some way belong to the State or have its origin in some sort of State ownership. Obviously the prin-

ciple applies to all waters and, equally obviously, it neither supports nor denies State ownership of the real property usufructuary right.

II.

Water rights now vested in others derive their existence, like titles to land, from the acts of Congress. All interest in water not so granted necessarily remains in the United States. The acts grant nothing to the States, and ratification of State constitutions asserting State ownership of water does not divest the United States of its property rights therein.

(1) The earliest acts of Congress affecting innavigable waters—They show full consciousness of power to deal with such waters on the public lands.

Section 2476 of the Revised Statutes provides:

> All navigable rivers, within the territory occupied by the public lands, shall remain and, be deemed public highways; and in all cases where the opposite banks of any streams *not navigable* belong to different persons, the *stream* and the bed thereof shall become common to both.

This section is but a continuation of early statutes on the subject (acts of May 18, 1796, 1 Stat. 468; March 3, 1803, § 17, 2 Stat. 235; Feb. 20, 1811, § 3, 2 Stat. 642; and March 3, 1811, § 12, 2 Stat, 666), and is referred to in *Railroad Co.* v. *Schurmeir*, 7 Wall. 272, 289; *Scott* v. *Lattig*, 227 U. S. 229, 242; and *Hardin* v. *Shedd*, 190 U. S. 508, 519.

These acts show that from the earliest times Congress has had clearly in mind the difference that

exists in the relation of the Federal Government to navigable and innavigable waters. They likewise show that Congress has been fully conscious of ownership in the United States of the innavigable waters on the public lands and of its own power to say how these waters shall be disposed of.

Those of the acts preceding R. S. 2476, which affected lands beyond the Northwest Territory (acts of Feb. 20, 1811, and Mar. 3, 1811), omitted the above clause referring to innavigable waters. Since the passage of the act of July 26, 1866, which we shall now discuss, the disposition of such waters on the public lands has been controlled by this latter act and by the local laws and customs used as its subordinate instrumentalities.

(2) History and nature of the act of July 26, 1866, granting water and mining rights and rights of way. Purpose and effect of its adoption of local laws and customs.

(a) The occasion of this legislation was the extensive occupation and exploitation of the public lands in the West following the discovery of gold in California. The need was to legalize appropriations of mineral land, rights of way, and water rights already made under local customs and laws, and to provide for the future acquisition of rights of the same character in the same manner.

The occasion and history of this legislation, with specific reference to water rights and waterways, are sufficiently shown by the opinions in—

Jennison v. *Kirk*, 98 U. S. 453.
Atchison v. *Peterson*, 20 Wall. 507.

Basey v. *Gallagher*, 20 Wall. 670.
Broder v. *Water Co.*, 101 U. S. 274.
See also:
1 Wiel on Water Rights, 3d ed., secs. 66 *et seq.*, 92 *et seq.*
1 Kinney on Irrigation and Water Rights, 2d ed., secs. 596 *et seq.*, 611 *et seq.*, 636 *et seq.*

Almost immediately upon the discovery of gold in 1848 a large population sprang up in California and Nevada and the other western Territories. Mining, milling, agriculture, and other industries quickly grew to great importance and large communities dependent upon these activities of the miners and settlers were established. The country thus so suddenly occupied was up to that time a vacant wilderness, most of which had been but lately acquired from Mexico. There was no general mining law, the lands were unsurveyed and there was no efficient statute under which the Government title to land of any character could be acquired. *Wiel, Water Rights*, 3d ed., p. 92.

The miners and settlers and the residents of the towns were alike technical trespassers on the lands of the United States. They took out the gold, set up mills for the reduction of ores, cut the timber, and engaged in agriculture. For all of these purposes the use of water was essential, and they diverted it from the streams. All this was done under orderly and firmly established codes of rules made by the miners' meetings in the various communities, the decisions of courts, and later by State and

territorial legislation. The law that thus grew up was purely a law of possessory rights made to regulate the acquisition and holding of the Government property by the miners and settlers among themselves and as against each other. It was all subject to the underlying rights and, at that time, unexercised powers of the United States as the owner of the property affected. As to mineral land, the vein or lode was recognized as the thing discovered, and the thing of value; and so the rules gave title to that rather than to so much land and allowed the following of the vein on its dip even though doing so involved going outside of the limits of the surface claim extending vertically downward. As to water, the lands from which it was taken, the lands occupied by the ditches and flumes, and the lands where it was used, whether for milling ores, washing the gold out of the gravel of the hillsides and stream beds, or for irrigation, were all until such occupancy vacant public lands.

If the miner or farmer felt free to appropriate the vein of mineral that he had discovered or the land that he wanted to farm, he felt equally free to take water for those purposes from the most convenient source. The fact that he thereby took the waters from another piece of Government land bordering on the stream made no difference under the circumstances. He could take that land, too, if he wanted it. The rules, therefore, permitted the diversion of water for any useful purpose and recognized the first appropriator's priority of right just as they recognized

the priority of the discoverer and first claimant of a vein of mineral. Throughout this period, during which these possessory rights had come to be of enormous value and had finally been held by the courts to have, between the appropriators, practically all the dignity of freeholds (*1 Wiel, Water Rights*, secs. 89 and 90, p. 97 *et seq.* and cases cited), it was realized that the underlying legal title was outstanding. The courts in the cases involving these rights were careful to refer to the paramount Government title. They usually did so by saying that the rights on which they were passing were good "except as against the United States." (*Wiel, Water Rights*, sec. 91, p. 102, and cases cited; *Atchison* v. *Peterson*, 20 Wall. 507, 510; *Basey* v. *Gallagher*, 20 Wall. 670, 681; and *Sturr* v. *Beck*, 133 U. S. 541, 552).

The uppermost question in everyone's mind was what Congress would do and what effect whatever action Congress might take would have upon these rights. When Congress provided a means for the acquisition of the Government title, would the Government's grant of mineral land cut off the right of the miner whose vein ran under that land from following it and abstracting the minerals? Would a grant of land over which a ditch or flume or road ran except a right of way for the benefit of the original builder and present occupier, and would a grant of riparian land or of all the riparian land on a stream carry with it the right to stop the use of water by appropriators who had taken it, often to a great distance, and put it to nonriparian uses? To meet this situation the act of

1866 and the supplementary act of 1870 were passed. Congress had already provided adequate means for the acquisition of the Government title to agricultural lands by passing the homestead act in 1862.

(b) These acts of 1866 and 1870 examined—Their interpretation by the courts.

The relation of these two acts to water rights and waterways was precisely the same as their relation to the mineral lands. The first act, July 26, 1866 (14 Stat. 251), was styled merely "An act granting the right of way to ditch and canal owners over the public lands, and for other purposes"; but it was in reality the first general mining law of the United States. Its first section declared that "the mineral lands *of the public domain*" should be free and open to exploration and occupation by citizens, etc., subject to such regulations as may be prescribed by law and subject also to the local customs or rules of miners in the several mining districts, *so far as the same may not be in conflict with the laws of the United States.*

Sections 2 to 4 provided for the locating, entering, and patenting of lode claims occupied and improved "according to the local custom or rules of miners" in the mining district "so extended laterally or otherwise as to conform to the local laws, customs, and rules of miners," giving them the right to follow the vein or lode to any depth "although it may enter the land adjoining, which land adjoining shall be sold subject to this condition" (sec. 2), authorizing the surveyor general to vary the form from rec-

tangular "to suit the circumstances of the country and the local rules, laws, and customs of miners," with a proviso that no location should exceed a certain length for each locator (sec. 4).

Section 5 provided:

> That as a further condition of sale, *in the absence of necessary legislation by Congress*, the local legislature of any State or Territory may provide rules for working mines involving easements, drainage, and other necessary means to their complete development; and those conditions shall be fully expressed in the patent.

Section 8:

> That the right of way for the construction of highways over public lands, *not reserved for public uses*, is hereby granted.

In section 9 we find substantially and almost in words R. S. section 2339. It was as follows:

> That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid is hereby acknowledged and confirmed: *Provided, however*, That whenever, after the passage of this act, any person or persons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the

> public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Section 10 allowed settlers on nonmineral lands, which had been excluded from survey as mineral, to acquire them under the preemption and homestead laws.

The act of July 9, 1870 (16 Stat. 217), amended the act of 1866 by adding six new sections, numbered 12 to 17, inclusive. Section 12 extended the law, with certain modifications, to placer claims. Section 13 provided that where claims had been held and worked "for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated" the right to patent should be deemed established. Sections 14 to 16 dealt with land office procedure, fees, and surveys. Finally, section 17, which has been modified into R. S. section 2340, *supra*, declared:

> That none of the rights conferred by sections five, eight, and nine of the act to which this act is amendatory shall be abrogated by this act, and the same are hereby extended to all *public lands* affected by this act; and all patents granted, or preemption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, *as may have been acquired under* or recognized by the ninth section of the act of which this act is amendatory.

The sections 5, 8, and 9 here referred to are the sections allowing local legislatures, in the absence of

legislation by Congress, to provide rules, "for working mines involving easements, drainage, and other necessary means to their complete development," the section granting rights of way over public lands for highways, and the section concerning water rights and ditches. R. S. 2339.

The mining features of this act were crude and were repealed and their place taken by the more detailed act of May 10, 1872 (17 Stat. 91.)

In this latter act, however, the policy adopted by the former of favoring local laws and granting mining rights in accordance therewith is adhered to. The water features of the original acts have been preserved and are still in force.

That the act of 1866 provides a means for the future acquisition of rights, water as well as mining is the settled holding of the courts. That it looks to the future as well as the past is made perfectly clear by the act of 1870 through the use of the words: "Such water rights, as may have been *acquired under* or recognized by the ninth section of the act of which this act is amendatory." Two classes of rights are under consideration and provided for: Rights existing prior to the passage of the act and rights acquired afterwards and so under the express authority of the act itself.

Jacob v. *Lorenz*, 98 Calif. 332, 335.

Beaver Brook v. *St. Vrain*, 6 Colo. App. 130, 138.

1 Wiel, Water Rights, 3d ed., sec. 99, p. 116.

Long, Irrigation, 2d ed., sec. 74, p. 134.

Without unduly extending this analysis or resorting to too extensive citations of authority, we wish to invite still further attention to certain of the salient features of this legislation and its interpretation, as it is, in our view, the foundation of all water rights in the Western States to-day and provides a solution and, we think, the only solution of the problem of interstate streams.

It will be seen that this act of 1866, while treating principally of mining, governs also water rights and rights of way for ditches, canals, and highways. These several subjects are handled together and in the same way. As to each the act gives the fundamental title to those who already had possessory rights, and provides a way by which grants of mining and water rights may be obtained in the future. Mineral lands are held open to "exploration and occupation," and he who occupies is given the right to take the other steps which lead to a grant. Water rights are *protected and preserved* to whomever has *possessed* them. Local laws, rules, and customs are used in both cases to define the right and provide the course that must be followed to acquire it. The mineralized vein is recognized by the act, as it was before by the customs of the miners, as being the thing appropriated, and so the right is given to follow it regardless of the surface limits of the claim extending vertically downward, which ordinarily define the extent of land holdings. In the field of water rights, again in accordance with local customs, the one who first "appropriates,"

even for use on nonriparian lands, is given the better right. Both as to mining and water, however, the rights granted are only such as any proprietor of the whole property involved could grant, and the rule of priority is only that which necessarily follows from successive conveyances of defined parts of a whole.

Further, it should be observed that under this act the proprietor, the United States, in a way holds its landed estate for conveyance in three classes—mineral rights, water rights, and what may be called, for convenience, ordinary land rights. It holds all of these rights for conveyance separately or together, as the case may be. Consequently, riparian rights pass or not under a patent of riparian land, generally speaking, according to whether or not the riparian doctrine or the appropriation doctrine is the rule in the locality where the land is situated. Congress has provided that it shall be otherwise in the Black Hills Forest Reserve in South Dakota (34 Stat. 233, 234).

It is well understood that the local rules, whether found in miners' customs, court decisions, or legislative acts, were adopted merely to supplement the particular provisions and fundamental conditions of the act, in order to fit it to local conditions, including local preferences, and avoid unnecessary complexity and volume in the act itself. This plan of adopting local laws or rules as the laws and rules of Congress is familiar enough. It is seen in the legislation defining crimes on reservations under exclusive jurisdiction of the General Government; in the con-

formity provisions governing the Federal courts in common-law cases; in various laws for the taking of affidavits, etc. Illustrations might be greatly multiplied.

As we have already said, the local laws, customs, etc., in respect of mining claims, retain their function under the mining law as it is to-day. They depend, of course, upon the express permission of Congress therein contained.

> State statutes in reference to mining rights upon the public domain must therefore be construed in subordination to the laws of Congress, as they are more in the nature of regulations under these laws than independent legislation.
>
> *Lindley on Mines*, 2d ed., sec. 249.

Quoted with approval in *Butte City Water Co.* v. *Baker*, 196 U. S. 125.

Their constitutionality, challenged in the case last cited, was upheld upon the ground that a delegation of authority to adopt "minor and subordinate regulations" concerning the disposition of the public domain is not a delegation of strictly legislative power. See also *Clason* v. *Matko*, 223 U. S. 646, 654.

It is somewhat astonishing to find the *Broder case* (101 U. S. 274) and *Jennison* v. *Kirk* (98 U. S. 453, 456) cited in Colorado's brief as authority for the idea that the act of 1866 recognized an independent title or power in the States. They hold exactly the reverse.

The act is a grant of rights belonging to the United States. This court in *Broder* v. *Water Co.*, *supra*, 101 U. S. 274, 275, construing the right of way part of the ninth section of the act says that the same is an "unequivocal grant." The Circuit Court for the District of Nevada in *Union Co.* v. *Ferris*, 2 Sawy. 176, 184, held:

> The policy of this enactment (sec. 9, act of 1866), so far at least as it relates to agricultural districts, may be doubtful but it is the law of the land, and the courts must carry out what appears to be the intention of the legislature (Congress) as therein expressed. And that, as indicated by the act, appears to be to grant to the owner of possessory rights to the use of water under the local customs, laws, and decisions, the absolute right to such use, which the government alone could grant.

The text writers so contrue it. (See *1 Wiel, Water Rights*, 3d ed., sec. 97, p. 113; sec. 155, p. 177 *et seq.*; *Long, Irrigation*, 2d ed., sec. 74, p. 134.)

The grant is made directly to the individual appropriator. It takes effect upon his bringing himself within its terms by complying with the local laws. No patent follows as in the case of mining claims, but the title passes by virtue of the statute itself and compliance with it, as is the case with grants of rights of way.

> The language of this act (act of 1866) makes the right a confirmation *in praesenti*, as to the claims included (referring to water rights), without any preliminary proceeding to obtain

> a title, as in the case of a mining claim. A grant conferred by act of Congress is the highest source of title known to our laws.
>
> *Yale, Mining and Water Rights*, p. 380.

The law of water rights in California and the numerous States which have followed her lead is based squarely upon the Federal title. These States are California, Kansas, Montana, North Dakota, South Dakota, Washington, Nebraska, Oregon, and possibly Oklahoma. (*1 Wiel, Water Rights*, 3d ed., p. 226.) Appropriation rights in those States are explicitly held to be derived from the United States by direct grant under this act. Riparian rights, which there exist side by side with rights by appropriation, are held by the courts to be derived from the United States under grants by it of riparian lands.

> It has never been held that the right to appropriate waters on the public lands of the United States was derived directly from the State of California as the owner of innavigable streams and their beds. And since the act of Congress (1866) granting or recognizing a property in the waters actually diverted and usefully applied on the public lands of the United States, such rights have always been claimed to be deraigned by private persons under the act of Congress, from the recognition accorded by the act, or from the acquiescence of the general government in previous appropriations made with its presumed sanction and approval.
>
> *Lux* v. *Haggin*, 69 Calif. 255, 338.

> An appropriator of water under these circumstances, and while the land which he subjects to his necessary uses continues to be a part of the public domain, is a licensee of the general government; but when such a part of the public domain passes into private ownership it is burdened by the easement granted by the United States to the appropriator, who holds his (water) rights against this land under an express grant.
>
> *Smith* v. *Hawkins*, 110 Calif. 122, 125.

The Supreme Court of Washington, referring to this act, said:

> It was for the purpose of protecting the rights of appropriators of water for beneficial uses on the public lands which had vested and accrued, by virtue of local customs, laws and decisions of the courts, that the ninth section of the act of Congress of July 26, 1866, the substance of which is included in section 2339 of the Revised Statutes, was enacted. It was apparent to congress, and indeed to everyone, that neither local customs nor state laws or decisions of state courts, could vest the title to public land or water in private individuals without the sanction of the owner, viz; the United States.
>
> *Benton* v. *Johncox*, 17 Wash. 277, 289.

In Oregon it is held that "an appropriation of water is a grant by the general government to the settler of the right to its use."

> *Morgan* v. *Shaw*, 47 Oreg. 333, 337.

A water right can therefore be acquired only by the grant, express or implied, of the

owner of the land and water. The right acquired by appropriation and user of the water on the public domain is founded in grant from the United States government as the owner of the land and water; such grant has been made by Congress.

Smith v. *Denniff*, 24 Mont. 20, 21.

See also *Barkley* v. *Tieleke*, 2 Mont. 59, 64.

To the same effect see:

Cruse v. *McCauley*, 96 Fed. 369, 373–374.

Howell v. *Johnson*, 89 Fed. 556, 558.

Colorado and the other pure appropriation States, and the Territory of Alaska (Alaska, Arizona, Colorado, Idaho, New Mexico, Nevada, Utah, and Wyoming; *1 Wiel, Water Rights*, 3d ed., p. 226), endeavor to find some basis for water rights other than the Federal title. The arguments advanced for their position we have already examined under a different head. In these States water rights are identical with appropriation rights in California and the other dual system States, and, of course, are derived, as they are there, from the United States by grants under this act, unless indeed the effectiveness of that legislation, so far as it covers water, came to an end upon the admission of the States, a proposition already herein considered and, we think, refuted.

(3) Subsequent acts of Congress contradict the theory that Federal ownership has been abdicated.

Since the act of 1866 there are a number of statutes reiterating the policy of Congress to permit the appropriation of water and leave it largely

within the control of the local regulations. These laws do not bear out the assertion that the Federal interest in nonnavigable water has been transferred to the States, and still less do they lend support to the theory advanced in Colorado's brief that Congress recognizes the States as having any ownership of or control over such water independent of a transfer from the Federal Government.

It is to be noticed that in these later declarations by Congress concerning water there is evident not only a consciousness of the power to deal with this subject without State intervention, but in some instances an actual exercise of the power itself. It is as impossible to gather from these acts that Congress intended by them to divest the United States of its interest in water as it is to obtain the impression that Congress in legislating believed it was without power in the matter. All of these acts merely adhere to the general principle of the act of 1866 as one of convenience. They favor the laws of the Territories quite as much as those of the States and in some instances they give rules independent of either. On this subject see the discussion and citations in *Kinney on Irrigation and Water Rights*, 2d ed., sec. 637.

The desert land law of March 3, 1877 (19 Stat. 377), contains this proviso:

> *Provided, however*, That the right to the use of water by the person so conducting the same, on or to any tract of desert land of six hundred and forty acres shall depend upon bona fide prior appropriation: and such right shall not

> exceed the amount of water actually appropriated, and necessarily used for the purpose of irrigation and reclamation: and all surplus water over and above such actual appropriation and use, together with the water of all, lakes, rivers and other sources of water supply upon the public lands and not navigable, shall remain and be held free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights.

It has been suggested that this is an irrevocable "dedication" to the States, but a glance at the whole provision will convince one that it will not bear such a construction. The proviso makes no mention of the States and does not even refer to the local laws and customs. Congress itself undertakes to lay down the essential conditions of the water right which the desert entryman may acquire: It "shall not exceed the amount of water actually appropriated and necessarily used for the purpose of irrigation and reclamation," and the free right of appropriation is made coextensive with the public lands in the States and Territories named. The claimed dedication to the States is no more than a declaration that it was not intended by the act to withhold from free appropriation and use by the public (as theretofore under the act of 1866) for "irrigation, mining, and manufacturing purposes" surplus water over and above such actual appropriation and use, under the act, and over and above that already held by virtue of "existing rights." The declaration is similar to that in the

mining law of 1872 (17 Stat. 91): "All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase * * *."

In both instances Congress states its present policy and leaves itself free to change it at will. The language of the desert-land law is that of a proprietor dealing with its own property.

The case of *Hough* v. *Porter*, 51 Oreg. 318, is sometimes cited as sustaining the theory that this act is a dedication of water to the States. The learned and exhaustive opinion of Mr. Justice King fully sustains, and, indeed, depends throughout, upon the proposition that the United States, as the owner of the public domain, is quite competent to dispose of the waters thereon, together with the land, or to dispose of each separately, or to dispose of one and retain the other. The question examined was whether various owners who had obtained patents for riparian lands from the United States *after* the desert-land law became effective had thus acquired full riparian rights in the waters, no reservation in that regard being expressed in the patents. The court holds that such rights (except for domestic and other purposes not named in the act) were withheld from disposition with the land by reason of this declaration of the desert-land law, which the opinion in some places treats as amounting to a

reservation by the Government and in others as a dedication by the Government to "the public." To hold that there was actually a dedication and that the Government had thus at one stroke parted with all its interest in the unappropriated waters was quite unnecessary to the decision; for, obviously, if the intent of the declaration was, as it may well have been (*Williams* v. *Altnow*, 51 Oreg. 275; *United States* v. *Rio Grande Dam Co.*, 174 U. S. 690; *Gutierres* v. *Land Co.*, 188 U. S. 545), to set the waters apart from the land for acquisition by appropriation only, subsequent land patents would not operate to give riparian rights, whatever might be their terms as drafted in the department.

See *1 Kinney, Irrigation*, pp. 1091, 1095.

It is this idea of the severance of the water from the land by Congress (see *Wiel, Water Rights*, p. 222) and the withholding of it for appropriation, we take it, that was said to be plausible in the reference to *Hough* v. *Porter* in *Boquillas Cattle Co.* v. *Curtis*, 213 U. S. 339, 344. The reference is as follows:

> The opinion that we have expressed makes it unnecessary to decide whether lands in the arid regions patented after the act of March 3, 1877, c. 107, 19 Stat. 377, are not accepted subject to the rule that priority of appropriation gives priority of right by virtue of that act construed with Rev. Stat. sec. 2339. The Supreme Court of Oregon has rendered a decision to that effect on plausible grounds.

Wholesale dedications by the Federal Government to the States are not to be implied or found in words perfectly consistent with a different intention. *United States* v. *Oregon & C. R. Co.*, 186 Fed. 861, 893; *Oregon Railway* v. *Oregonian Railway Co.*, 130 U. S. 1, 26; *Slidell* v. *Grandjean*, 111 U. S. 412, 437.

It should be noticed further that in this proviso Congress was careful to confine its legislation to water "*upon the public lands*" and "*not navigable*," showing that it fully realized the distinction the law makes between public and private waters and that the relation of the United States to innavigable waters is that of a proprietor.

The clause in the timber and stone act of June 3, 1878 (20 Stat. 89), as follows:

> That none of the rights conferred by the act approved July twenty-sixth, eighteen hundred and sixty-six, entitled "An act granting the right of way to ditch and canal owners over the public lands, and for other purposes," shall be abrogated by this act; and all patents granted shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under and by the provisions of said act; and such rights shall be expressly reserved in any patent issued under this act—

protects the water rights and rights of way "conferred by" the act of 1866 and declares that all patents shall be subject to such rights "acquired under and by the provisions of said act." This is a clear

recognition that the source of water rights is the United States, and is very far from giving support to the idea that such rights are the issue of a State law, or that the power to grant them has been devolved to the States. It also shows that Congress had clearly in mind that "vested and accrued" water rights in the public-land States become such by virtue of the act of 1866 with the act of 1870, some of the language of which is used in this later legislation.

The act of March 3, 1891 (26 Stat. 1095, sec. 18), granting rights of way for irrigation purposes, declares that the privilege granted shall not be construed to interfere "with the control of water for irrigation and other purposes under authority of the respective States *or Territories*." This means the authority to control the appropriation of water on the public lands conferred by the act of 1866. The Territories are put on the same plane with the States.

Colorado's brief on rehearing (vol. 1, p. 122) points out that the act of August 18, 1894 (28 Stat. 422), known as the Carey Act, grants to public-land States each a million acres of land or so much as the State may cause to be irrigated, reclaimed, and occupied. We do not see what bearing the fact that under the act the State is to cause the lands to be irrigated has upon the questions here. The State receives the grant upon condition that it will reclaim the land in the manner provided by the act. It is required to cause it to be irrigated, reclaimed, occupied, and not less than 20 acres of each 160-acre tract cultivated

by actual settlers "as thoroughly as is required of citizens who may enter under the said desert-land law."

The forest-reserve legislation of June 4, 1897 (30 Stat. 11, 36), contains a clause which provides that—

> All waters on such reservations may be used for domestic, mining, milling, or irrigation purposes, under the laws of the State wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder.

Here the uses of water intended to be allowed are such as may be practiced consistently with the objects of the reservation and by ways authorized by Congress. This provision concerning their use is merely a modified reiteration of the consistent policy of Congress, to which we have already given some attention, to leave the matter of defining and controlling the uses of water as far as possible to the local laws.

There were persons "residing within the boundaries of such reservation" owning "property or homes" there. Others were permitted to enter for "proper and lawful purposes," including mining and milling, if they complied with the rules and regulations. *United States* v. *Grimaud*, 220 U. S. 506. The situation called for the use of water, and the object of the provision under discussion was to recognize the legitimacy of the use for the purposes specified,

if consistent with the laws of the State or other laws of the United States.

An act approved February 26, 1897 (29 Stat. 599), opened to use reservoir sites which had been reserved by the General Government, with the proviso that *charges* for the water should be "subject to the control and regulation of the respective States and Territories," etc.

On March 2, 1897, Congress passed a special act (29 Stat. 603) restoring to the public domain a reservoir site, theretofore reserved, and authorizing the Secretary of the Interior to sell it to whomever might buy it for the building and maintaining of a reservoir there. It contained a proviso that the act should not be construed to "deprive the State of Colorado of the control of the water in any reservoir which may be constructed on this site by any person or corporation or association, under the regulations provided by the State laws in such cases."

Under the first of these acts Congress rates the Territories and the States on a par and makes it clear that the reservoir owner will not be allowed to fix charges for the water he stores upon any claim that State and Territorial laws respecting such matters do not affect him. The second act preserves to the State of Colorado the regulative control of the water that may be stored in the reservoir. This act is quoted in Colorado's brief, volume 1, page 122, but how it can be considered a recognition of the State's inherent or acquired ownership of innavigable waters, we do not see.

The reclamation act of June 17, 1902 (32 Stat. 388), inaugurates a new policy by which the United States itself undertakes the development of its land and water resources in the arid States, although development by private enterprise or by State action (under the Carey Act, 28 Stat. 422) is not excluded. Consequently the right of appropriators under the act of 1866, through the subordinate instrumentality of the State laws, is carefully preserved. Money received from the sale of public lands is devoted to "the construction and maintenance of irrigation works for the storage, diversion, and development of waters for the reclamation of arid and semiarid lands." Apart from any consideration of whether this policy would have been adopted if Congress had believed that the waters, indispensably necessary to make these undertakings a success, belonged to the States and so were subject to withdrawal by them at any time, the act shows that the water is assumed to be subject to the use and disposition of the Government. In section 5 it is provided that—

> No right to the use of water for land in private ownership shall be *sold* for a tract exceeding one hundred and sixty acres to any one landowner, and no such *sale* shall be made to any landowner unless he be an actual *bona fide* resident on such land * * * and no such right shall permanently attach until all payments therefor are made.

As rights by appropriation become vested only by beneficial use, it would seem from this that it

was not thought that the Government, by undertaking these projects, would become merely a public-ditch owner with no vested right in the water which the ditches would carry.

Section 8 is as follows:

> That nothing in this act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this Act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof: *Provided*, That the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated and beneficial use shall be the basis, the measure, and the limit of the right.

The first part of this section is simply a recognition of vested rights acquired under the act of 1866, and a preservation of the existing systems of water law in the States and *Territories* which have grown up under that act. (See *Gutierres* v. *Albuquerque*, 188 U. S. 545, 552–554.) The direction of the Secretary of the Interior to "proceed in conformity with such laws," is meant like the conformity provisions in other federal statutes to harmonize fed-

eral activity with that which must, by compulsion of State law, go forward, if at all, under local procedure, deriving its authority from the Federal act of 1866. The concluding clause is significant: "That the right to the use of water acquired under the provisions of this act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right." Here again, we see that the State and Territorial laws are rated on a par and that Congress itself undertakes to create water rights and define them. A water right acquired by appropriation and beneficial use in irrigation is not usually appurtenant to the land irrigated. *1 Wiel, Water Rights*, 3d ed., sec.550.

Colorado's brief (vol. 1, p. 119 et seq.) cites the acts that we have been discussing, with the exception of those of May 10, 1872, June 3, 1878, and June 4, 1897, as showing that Congress in them has recognized and affirmed the proposition laid down in the brief that the States have full, and as we understand the brief, the same sovereign jurisdiction and control over all waters within their borders, innavigable as well as navigable. The distinction which the law makes between these two classes of waters is not discussed there or elsewhere in the brief, and no attempt is made to point out how these Federal statutes recognize any such doctrine or are in any way inconsistent with Federal proprietary ownership of the innavigable waters.

In concluding this topic we observe that the legislation of Congress with regard to water rights all

centers upon and is intended to preserve the policy adopted in the act of 1866 of granting the right to use the unreserved proprietary waters of the United States to individuals in accordance with local systems of water-right law.

The right-of-way parts of the act of 1866 under which appropriators of ways were granted easements over the public lands without formal action or coming into contact with Federal executive officers have, for the most part, given way to a more exact system created by the acts of 1891 (26 Stat. 1095) and 1901 (31 Stat. 790), considered by this court in the late case of *Utah Power & Light Co.* v. *United States*, 243 U. S. 389. These later laws in general adopted a plan for granting permits or licenses under executive regulation instead of easements without regulation and substituted direct dealing between the Federal Government and the grantee for the loose indirect process permitted by the act of 1866.

Had such a plan been adopted as to water rights, or had patents for these rights been given as in the case of mining rights, is it likely that the proprietary right of the Government to the waters would ever have been questioned, or at any rate questioned at a later period or more persistently than was its title to the public lands? It is the long continuance of subordinate State control, under a system that involves no recourse to the source of power, that has caused the fact that such control is subordinate, sometimes to be lost sight of.

(4) Ratification of State constitutions asserting State ownership of waters does not divest the United States of its property rights therein.

The provisions of the constitution of Colorado may be taken as fairly representative of those contained in the constitutions of the other States having provisions asserting ownership of water, and are as follows:

> The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the State, subject to appropriation as hereinafter provided.
>
> Colo. Constitution, Art. XVI, sec. 5.
>
> The right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes.
>
> Colo. Constitution, Art. XVI, sec. 6.

The contention is that it was the duty of Congress when creating the States to see to it that their constitutions asserted no ownership in, and assumed no control over, property of the United States which it was not the intention of Congress to convey to the

States; and that if those constitutions when finally adopted contained provisions of that character they must be taken as effective congressional grants of such property to the States.

Considering the purpose to be accomplished and the part that Congress plays in creating a State, this seems an astonishing position to take. What Congress does is to bring into being a new State sovereignty to take a place with the others already existing. The purpose is the creation of a State and nothing more. If it grants property to the State at the same time, as it generally does, it does so specifically by an act of Congress.

The constitution may be supervised and reviewed by Congress or it may not. That of Colorado was not and that of Oklahoma was.

Mr. Justice Lurton, in speaking for this court of the Oklahoma constitution, said:

> A constitution thus supervised by Congress would, after all, be a constitution of a State, and, as such, subject to alteration and amendment by the State after admission. Its force would be that of a state constitution and not that of an act of Congress.

Mr. Kinney, in his work on Irrigation, finds this argument for State ownership of water wholly without merit.

> *1 Kinney, Irrigation*, 2 ed., sec. 388, p. 660.

(5) The question whether the United States or the States own the water of innavigable streams in the West has never been directly passed upon by this court. The cases support Federal ownership.

As we have already shown, the California law of waters is based squarely upon the Federal title and the act of 1866; and the California cases, in this respect, are followed in the other States that have not adopted the pure appropriation system, while in those States which have adopted that system the courts for the most part deny the Federal title and seek to find the origin of all titles to water in the State. The question has never been directly passed upon by this court; however, in a number of cases this court has incidentally considered it and expressed the view that the United States has a title and right to the waters on its public lands wholly independent of State permission. In no case that we have found has this court given countenance to the contrary theory.

None of these cases lends support to the theory that the States have any inherent power to dispose of or affect the innavigable waters flowing on the public lands and all of them accord perfectly with the theory of water law, based upon the Federal title, that we have been maintaining. The dictum in the Rio Grande Dam case, placing limitations upon the States as to such waters, stands not only unmodified, but is supported by the later decisions. The text-book writers who discuss the subject at all, so far as we have found, are unanimous in their support

of the federal title. *Weil, Water Rights*, 3 ed., pp. 183, 184, 223; *2 Kinney, Irrigation*, 2 ed., sec. 640; *Long, Irrigation*, sec. 74, p. 134.

The cases are:

Atchison v. *Peterson*, 20 Wall. 507.
Basey v. *Gallagher*, 20 Wall. 670.
Sturr v. *Beck*, 133 U. S. 541.
United States v. *Rio Grande Dam and Irrigation Co.*, 174 U. S. 690, 704.
Gutierres v. *Albuquerque, etc., Co.*, 188 U. S. 545.
Kansas v. *Colorado*, 206 U. S. 46.
Winters v. *United States*, 207 U. S. 564.
Boquillas Land & Cattle Co. v. *Curtis*, 213 U. S. 339.

Kansas v. *Colorado, supra*, decided in 1907, is not an authority to the contrary of the position taken in *Rio Grande Dam & Irrigation Co.* v. *U. S.* The Government there sought to maintain its intervention upon the broad theory that because the policies of Colorado and Kansas, respecting the use of the waters of the Arkansas, were conflicting, and because neither State was competent to regulate that use outside of her own borders, the entire power of regulation must be held to reside in the United States. Such a Federal power was said to be essential to insure the reclamation of arid lands—not lands of the United States alone, but arid lands generally. This was claimed as an inherent power of sovereignty—a sort of national police power springing from the needs of the situation. The opinion, of course, concedes the power of the United States to control the dispo-

sition of its public domain. Its interest in the use of water upon its own lands or the advantageous reclamation, use, and disposition of its own lands, or its general proprietary interest in nonnavigable waters was not in issue.

(6) Upholding of State ownership would disintegrate the law and destroy Federal interests without working any practical good to the States.

The western States can show no grant of innavigable waters to them, so they can not be held to own or control such waters without putting the whole law in that field on a new foundation.

As we have already shown, there is no basis in the common law for the proposition that the sovereign owns innavigable waters or the usufructuary right to them because of the nature of water or otherwise; also, local conditions can not work a transfer of ownership from the United States to certain of the States without a distinction being made, which the law has never made, between the right to the use of water and between other things which are the subjects of ownership, or without giving to the arid States a power and field of jurisdiction that is denied to other States—without, in fact, working that very inequality between the States in order to avoid which rights in navigable waters were held by this court to be vested in these same new States.

Water law in the dual-system States is incapable of explanation or of being put upon any logical

basis if common-law principles and their sure result, Federal ownership, are to be abandoned in favor of any principles that can support ownership or power in the States. Furthermore, as we have seen, the appropriation system in Colorado and the States that follow her lead rests as a matter of history and with logical completeness upon the same principles that that system rests upon in California, where it originated.

It certainly is an astonishing proposition that the owner of most of the land in which these waters are or over which they flow lost title to the right to use them at some period, near or remote, upon the mere admission of the States. The common law considered these estates in land and water as one. They could be separated, as we have seen; but normally and originally they belonged together. These particular lands were practically useless without the water, and certainly the water was useless without the land. Furthermore, access to the water could not be obtained without the landowner's permission. To say that under these circumstances the owner of all the land had no interest in the water, or that it would be desirable that one sovereign should own the land as a proprietor and that another sovereign should own the use of the water as a royalty or otherwise would be a *reductio ad absurdum*.

Besides these objections based upon the law, there is this very important practical objection to

State ownership of innavigable water—that while working no practical good to the States, because the liberality of Congress has fully taken care of appropriations within them according to their own laws, it would put the Federal Government, as the proprietor of vast areas of land, at the mercy of the States, and so would disastrously affect its great reclamation, Indian, and other Government policies.

81115—22——5

The controversy, as one involving an interstate stream, should be decided upon the basis of the Federal ownership of lands and waters, thereby confining the ownership of the States, as ultimate proprietors, to such water rights as have been or may be granted to the respective States for themselves or for use in connection with the lands within their borders.

(1) In practice the Federal Government disregards State lines in the use and control of waters for its own purposes, and State lines have been equally disregarded in the grant and acquisition and use of private water rights in the Western States, so a division of water between the States making State lines controlling would interfere with the Federal use of water and seriously modify or destroy existing vested rights. These rights being grants from the paramount Federal sovereignty should be upheld as against the claim that the States which enjoy a quasi sovereignty only should be treated in this respect as independent nations and the waters be divided between them on that basis and in disregard of the rights of the Federal Government and of the Federal grants.

Under our theory of the Federal Government's original proprietary right to the use of innavigable waters occuring in and flowing over its lands, and that all private rights to such waters have been derived by grant from the Federal Government,

we contend that there is no room at all for a division of the waters of interstate streams between States so long as such waters are Federal property or even if they have been granted, except in strict recognition of such grants.

Many of the Government's reclamation projects, in fact, by far the greater number, we understand, depend largely, if not wholly, upon the waters of interstate streams. These projects have been undertaken and the settlers under them have gone ahead upon the assumption that the water rights of the projects would not be subject to readjustment because of the existence of any overlying paramount power that could be invoked by the States. Similarly private water rights, whether acquired as riparian rights or by appropriation, have been acquired and, as we contend, granted by the Federal Government in the same way. Many of the most valuable of these grants were made while the States were Territories, and some of them doubtless before the Territories even took the boundaries that were finally adopted when they became States.

We have here on the one hand the Federal Government, the paramount sovereign, owning and granting property rights of the highest dignity and value in a subject-matter, that necessarily reaches over and disregards State lines. The grant of a right, whether riparian or appropriation in character, in the lower State, immediately below the upper State's line, to be of any real value must carry with it a right in the flow of the stream that

reaches up into and limits uses in the higher State. The rights so granted are protected by the Constitution of the United States and, by Federal law, are specifically required to be excepted from all patents made thereafter by the Government itself. (16 Stat. 217, sec. 17.) Opposing this situation, we have, on the other hand, the idea that because the States in which these grants are made enjoy many attributes of sovereignty, these Federal grants should be limited. The contention of the States is that the Federal Government can not decide, even though all of the lands and the use of the water are its property, and even though it is itself a sovereign, the extent of the rights it grants in this property, which necessarily must transcend State lines, but that their extent is subject to be determined by a future adjudication between the States alone. Their contention is, further, that that adjudication should be made upon the theory that the States are in this regard independent nations.

We are, of course, familiar with the concept that the sovereign of a political State has a title and right of ownership to all of the property within that State which is behind and superior to the rights of its citizens, and that necessarily that full sovereign, in a controversy with another sovereign, may speak the last word with regard to all of the property in the State. It follows from this, of course, that the citizen's title in such case stands or falls with that of his sovereign. If his sovereign has to give up property

rights to the other sovereign, the citizen, of course, must suffer.

This principle we contend should not apply with regard to our Commonwealths. They are the ultimate owners of all within their borders only in a limited sense. Another and superior sovereignty, the United States, sees to it, through constitutional provisions of its own, that property and personal rights of the citizens of those Commonwealths, who are also its own citizens, are duly protected. It seems to us that under these circumstances these rights of individuals must be considered in any controversy between our States, and that the rights granted by the Federal Government to its citizens and the citizens of the Commonwealths should stand as against any theory of what a proper division would be if they did not exist. Our Commonwealths are not sufficiently sovereign to require any such readjustments as would be required if they were fully sovereign, or to demand any such overriding of the power of Congress to make final disposition of the Federal property.

State equality would not be impaired by a solution upholding these Federal grants. What is required by the principle of States equality is an equality of powers, not an equality of subjects upon which to exercise them. The Federal Government may exhaust its mines or forests within a State or otherwise dispose of its property there as it will, regardless of whether or not such disposition limits the field within which that particular State might otherwise exercise powers which it undoubtedly enjoys

equally with all of the other States. To confine the States' jurisdiction, as we contend it should be confined, to rights in nonnavigable waters which have been granted by the Federal Government directly to those States or for use on lands within their borders would, under these principles, in no way limit the jurisdiction of the States anywhere within their boundaries over all the proper subjects of State power and control.

(2) **The contentions of the States are not in accord with fundamental ideas of either State sovereignty or water law and are impracticable.**

Both of the States in this suit disregard the peculiar situation created by the fact that under our system titles to property often do not spring from the organs of municipal sovereignty, the States. They disregard the further fact already referred to by us that our States are not truly sovereign and that property rights in them are protected by another and higher sovereignty, the United States. It is for these reasons that the attempt in this suit to ignore the Federal title to the innavigable waters which have not yet been granted and the effect of Federal origin and Federal protection of property rights upon such of them as have been granted, leads to false reasoning and wrong conclusions.

Taking the attitude just referred to, both States are seeking a solution based upon the idea that the States are full sovereigns and that they face each other with regard to this stream just as they would if they were not Commonwealths of our Union but were independent members of the family of nations.

Colorado's first contention, that she may use the waters within her boundaries wholly regardless of the effect upon the flow of the stream in the lower State, would be untenable even if the two States were in truth, full sovereigns. If they were such sovereigns, a use of that character would be so repugnant to natural ideas of justice as to warrant the lower State to resort to war to put a stop to it. (See *Missouri* v. *Illinois*, 200 U. S. 496.) The proper division of the waters or the benefits of the stream is a justiciable matter to be determined by this court and was so held in *Kansas* v. *Colorado*, 206 U. S. 46.

The second contention of Colorado we regard as also untenable. It is that a division of the waters of the stream should be made between the two States upon some theory of an equitable enjoyment by each State of the benefits of the common resource. This doubtless would be the correct general principle to go on, however difficult of application it might be, if the States really were, and so were to be treated, as independent nations. State sovereignty is not, as we have said, of that high character, however, and that fact and the existence of the Federal origin and Federal protection of titles to water rights preclude such a solution absolutely and as a matter of law. The consideration just stated, we contend, settles the matter. However, we wish to point out that even if that were not the case it would be a very difficult thing to do and would be opposed to our fundamental ideas of water law to make an apportionment of this or any other interstate stream upon such

a basis as Colorado suggests. On the one hand, it is hard to see how existing private rights could be adequately protected unless the division between the States were made, as we contend it should be, exclusively upon the basis of the Federal origin of such rights. And on the other hand it is equally hard to see upon what theory of water law the general principles of the riparian doctrine could be disregarded if the two States were to be taken as in truth facing each other as full sovereigns and, therefore, as true, ultimate landowners of all riparian lands and of other things capable of ownership within their boundaries.

It is to be noted that Colorado in her briefs carefully refrains from saying just how the division should be made under her own theory or upon what principles except the very vague one of general fairness. She seems to contend strenuously for a proprietary ownership in herself of innavigable waters within her borders and for the upholding of the appropriation system there; but as against her sister States, into whose lands the waters falling on her mountains ultimately flow, she desires to have full riparian rights, so that she can develop her own lands in the future, slow or fast as she pleases, and retain a large ownership in the water in any event.

To our minds the upholding of such a doctrine would go far to lock up the resources of the West; and here we think the existence of the Federal title and the fact that the States are not full, independent sovereignties offer both a logical and a practical solution.

Wyoming contends that a division should be made between the States in accordance with the priority of appropriations made by their respective citizens, but with the modification that the use of the water should be confined to the lands within the watershed.

We are clear that making the watershed a controlling factor would be unwise. Often indeed it is essential for the proper development of the State that it be possible to take water far beyond any such confines. This is often necessary for city water supplies, to name only one of many important uses, and we see no reason why any such limitation should be placed upon the use by a State of any part of a stream that might be awarded to it.

Wyoming's argument for a division on the basis of prior appropriation disregarding the State line would not be in accord with our fundamental ideas of water law if we were to ignore the Federal title and its effect and were to adhere to the theory that the States in this regard are to be treated as full independent sovereignties. As such sovereignties how could their situation as riparian owners be ignored and they be confined in their rights in the stream to water that they had already appropriated, and, as to the surplus waters, be given merely a right to engage in a race to make further appropriations?

The fact that their laws recognize priority of appropriation as governing the rights of their citizens can have no bearing. These laws in neither instance were made to govern the State itself as

In the Supreme Court of the United States

OCTOBER TERM, 1916

Number 7 — Original

THE STATE OF WYOMING, Complainant,

vs.

THE STATE OF COLORADO, The Greeley-Poudre Irrigation District, and The Laramie-Poudre Reservoirs and Irrigation Company, Defendants

IN EQUITY

Supplemental Brief on Behalf of the Plaintiff

Statement of the Case

This is a suit by the State of Wyoming against the State of Colorado and two individual defendants incorporated under the laws of that State, seeking to prevent the diversion of certain waters from the Laramie River. This river has its source in Colorado and flows into Wyoming.

The contention of the plaintiff is that she owns lands in the valley of the Laramie River watered by that stream, and also that she and her citizens since

1865 and prior to any right to any of the waters of the stream in the defendants, or either of them, appropriated and used in the irrigation of large amounts of land and in the development and maintenance of large communities the waters in controversy; and that the defendants, without right as against the rights of the plaintiff and her citizens, is threatening to take a large amount of the waters of the stream so as to deprive the plaintiff and her citizens of the use thereof, to the great and irreparable injury and damage of the plaintiff and her citizens.

The contention of Colorado is three-fold:

A. That there is an abundance of unappropriated water in the stream, and that she will take only from the surplus.

B. That the State of Colorado is entitled to an equitable division of the water, and that the amount she intends to take is not more than her equitable share.

C. That the waters at the place where they are to be taken are found within the boundaries of Colorado, and that she as a sovereign is entitled to take any waters found within her borders without regard to any rights of any other State or person.

The facts contended for in the first proposition are disputed by the plaintiff; likewise the facts and the principle of law as contended for in the second, and the principle of law contended for in the third.

The case has already been argued before this Court, and we will content ourselves with this brief statement of the controversy here, and will elaborate the facts more at length in the discussion of the evi-

dence in that portion of the brief devoted to the argument.

Throughout this brief all references to pages upon which evidence appears are to the marginal page numbers.

Brief of the Argument

FIRST
Discussion of the Evidence

SYNOPSIS

I. Amount of Water to be Taken by Colorado. p. 6.

II. Area of Land Reclaimed in Wyoming. p. 11.

a. Under Ditches of Conceded Priority. p. 11.

1. Ditches from Main River. p. 13.
2. Ditches from Tributaries. p. 18.

b. Unirrigated Acreage under Old Ditches. p. 21.

Abstract of Wyoming Decree Adjudicating Rights on Laramie River. p. 24.

c. The Contested Priorities. p. 30.

1. Bordeaux and Sybille Units of Wyo. Dev. Co. p. 36.
2. Lake Hattie System. p. 37.
3. King Ditch and Hutton Lakes Reservoir. p. 39.
4. James Lake System. p. 40.
5. Sodergreen High Line. p. 40.
6. Colorado Tunnel Project. p. 42.

7. Colorado Detour Canal. p. 61.

8. Colorado Poudre Valley System. p. 65.

9. Wyoming's Claim to Benefit of Typical Development. p. 73.

III. Wyoming Experiences Shortage in Water Supply which any Colorado Diversion will Increase. p. 76.

IV. Consideration of Seasonal Distribution of Flow of River Proves Certainty of Injury. p. 82.

Comparative Table of Discharge at Glendevey and Woods Landing. p. 85.

V. Colorado's Defense Depends upon her Right to Compel Prior Appropriators to Construct Reservoirs. p. 89.

VI. Reservoirs Will Not Solve Wyoming Problem. p. 90.

Table Showing Annual Fluctuation in Flow of Poudre. p. 95.

Adequacy of Water Supply if Fully Conserved. p. 100.

a. Average Annual Discharge of Laramie River. p. 101.

b. Area of Land Irrigated. p. 115.

c. Duty of Water. p. 116.

VII. Conclusions to be Drawn from Issuance of Late Permits in Wyoming. p. 121.

I. AMOUNT OF WATER TO BE TAKEN BY COLORADO

By the bill of complaint it is charged that the defendants intend to divert 100,000 acre feet of water

per annum from the Laramie River, and throughout the case the defendants have admitted that they intend to take all of the water they can divert (p. 2120), but this amount is claimed to be less than 100,000 acre feet. On page 144 of Vol. I of the original brief for defendants, it is said: "Colorado in this suit insists upon her claim to divert 91,000 acre feet of water of this interstate stream." It is probably true, however, that this amount is derived from the testimony of the State Engineer of Colorado, Mr. Field, who concluded from his examination of stream flow records (p. 3424) that the total average annual flow near the Colorado tunnel is 77,000 acre feet; that about 74 per cent. of this amount can be diverted into the tunnel, making an average annual diversion of 56,000 acre feet; that this is exclusive of the amount that can be secured through extending the West Side Collection Ditch to McIntyre Creek, an extension which is not only possible, but is a part of the "suggested plan". Mr. Field concluded that this extension would divert on an average 15,000 acre feet per annum, or 75 per cent. of the water in McIntyre Creek (p. 3425) making a total average diversion through the tunnel of 71,000 acre feet. In addition to this amount, Colorado, its witness says, is already diverting an average of 20,000 acre feet per year from the Laramie River into the Poudre, being 18,000 acre feet through the Skyline Ditch and 2,000 acre feet through the Divide or Wilson Supply Ditch (p. 3426). The Skyline Ditch was commenced in 1891 (p. 2205), and the Divide Ditch was constructed several years later, defendants' Exhibit 24 (p. 3398), in which this ditch is designated "Sand Creek Ditch", showing that water was carried through it in 1902. This makes the total of 91,000 acre feet.

It must be borne in mind, however, that these amounts are estimated for years in which there is an average runoff, and as stated by Mr. Field (p. 3401), the amount diverted yearly will be more constant than the flow of the stream, there being a higher percentage diverted in years of small flow than in years of large flow, on account of the pressure for water. This is well illustrated by the diversion through the Skyline Ditch, as shown on defendants' Exhibit 124 (p. 3398), from which we take the following table:

Table Showing Discharge in Acre Feet of the Poudre River, Skyline Ditch and Divide Ditch, April to October, and Percentage of Poudre Discharge as Compared to Thirty-Year Average

Year	Net Poudre Discharge	Percentage of Average	Skyline Ditch Discharge	Divide Ditch Discharge
1899	388,591	131	17,699	.....
1900	474,573	160	18,657	.....
1901	339,155	114	23,805	.....
1902	151,636	51	22,124	1,925
1903	345,150	116	26,114	1,713
1904	315,437	106	23,434	6,810
1905	361,652	122	13,291	0
1906	279,974	94	16,693	5,004
1907	386,224	130	15,024	5,400
1908	252,843	85	17,958	2,092
1909	486,002	163	12,725	0
1910	157,514	53	16,435	783
1911	205,611	69	19,085	4,418
1912	297,722	100	20,986	2,157
1913	217,959	73	14,639	0

It is shown here that in 1901, when the flow of the Poudre River reached 114 per cent. of its average, the amount diverted through the Skyline was 23,805

acre feet, and in the following year when the flow of the Poudre was only 51 per cent., the amount diverted through the Skyline was 22,124 acre feet. In 1907 the Poudre flow was 130 per cent., and the Skyline diversion only 15,024 acre feet. In the following year the Poudre flow was 85 per cent., and the Skyline diversion rose to 17,958 acre feet. In 1909, when the Poudre flow was 163 per cent., the Skyline diversion was 12,725 acre feet, and in the following year when the flow of the Poudre was only 53 per cent., the Skyline took 16,435 acre feet; and in 1911, another year of small flow, equaling only 69 per cent. of the average, there was diverted through the Skyline 19,085 acre feet, within 1,000 acre feet of the amount taken in 1912, which had a flow almost fifty per cent. greater. The diversion through the Skyline canal is estimated by Mr. Field (p. 3422) as being 75½ per cent. of the total amount of water susceptible of diversion through that ditch. In a general way the Divide Ditch, which on Exhibit 124 is designated as the Sand Creek Ditch, exemplifies the same practice, although this is a smaller ditch and the water it furnishes to the Poudre Valley is of less importance to the system with which it is connected than is the water carried through the Skyline Ditch, and it appears that there were three years in which no water at all was diverted through this ditch. The amounts diverted, however, run as high as 6,810 acre feet in 1904, which was a year said to be but little above the average in stream flow, and was 4,418 acre feet in 1911, a year of only 69 per cent. of the average flow. This exhibit demonstrates two things, first, that Mr. Field's estimate of 18,000 acre feet for the Skyline and 2,000 acre feet for the Divide as being the average annual diversion, is very much too

low, and second, that if the year 1912 was "normal" both on the Poudre and on the Laramie, as contended by him, and the Skyline Ditch diverted 20,986 acre feet in 1912 and 19,085 acre feet in 1911, which was very much below an average year, then the amount diverted through these mountain ditches in years of small flow must be practically 100 per cent. of the amount of water available for diversion, a conclusion in exact accord with Mr. Field's statement (p. 3401) to which reference has already been made, that in years of scarcity of water the percentage diverted from the foreign watershed would be proportionately greater than in years of plenty.

Our conclusion with respect to the amount of water that Colorado will divert from the Laramie River into the watershed of the Poudre, is:

1. That under conditions existing prior to 1913, the amount would in average years exceed 91,000 acre feet, as contended by Colorado, by at least 4,000 acre feet, the estimate for both the Skyline and the Divide ditches being 2,000 acre feet too low, as shown by their records set forth in defendants' Exhibit No. 124.

2. That the constantly increasing pressure for water in the Poudre Valley will certainly cause added efforts to divert water from the Laramie both earlier and later in the season, and with less loss, as by concreting portions where leakage is excessive, as is to be done in the Poudre Valley (p. 1869), so that even in average years the amount diverted will be much more than 75 per cent. of the amount available, and will increase the amount in average years from 95,000 acre feet to a much larger amount, the extent of the

increase being, of course, wholly problematical, but the fact of the increase certain.

3. That in years of low flow and of greatest need of lower Wyoming appropriators, the proportion of the amount diverted by Colorado will rise to practically 100 per cent. of the flow of the stream at the diversion works.

II. AREA OF LAND RECLAIMED IN WYOMING

We divide this discussion under several heads:

(a) Area of Wyoming land already irrigated under ditches having a conceded priority over Colorado diversion.

(b) Area not yet actually irrigated, for which rights are claimed under ditches themselves of conceded priority.

(c) Area lying under ditches of disputed priority; with which is correlated a discussion of the evidence upon which Colorado bases its claim of priority of August, 1902, for the Greeley-Poudre system.

(a) The evidence offered by Wyoming upon this point consists almost wholly of the testimony of a great many witnesses, each of whom testified as to the amount of land irrigated from a ditch owned by him or with which he was quite familiar. We conceive that these witnesses are better able to testify with certainty than could third persons or engineers not

personally familiar with the use of the water, and who in making plane table surveys necessarily depended upon the conclusion of a rodman as to the limits of the irrigated area, because a very large part of the acreage, particularly upon the Laramie Plains, was utilized as pasture and hay was not cut therefrom, and it is obviously difficult for an outsider to ascertain definitely the limits of the land upon which water is applied in this manner. Not only does the conflict between the witnesses for Wyoming and the engineers who made a survey for Colorado illustrate this fact, but the same thing is shown in the testimony with respect to the area of the land irrigated in the Laramie Valley in Colorado. J. A. Whiting, a civil engineer employed by Wyoming, surveyed the Colorado ditches in 1910, there being six in his party, and ten days being devoted to the work (p. 1266). The total acreage of all land lying between the ditches and the river was found to be 1856.64 acres, of which 567.6 acres consisted of land largely covered by willows (p. 1270.) The engineer for the Greeley-Poudre Irrigation District, which had purchased many of these Laramie Valley ranches, (p. 3460), John R. Wortham, who was familiar with the ditches and the irrigation therefrom, made a survey also, and testified that the total acreage was 4250 acres (p. 3457). Both Mr. Wortham and Mr. Whiting are competent, honest engineers, and we have no reason to doubt the good faith of either, but the one was not familiar with the ditches and the use of water therefrom; the other was. For the same reason the evidence of the Wyoming witnesses with respect to irrigation in Wyoming shows a much larger acreage than does the testimony of the Colorado engineers, although the disparity is not nearly so great as in the

case of the Colorado land. We have summarized the testimony of the Wyoming witnesses as follows:

1. Ditches from Main River

Riverside Ditch No. 1 and the King Ditch had been constructed prior to 1880; Riverside Ditch No. 2 was constructed in 1884 by enlarging the Gramm Ditch, constructed in 1882 or 1883; the Caldwell & Gardinier Ditch was built prior to 1886, and from that time the four ditches irrigated upon the Riverside and King ranches about 13,500 acres. (pp. 278-9, 324-5.)

Murphy Ditch, built in 1877 or 1878, irrigates about 80 acres, (pp. 409-10).

Last Chance and Fisher Ditches, built in 1884, and the O. Sodergreen Ditch, built in 1878 and enlarged in 1884, irrigate 800 acres, (pp. 410-11).

Mansfield's O. N. Ditch constructed in 1884 or 1885 irrigates about 640 acres, (p. 411).

Hammond North and South Ditches, built in 1885 or 1886, irrigate 160 acres, (p. 412).

Smith No. 1 and No. 2 Ditches, built in the '80s, irrigate 80 acres, (p. 412).

Lund's North Line Ditch, built in the '80s, irrigates about 320 acres, (p. 412).

Burg's Ditch, constructed in the '80s, irrigates more than 200 acres, (p. 413).

Central Ditch irrigates 50 acres, (p. 413).

Sodergreen No. 1 and No. 2 Ditches were constructed in the '80s and irrigate between 300 and 400 acres, (p. 414).

O. G. Ditch was built about 1887 and irrigates 640 acres, (p. 414).

Sodergreen South Ditch was built in 1887 and irrigates between 40 acres and 50 acres, (p. 415).

Island Ditch built before 1880 and irrigates 80 acres, (p. 416).

Heidrick Ditch constructed in the '80s and irrigates 160 acres, (p. 416).

Parker Ditch constructed about 1896 and irrigates 1650 acres, (pp. 416, 417).

Popp and Pahlow extended the Last Chance Ditch in the early '90s and irrigated therefrom 1,120 acres, (pp. 417-8.)

Sodergreen High Line Ditch was surveyed in 1907 and completed about 1910 and irrigates from 4,000 to 5,000 acres, (pp. 418-9); as the priority of this ditch is not conceded, being subsequent to 1902, this acreage is omitted from the recapitulation at the end of this review of the evidence.

Bush & Holliday Ditch was built several years prior to 1898, and irrigates 890 or 900 acres, (pp. 499-501); this land was irrigated prior to 1888, (p. 528).

Sutherland irrigated 50 or 60 acres by means of an overflow dam constructed in 1890, (p. 529).

The Bilderback Ditch was constructed prior to 1878, (p. 531), and was developed into the Dowlin Ditch, irrigating on the Heart Ranch 3,100 or 3,200 acres, (pp. 531, 534, 555).

Walcott Ditch constructed on Heart Ranch, across river from Dowlin Ditch, prior to 1888, and irrigated additional 550 or 600 acres, (pp. 535-6).

A number of small ditches constructed below Laramie City in the '70s and '80s, near ranch of witness Fitch, irrigated in Township 16, Range 73, 500 acres;

in Township 17, Range 73, 75 acres; and in Township 17, Range 74, 3,000 acres, (pp. 569-573).

Oasis Ditch was constructed in 1884, (p. 589); in 1910 an engineer determined by survey that the area lying under ditch with recognized water right was 11,246 acres, (p. 608); he did not survey actually irrigated acreage, but estimated that it was probably 75 per cent. of the total, (p. 618); while a witness who had charge of lands under the ditch in 1900 or 1901 testified whole area was irrigated excepting high spots averaging about 50 acres to the section, (p. 957).

Cooper Lake Ditch irrigates 750 acres, (p. 619-620).

LeRoy Grant Ditch irrigates 887 acres, (p. 730); the ditch was originally known as the Hutton Pick-up Ditch and was built in the '80s, (p. 718).

Fischer Ditch was constructed in 1887, (p. 750), and reconstructed in 1888, (p. 750); the surveyor who surveyed it in 1906 or 1907 testified it irrigates about 3,000 acres, (pp. 731-2).

The Pioneer Canal Company was organized in 1878, and the canal first constructed in 1878 and 1879, and enlarged in 1885, (p. 916). The company owning the works acts only as a carrier, the lands being owned by persons buying annual water rights, (p. 884). In 1913, the year the testimony was taken, the plaintiff's engineer made a reconnaissance of the area under the canal and ascertained that the acreage irrigated in that year was 11,486 acres, (p. 824), this being corrected later to 11,556 acres, (p. 844), and he testified that his examination showed that in former years a greater acreage had been irrigated, (p. 825), being at least 2,000 acres more, (p. 828). The superintendent of the canal, Titus, testified that ten or twelve years

before 1913 he had made a map of the irrigated area, which was then 17,000 or 18,000 acres, and that this amount of land was irrigated each year up until 1912, when between 19,000 and 20,000 acres was irrigated, this being the largest amount ever irrigated under the canal, (pp. 863-4), which covers an irrigable acreage of between 35,000 and 50,000 acres, (p. 865).

Biddick Ditch was built in 1897 and irrigates 578 acres, (p. 903-4).

All of the above ditches divert water from the principal stream above its junction with the Little Laramie River; the following divert water from the Laramie River below the mouth of the Little Laramie River:

Boughton Ditch, constructed in 1884, irrigates more than 7,000 acres, (pp. 748-9).

The Gillespie-Dunn and Dunn Ditches were built in 1887 or 1888; the Ione Lake Ditch in 1890; they irrigate respectively 140 acres, 190 acres and 620 acres, (pp. 704-5).

The Wyoming Development Company's system, supplying water to the Wheatland colony, was commenced in 1883 and prior to 1885 there had been expended on Canal No. 1 alone the sum of $142,210.94, (p. 1291). The expenditures prior to 1902 were as follows: (pp. 1291-2):

Canal No. 1	$143,601.76
Canal No. 2	34,819.11
Canal No. 3	44,355.28
Reservoir No. 2	115,541.56
Tunnel	138,311.66
Diversion Dam	1,835.27
Laterals	4,178.42
General expenditures (not including advertising and commissions on sales)	156,075.17
Total	$638,718.23

In 1894, when settlers were first secured, 2,000 acres were irrigated, and in 1900 this had grown to 10,000 acres, (p. 70); in 1913, when the evidence was taken in this case, the area irrigated in the original project was 33544 acres, (p. 168). This does not include the area irrigated in the Bordeaux project, the priority of which is contested, being in that year 1,004 acres, (p. 168).

Dodge Ditch, built in 1894, irrigates 120 acres, the Dodge South Side Ditch, built in 1906, irrigates 93 acres, (p. 669); the latter is not included in the recapitulation, its priority being disputed.

Cramer Ditch, built about 1900, irrigates 220 acres, (p. 696-7)

McGill Ditch, completed in 1882, irrigates 705 acres, (p. 1294).

Cross T. Ditch No. 2, completed in 1884, irrigates 468 acres, (p. 120).

Scissors Ditch was constructed before 1880 and irrigates more than 250 acres, (p. 120).

Laramie River Ditch No. 1 was in use in 1881, and irrigates 800 acres, (p. 121).

Cross T. Ditch No. 1 was built in 1884 or 1885 and irrigates 90 to 100 acres, (p. 122).

The A. N. Spencer Ditches were built about 1890 and irrigate between 700 and 800 acres, (p. 123, p. 144).

Phillips Ditch, built 1890, irrigates 30 or 40 acres, (p. 125).

Uva Ditch, built in 1890, irrigates 200 acres, (p. 125).

Yates Ditch, built prior to 1900, irrigates 100 acres, (p. 132).

McCormick and Bright Ditch, built in '90s, irrigates between 300 and 400 acres, (p. 135).

The witness Whitney testified that a number of other small ditches were constructed along the lower portion of the Laramie River in the '90s, including the Gallagher, Reitz, Thompson, Ryan and Combination ditches, (pp. 122, 123, 124, 136, 143), but the acreages irrigated are not shown.

2. Ditches from Tributaries

The area irrigated from Sand Creek and its tributaries under ditches constructed prior to 1902 (p. 902), is 5,898 acres, (pp. 898-9).

The engineer of the plaintiff determined the irrigated acreage upon the Little Laramie River and its tributaries below the mountains (the mountain ditches not being included) by a reconnaissance made in October, 1913, as follows: Little Laramie River, 45,899 acres; Seven Mile Creek, 1,527 acres; Four Mile Creek,

a tributary of Seven Mile Creek, 918 acres; total, 48,344, (pp. 982-3). The lands found to be irrigated are listed in the schedule commencing p. 995. He found lands which had been irrigated in previous years, but not in 1913. (p. 984.) A subsequent witness testified that there had been but little change in irrigated acreage in 20 years, and only two small ditches, with total of 240 acres under them, constructed since 1903.

No other evidence was offered by Wyoming with respect to the irrigation from the tributaries of the Laramie. By Exhibits H, N, and O, adjudicating these streams, hereinafter referred to in detail, the large number of small appropriations from these tributaries is shown, but we consider proof of exact area irrigated upon those tributaries unimportant in this case, for certainly Colorado cannot force us to abandon to that State the stream from which our major appropriations are made merely because in some other source we might conceivably find water to irrigate the lands we have reclaimed by use of the water of the Laramie; another reason for omitting reference to these other tributaries is that with the exception of one or two very small creeks near Laramie City, these remaining tributaries lie below the Laramie Plains and the Wheatland No. 2 Reservoir and could not be used to supply any of the Wyoming appropriations particularly in question.

Total irrigated from Sand Creek ..... 5,898 acres

(b) In addition to the land already irrigated under prior rights in Wyoming, there is a very large acreage lying under the old ditches and intended to be irrigated therefrom, upon which water has not yet been applied. Colorado's State Engineer, Mr. Field, said (p. 3637), "As ascertained from the plane table survey, the amount of land actually irrigated was less than 50 per cent. of the amount lying under the old ditches." M. R. Johnston, formerly manager of

the Wheatland irrigation system, which is below the Laramie Plains area, testified (p. 69) that the Wheatland system was commenced in 1883, and the area to be reclaimed consists of about 60,000 acres, of which about one-half has been irrigated. This is a colonization project, and the extension of the use of the water depended upon the rapidity of the settlement, which in turn is of course wholly dependent upon economic principles and cannot be hastened by the efforts either of the State or of the management.

The plaintiff offered in evidence copies of three decrees adjudicating rights to the use of water of the Laramie River and its tributaries in Wyoming, not for the purpose of proving thereby that so much water had been appropriated, because the decrees could not have that effect against the State of Colorado or its citizens who were not parties to the proceedings, but for the purpose of confirming the competent evidence, which had been introduced with respect to practically all of the ditches covered by the decrees, and to show that the State of Wyoming had itself recognized the validity of these claims. The decrees likewise show the amount of land which Wyoming citizens have intended to reclaim under ditches of conceded priority, and the right to increase the area irrigated under these old priorities until the entire area for the reclamation of which the ditch was constructed has been reclaimed, is recognized by these decrees.

The three decrees are Exhibits H, O, and N, and have been printed and bound together and filed with the original exhibits, their length making it inadvisable to reproduce them in the printed record. Exhibit N is a decree of the district court of Laramie County, Wyoming, of December 27, 1912, and covers the

Laramie River and all of its tributaries excepting Soldier Creek, Little Laramie River, and Chugwater Creek, which had been adjudicated previously in separate proceedings. The proceedings in which the decree was entered were commenced before the Board of Control of Wyoming, a quasi-judicial body having by constitutional provision jurisdiction to adjudicate all water rights, with provision for an appeal to the district courts from its decrees. The proceedings were commenced before 1900, and accordingly all of the priorities are of a date earlier than 1900, with the exception of one which has a priority dated 1900; the decree itself provides (p. 47 of Exhibit N) that it shall not affect any ditch constructed under permit the date of completion of which did not expire prior to May 25, 1900.

Exhibit O is a decree of the Board of Control dated March 26, 1892, adjudicating the appropriations from Soldier Creek, a small tributary of the Laramie River near Laramie City. Exhibit H is a decree of the Board of Control dated May 5, 1892, adjudicating appropriations from the Little Laramie River, the one large tributary of the Laramie River upon the Laramie Plains, and entering the Laramie River about fifteen miles below Laramie City, and below the much larger part of the area irrigated upon the Laramie Plains.

We did not offer in evidence the decree of the Board of Control adjudicating Chugwater Creek, this creek being omitted from consideration because it enters the Laramie River but a few miles above its mouth, lies below the Wheatland district, has a large amount of land irrigated from it, and is not presented by any witness as a possible means of supply for any of the lands irrigated from the Laramie River, (pp. 4378-9).

In no better way can we show the gradual character of the development of the territory tributary to the Laramie River, the increase of the irrigated area and the great number of small appropriators upon whom individually and each for himself would fall the burden of constructing expensive reservoirs if Colorado should divert water from this river, than by tabulating the appropriations as adjudicated by the Laramie River decree. Although the decree does not so divide them, we have separated the ditches into groups, the first those lying above the mouth of the Little Laramie River, and the second those lying below the junction of the Laramie and Little Laramie Rivers.

Abstract of Exhibit N, Laramie River Adjudication

1. Ditches Above Junction with Little Laramie River

Date of Priority	Name of Ditch	Acres
1868	Dowlin	3,428
1877	Abbott	1,245
1877	Murphy	80
1879	Pioneer	49,030
1881	King	3,233
1881	Abbott & Coleman	415
1883	Riverside No. 1	1,501
1883	J. B.	120
1883	Caldwell & Gardinier	1,553
	Carried forward	60,605

	Brought forward	60,605

1899	Van Ortwick	50
	Total below Little Laramie River	73,521

3. Ditches from Minor Tributaries of Laramie River

Name of Creek	Acres
Five Mile Creek	3,073
Willow Creek	1,760
Willow Creek Tributaries	250
Sand Creek	4,871
Sand Creek Tributaries	415
Fox Creek	377
Harney Creek	965
Harney Creek tributaries	270
Shell Creek and tributaries	790
North Laramie River	2,324
North Laramie River tributaries	1,288
Slate Creek and tributaries	193
McFarlane Creek and tributaries	183
Sybille Creek	3,654
Sybille Creek tributaries	2,439
Other small streams	1,018
Total	23,870

The appropriations with priority before 1892 from Soldier Creek as adjudicated by the decree Exhibit O, total 1180 acres.

The appropriations earlier than 1892 in priority from the Little Laramie River, as adjudicated by the decree Exhibit H, number 130 and have a total of 48,356 acres. Of this great number of appropriations, one is for 4,120 acres, one for 3,200 acres, and no others for more than 2,000 acres.

Summary of Adjudicated Rights

From Laramie River prior to 1900	156,405	acres
From minor tributaries of Laramie River prior to 1900	23,870	acres
From Little Laramie River prior to 1892	48,356	acres
From Soldier Creek prior to 1892	1,180	acres
Total adjudicated rights exclusive of Chugwater Creek	229,811	acres
Deduct duplications where same land appears under two ditches (p. 3353)	6,339	acres
Net area	223,472	acres

The process of reclamation of arid land is shown by history, but we find in the record abundant testimony about the practice in Colorado, which differs in no way from that in any other irrigated country. The Colorado expert, Professor Carpenter, describes this universal irrigation practice as applied in the Poudre Valley as follows (p. 2314-15):

> "Water flowing in Cache la Poudre River as it passes out of mountains and begins to enter canals now serves much larger area than formerly. In 1870 it served ten thousand acres; in 1880 probably not more than three or four times that quantity; in 1890, about 130,000 acres. It now serves 260,000 acres. The same stream flow serves the latter acreage that served the first acreage given. The water stored in reservoirs is merely part of the stream flow, so that the peak part of the flow has since decreased, is stored in reservoirs as has also the waste at other times. The acreage served has been very much increased. For all purposes it is substantially the same water now as it was twenty or thirty years ago, with these changes in methods of use, matters of econ-

omy and conserving water. The struggle over water and pinching caused by shortage is much less than it was twenty-five years ago. * * In case of each of these ditches the land, especially near headgate, became more or less saturated. The ground water came near enough to surface so that it needed very little irrigation, and perhaps needed drainage instead of irrigation. That land, if not abandoned, was in situation where it would not need irrigation. They then transferred right to use that water to other lands lower down, and so ditch did not run any more water but it brought under cultivation more lands towards lower end of ditch. Did not increase its demand on stream in making extended reclamation. This extension was by means of extension of drain ditch or by formation of lateral companies, and laterals which might run out 5, 8, or 10 miles and were in effect an extension of main ditch. By this means this land has been brought under cultivation, and has had the effect of largely increasing the total acreage. These were mutual ditches, so that owners living near head who owned ditch stock have nearly all divested themselves of that stock."

And in this process, which is so largely dependent upon the raising of the water plane, the users of the Poudre Valley have stored in the subsoil in the course of thirty years, approximately 3,000,000 acre feet of water (p. 2312). Wyoming, by the adjudication decrees above discussed, has recognized the general principle of irrigation practice and has protected its citizens in their right to divert water for the irrigation of the area under ditch and to extend the use over this land as the one parcel becomes saturated and requires less water. Exactly the same practice is recognized in Colorado under a somewhat different form, for there

an appropriator is given the right to take all of the water he has sought to appropriate, irrespective of the area to be irrigated, and as he finds it possible to irrigate this area with a small amount of water he can sell a portion of the water to another, and it is contended that this very practice is largely responsible for the extensive development of the Poudre Valley (p. 2316).

C. THE CONTESTED PRIORITIES

As we understand the order directing re-argument, the Court desires a presentation of the facts upon the increase, if any, in the extent of the use of water in Colorado and Wyoming between the time when the Tunnel Project was commenced and the time when this suit was commenced.

Elsewhere in this brief we have undertaken to show by references to the evidence that the combined use of water in both States, at least as early as 1901, and thenceforth, extended to the entire flow of the stream and its tributaries in each of the thirteen years —1901-1913 inclusive—except in 1909 and possibly a small amount released from the Wyoming Development Company's No. 2 Reservoir as a precautionary measure in 1907. No more definite data are available as the quantities were not measured during that period, except in the years 1912 and 1913. The data of the measurements in these two years are set forth in final form in plaintiff's Exhibits T-3, T-4, T-5, T-6, T-7 and T-8 inclusive (4283-4296).

Particulars as to the ditches and lands in connection with which water was used within the Valley in

Colorado are set forth in the Testimony of J. A. Whiting (1266-1275) and John R. Wortham (3454-3463), and in the Exhibits offered by these witnesses in connection with their testimony. These Exhibits were not printed in the Abstract but are found in connection with the transcript. It is not suggested that any of this irrigation began after 1900, and we understand that all of the irrigation in the Laramie Valley in Colorado passes unquestioned as being of old and established priorities. In addition to this irrigation, the diversions of the Skyline Ditch and the Divide or Wilson Supply Ditch out of the valley for irrigation elsewhere in Colorado, occurred prior to 1902. These diversions are elsewhere discussed and are not involved in this controversy.

Elsewhere in this brief we have brought together the data afforded by the evidence relating to the ditches taken out and the lands irrigated prior to 1900 or at latest 1902. As shown in that connection it so happens that the Decree of the District Court in Wyoming in the proceedings to determine priorities of right to the use of the water of the Big Laramie River and its tributaries (excepting the Little Laramie and Soldier Creek, which had been previously adjudicated), were based upon evidence taken in 1902 and prior thereto, so that the Decree had relation to the appropriations and use of water as they existed in and prior to that year.

A copy of this decree was put in evidence as Exhibit N (1042) and a copy of the Little Laramie Decree, made in 1892, was introduced as Exhibit H (1318). These Exhibits are not printed in the abstract but accompany the transcript and have been abstracted in this brief.

The plaintiff's proof in this case is not rested upon

these Decrees, which, of course, are not conclusive as against the defendants herein, who were not parties to the proceedings. The plaintiff has shown in substance the same facts by the independent original testimony of witnesses produced in this cause, reference to which testimony has heretofore been made.

The question of additional use is doubtless suggested by the construction which has taken place since the works above mentioned were put in use, and more specifically since the Tunnel Project of the defendants was commenced, and the period to which this discussion is directed extends from that date to May 29, 1911, when suit was brought. In the answer of the defendant State it is alleged (printed p. 30) that on August 25, 1902, the Laramie-Poudre Reservoir & Irrigation Company and its predecessors in title made an appropriation of 1235 second feet of water from the Laramie River, and that there was then abundant water in the river to satisfy all prior appropriations in Colorado and Wyoming. In the Joint Answer of the defendants, Laramie-Poudre Reservoir & Irrigation Company and Greeley-Poudre Irrigation District (printed pages 38-39), it is alleged that on August 25, 1902, the District and its predecessors in title "by commencement of the construction initiated its rights to the diversion for the purpose of irrigation and domestic use through the Tunnel mentioned in the Bill of Complaint to 1235 second feet of water" etc.

Further (printed page 44) it is alleged "that since such initiation, the defendants and their predecessors in title have diligently, by continuous work and expenditure on the construction of an extensive irrigation system, preserved the rights so initiated. Defendants aver that in perfecting the rights so initiated, the de-

fendants and their predecessors in title conceived an extensive irrigation system, consisting of collection ditches, tunnel reservoirs, and other reservoirs on the upper reaches of the Laramie River, a tunnel over 2½ miles in length, now entirely completed, and extending from the Laramie River through the mountain range, constituting the eastern boundary of the watershed of said stream", etc.

The defendants, therefore, by their pleadings and in the subsequent conduct of the case have selected August 25, 1902, as the significant date of commencement of their work. On the other hand, it is the understanding of the plaintiff (and we think shown by the evidence) that the Tunnel Project was not in fact commenced until very late in the year 1909, and a considerable time after the commencement of the principal works in Wyoming over which the defendants claim priority.

The period under discussion then may be considered in the view of the defendants to extend from August 25, 1902 to May 29, 1911, while in the view of the plaintiffs it extends only from about December 1, 1909 to May 29, 1911.

It is to be remembered that the evidence shows that the defendants' work is still incomplete. The time when it will be possible to divert and apply the water to the beneficial use intended cannot be certainly known until that is an accomplished fact. When this has been done the question will arise whether the defendants under the doctrine of "relation" can claim priority of appropriation prior to the time of application to beneficial use, and if so, for how remote a period back of that time. Under the rules universally laid down by the Courts dealing with rights of priority

by appropriation the right of the defendants must date from the time of applying the water to the beneficial use intended unless it is shown that by diligent prosecution of its work the defendants are in a position to claim rights by relation as of the date of the commencement of such work. This burden the defendants have undertaken to sustain from August 25, 1902.

2 Kinney on Irrigation, 1266-1299.
1 Wiel on Water Rights, 423-434.

Another fact which enters into the discussion of this question has relation to the character of the competitive works undertaken in Wyoming during the period to be discussed. These works (taking the period to extend from 1902 to 1911) include only the following works of any significance:

1. The Bordeaux and Sybille units of the Wyoming Development Company's system.
2. The Lake Hattie and Stewart Canal units of the Laramie Water Company.
3. The King Ditch and Hutton Lake unit of the Denver-Laramie Realty Company.
4. The James Lake unit of the James Lake Irrigation Company.
5. The Sodergreen High Line Ditch.

Other than these works it appears that the constructions in Wyoming since 1902 are insignificant. A review of the evidence shows only a few small ditches constructed during the period.

The Dodge South Side Ditch built in 1906 irrigates ninety-three acres (Marginal p. 669). The Dunn Ex-

tension Ditch, started in 1906-1908 and completed in 1910, irrigates 125 acres (pp. 705, 706).

Edward Hicks testified that he thinks only two small ditches have been taken out of the Little Laramie River since 1888, one by Chris Anderson, irrigating 160 acres, and one by Dwight Smith, irrigating about 80 acres (p. 1104).

John W. Ernest testified that the additional irrigation on the Little Laramie River (aside from the James Lake system) since 1898 would amount to about 1500 to 1600 acres (p. 1118).

E. D. Titus testified that he knew of no ditches of size or importance taking water from the Little Laramie constructed within the last fifteen years, except Lake Hattie and Lake James Ditches, and that there were not many small ditches (pp. 1138-1152).

M. C. Brown testified that the irrigation development on the Laramie Plains took place mostly between 1870 and 1900, and that the increase since 1900 has not been large (1181).

R. J. Cowper testified that all ditches of Soldier Creek were made between 1870 and 1889 (1203).

Asmus Franzen testified that all the land under the Boughton Ditch was irrigated as early as 1889 (p. 1207).

James Hardman enumerated the ditches on Sand Creek with the dates of construction showing that the latest ditch was constructed in 1901. (pp. 889-902).

Numerous other witnesses testified concerning particular ditches and a careful examination of their testimony does not disclose reference to any other ditches constructed since 1900, except the five larger works enumerated above.

These enumerated works with possibly one excep-

tion are simply extensions or additions to works which were in existence many years prior to 1902.

1. The Bordeaux and Sybille Units of the Wyoming Development Company's System

The Wyoming Development Company's system (see map attached to defendants' Answer) takes water from the Laramie River at a single point in Sec. 36, Tp. 23, R. 72, whence it is conveyed by tunnel into Blue Grass Creek, running down that creek and Sybille Creek, into which it flows, to a point in Sec. 13, Tp. 22, R. 70, whence it is taken out in Canal No. 1, extending in a general easterly direction. The Sybille unit of the Wyoming Development Company taps this flow in Blue Grass Creek in Sec. 21, Tp. 22, R. 70, and extends in a general northerly direction, irrigating lands between the ditch and Sybille Creek. The Bordeaux unit is an extension of Canal No. 1 from a point in Sec. 23, Tp. 23, R. 68 southeasterly to the vicinity of Chugwater Creek. Neither of these units makes any new diversion from the Laramie River or its tributaries. Both of them take water appropriated through the tunnel from the Laramie River, and by means of Reservoir No. 2, both of which were completed prior to 1902.

M. R. Johnston describes this system as constructed prior to 1888 (pp. 15, 25, 21-22), stating that only about 30,000 acres out of 60,000 acre tract originally contemplated had as yet been brought under irrigation (p. 69), and that in 1911 only about 450 acres were irrigated under the Bordeaux unit which was surveyed in February 1904 and on which construction began in

June, 1907, and was completed in June 1908, the surveys for the Sybille unit being commenced in August, 1907, and construction in 1910 (pp. 108, 109).

J. A. Elliott testified that the Bordeaux tract consisted of 10,000 acres, of which 1004 acres was irrigated in 1912, consuming 3060 acre feet, and that the Sybille Tract consisted of about 30,000 acres (pp. 168, 170).

2. The Lake Hattie System

The Lake Hattie construction consists of the Lake Hattie Inlet Ditch, taking water from the Big Laramie River, the Stewart Ditch, taking water immediately from the Little Laramie River, the Lake Hattie Reservoir, the Outlet Canal, and its branches, the North and South Canals. On the map attached to the Answer the locations of these several units are shown. Water is diverted from the Big Laramie River through the enlarged Pioneer Canal (dating from 1879), in Sec. 36, Tp. 14, R. 77, and carried for a distance of about three miles through the Pioneer and thence from a point in Sec. 21, Tp. 14, R. 76, the Lake Hattie Supply (Inlet) Canal conveys the water into the Lake Hattie Reservoir. The Outlet Canal and its branches extend from the eastern end of the Lake Hattie Reservoir in a general easterly direction as indicated on the map. The Stewart Canal takes water from the Little Laramie River in Sec. 1, Tp. 15, R. 77 and conveys it southerly to the Lake Hattie Reservoir.

In substance this diversion from the Big Laramie River was in contemplation as early as 1884, and was outlined by surveys substantially following the line of the constructed works and made in 1884, 1885, 1886,

1887, 1889, 1890, 1891, 1892, 1893, 1897, 1898, 1906 1907, 1908 as shown by the testimony of Charles Bel lamy (pp. 751, 769, 770), S. C. Downey (pp. 915-918 927-940), H. N. Roach (pp. 966-968, 970, 972-975) R. D. Stewart (pp. 977-978), previous to the final sur vey made by Z. E. Sevison in 1908-1909, (pp. 645-646) who found the stakes of the prior surveys (p. 650) so that if the taking of thought, the making of inter mittent surveys, the search for capital and capitalist (p. 947) and other activities incident to promotion may be considered such diligent prosecution of th work of construction as would entitle the promoter to the benefit of the doctrine of relation, the Lak Hattie enterprise might be considered to date from 1884.

In the view of the plaintiff, however, these histori particulars are only valuable to show the connectio between the works of the Lake Hattie system, as finally realized, and the original Pioneer Canal enterpris projected and constructed in 1879 and the followin years, and in substantial use for many years prior t the conception of the Greeley-Poudre Tunnel Project In another connection we discuss the position of thi and other later units of construction in connectio with old and established systems as the exercise of th right and custom so generally followed in the Poudr Valley as shown by the defendants' witnesses and s typical of irrigation development generally. For th present we are considering this new work only as origin ating in the beginning of construction in July, 1909 in competition for priority with the Tunnel Project o which construction was actually begun near the end c that year.

It is shown by the testimony of Mr. Sevison tha

actual construction on the Lake Hattie work was begun July 17, 1909, and prosecuted with great diligence and that the works were put in operation early in 1912 (pp. 646-649) or possibly in 1911 (p. 663); and by the testimony of Lyman E. Bishop that $944,000 had been expended prior to December 1, 1910, and a total of $1,418,000 up to the date of his testimony, water being first taken into the Reservoir early in July, 1911, (pp. 773, 779, 787). About 700 acres of new land was irrigated from this system in 1913 (p. 826).

3. The King Ditch and Hutton Lakes Reservoir

The King Ditch is an old ditch built and in operation since 1879 (p. 278). It was enlarged and extended in 1908-1911 to fill Hutton Lake as a reservoir.

Testimony of J. A. Winkler (pp. 278, 283, 283, 308, 309, 311).

As indicated on the defendants' map, water is taken out of the Laramie River, in Sec. 3, Tp. 13, R. 76, and conducted through the old ditch to the eastward for several miles, the extension not being shown on the defendants' map, but appearing in the plaintiff's map, Exhibit G. The water is conveyed to Hutton and Creighton Lakes in Tp. 14, R. 74, which have been converted into a reservoir. It does not appear that any considerable irrigation has taken place under this new construction, except in Sec. 4, Tp. 13, R. 75 (pp. 310-311). As indicated by the map, the acreage of land actually underlying this extension is comparatively small, and is largely irrigated already from other ditches so that this work will of necessity be used chiefly for the purpose of holding back the

flood waters for crops requiring later irrigation, and for exchange purposes.

4. The James Lake System

This system is essentially the enlargement and extension of the Bellamy Ditch taking water from the Little Laramie River in Sec. 2, Tp. 15, R. 77 and conveying it through the old ditch northerly and easterly to a point in Sec. 32, Tp. 17, R. 76, whence it is conveyed by the Lake James Supply Ditch into Seven Mile Creek and flows into the old bed of Lake James, previously without an outlet. The water is stored in this reservoir and diverted thence through an outlet ditch with two branches serving a body of land lying west of the Big Laramie below its junction with the Little Laramie. Z. E. Sevison made the survey for the works of this system, which was constructed 1908-1911, portions being completed and put in use in July, 1909, (pp. 631-644). Some 1500 acres had been irrigated under this system, of which 515 acres were in tillage in 1913 (pp. 991-992).

5. The Sodergreen High Line Ditch

This ditch does not appear on the defendants' map, or appears only as a short unnamed ditch, leaving the Laramie River on the north side in Sec. 36, Tp. 14, R. 77. It was surveyed in November, 1907, and construction work commenced on it in February or March following. It is about nine miles in length and serves a tract of several sections of land partly above and partly below the Lake Hattie Inlet Canal. The

ditch has been in use since 1911 (pp. 445-453). This ditch is really a revival of the Murphy-Collins Ditch, an old project begun many years ago, but the connection is not clear from the testimony and we suppose the Sodergreen Ditch will have to be considered as a new and independent construction. The ditch covers about 4000 acres.

A general view of the defendants' map thus discloses that these new constructions of 1900-1912 in Wyoming with the exception of the Sodergreen High Line Ditch, are designed and adapted to serve only lands which lay under the potential flow of the older works of unquestioned priority, and which could have been irrigated in every instance through distributing laterals from the older works. The reservoirs serve chiefly three purposes: First: To intercept and store at comparatively high levels water which could formerly be stored only at a lower level, where the radius of use was much shorter. Second: To carry over from the flood water period of May-June to the period of scarcity, July-August, the water formerly applied directly from the stream to the irrigation of native hay and pasture so as to make the same supply available for tilled crops of greater value requiring later seasonal irrigation. Third: To increase the re-use of water, which being applied on lands in the upper part of the valley, returns to some extent in the seepage flow for re-use lower down the stream. These are the familiar incidents of the typical irrigation development so elaborately described by the expert witnesses for the defendants.

6. The Colorado Tunnel Project

The defendants seem to question the right of the plaintiff and its citizens to this typical irrigation development—a right which the defendants have claimed and so freely exercised themselves for a long period of years, and to which they attribute in very large measure the progress and prosperity of the Poudre Valley; and they oppose this development in Wyoming with a claim of priority for the Greeley-Poudre Tunnel diversion project, which it is the object of this proceeding to prevent.

A sweeping claim is put forward to priority as of August 25, 1902, as a single system for the congeries of projects beginning with the Link Lake Ditch and Feeders filing of October 15, 1902, made by Wallace A. Link and Abraham I. Akin. Successive filings in May and October, 1904, September, 1906, July and September, 1908, and January, 1909, being Numbers 57, 1417, 1722, 3049, 4912, 5170, 5448 and 5453 in the office series of the State Engineer of Colorado, copies of which are among the Exhibits put in evidence by the plaintiff in this case, must be taken as, in the main, forming the basis of the defendants' claim to priority by "relation" from the date of the first survey of the first project in August, 1902, for the aggregate of the parts of the present plan to divert 70,000 acre feet or more per annum from the Laramie watershed to the Poudre watershed.

An analysis of the various projects as defined in the official filings thus made from time to time discloses the purposes of the defendants and their predecessors to divert from the Laramie watershed by three quite different and wholly independent routes and means:

1. The Link Lake Ditch and Feeders, subsequently designated as Upper Rawah Ditch, to collect water from a limited area on the western head waters of the Laramie and convey it to and through the Skyline Ditch over the Divide into Chambers Lake, an expansion of the Poudre River.

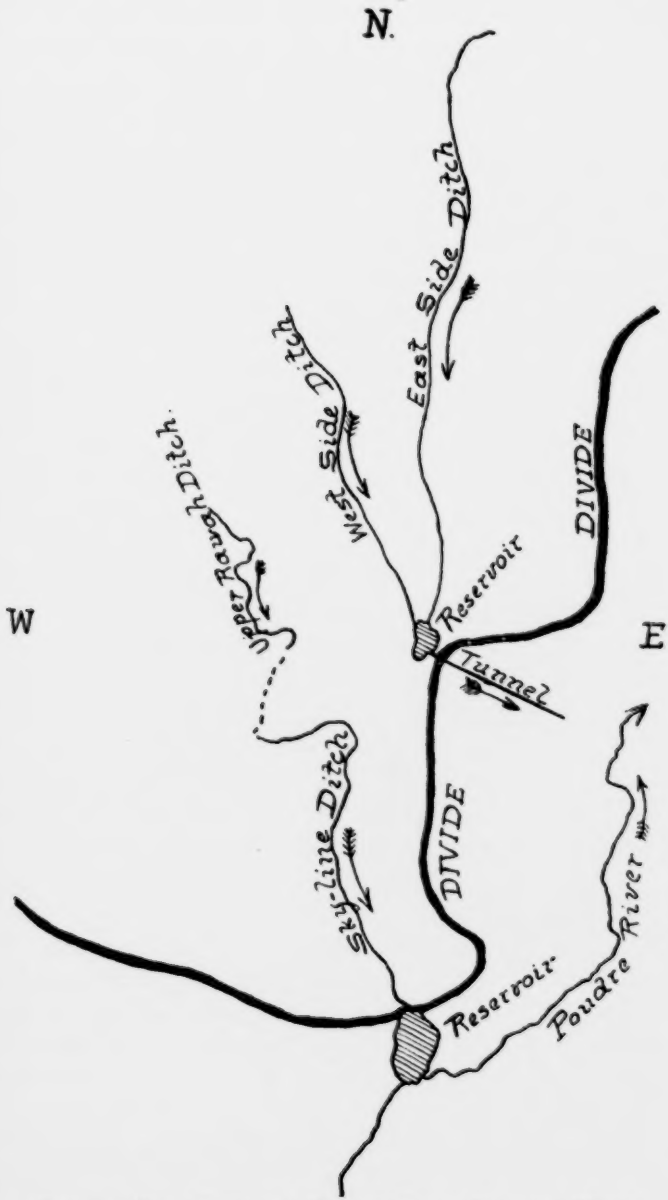
2. The Laramie River, Sand Creek and Lone Tree Ditch (in connection with the Reservoir near Glendevey) designed to collect the waters of the Laramie at a point near the southeastern corner of Township 10, Range 76, and carry them by canal north into Wyoming, then east across Shell Creek and Sand Creek, and south into a branch of the North Fork of the Poudre in Colorado.

3. Two collecting ditches (the East Side Ditch and the West Side Ditch), to gather water from both sides of the head waters of the Laramie and convey it with as little fall as practicable in a southerly direction to the main stream, and thence through a tunnel to a branch of the Poudre.

The defendants' map attached to the Answer significantly omits to show the proposed Laramie River, Sand Creek and Lone Tree Ditch with its Reservoir (sometimes called the Detour Ditch), but does show with other laterals the particulars of the Skyline and Tunnel diversions. The Detour Ditch was the last of the projected diversions to be surveyed and filed in the series of filings made in the office of the State Engineer, and so far as any public declaration was concerned, represented the final decision of the promoters to adopt that method of diversion rather than any of the others previously placed on record. We may for the present, however, dismiss the Detour Ditch diver-

sion from consideration since nothing has been done upon it in the way of construction, and according to the testimony introduced by the defendants it has been definitely and finally abandoned as impracticable.

This leaves for present consideration the two general methods of diversion of those enumerated above, which we may conveniently call the Skyline extension and the Tunnel. In order to aid in distinguishing these two methods of diversion from each other we have traced their essential units from the map attached to the Answer, and the accompanying sketch is made from such tracing.



SKETCH OF UPPER PORTION OF GREELEY-POUDRE DIVERSION WORKS
Showing Two Independent Methods of conveying water from the Laramie to the Poudre by the constructions begun by the defendants.

That these two proposed diversions have naturally and properly speaking no connection with each other is obvious from an inspection. The significance of this visible difference or dissociation will be understood when attention is called to the fact that all of the work done by the defendants and their predecessors prior to the very late months of 1909, having for its object the diversion of Laramie River water, was done upon the Skyline Extension and none upon the Tunnel project. The two projects had the one common purpose of diverting water from the Laramie to the Poudre. They are not, however, at all comparable in the magnitude of their respective works, the extent of territory drained, the cost of construction, or the volume of water to be realized; the most that can be said—indeed, the most that the defendants attempt to say, as we understand it—is that the Skyline Extension could be inexpensively and quickly made, and would furnish a revenue from which the Tunnel works could later be constructed and the principal diversion made.

The testimony of the witnesses offered by the defendants to show the origin, history and progress of the plans to divert water from the Laramie, were adroitly and industriously marshalled to blend together in seeming unity all of the various and variant projects as parts of the single diversion now undertaken. When analyzed, however, it clearly appears that from the time of the commencement of actual construction on the Tunnel diversion works in the latter part of 1909, nothing has been done on the Skyline Extension. On the other hand, prior to the latter part of 1909 all of the work of construction was done upon the Skyline Extension and none upon the Tunnel project. Along with the Detour Ditch, the Skyline Extension appears

to have been consigned to the scrap heap as soon as the promoters were really prepared to go ahead with the Tunnel diversion.

Moreover, the work upon the Skyline Extension, such as was performed, was intermittent, and in comparison with the ambitious plans of the promoters, insignificant in amount and cost. Such construction as was done, although certain portions of the project are said to have been completed, was never put in use, though it is claimed to have been in condition for use at least as early as 1907 and probably in part in 1904.

As the evidence offered by the defendants in support of these projects was quite voluminous, and as they appear to attach much importance to it, we here set forth at some length references to the material portions. It will be found to deal very largely with successive surveys, protracted over a period of more than seven years; with inquiries as to the source and volume of water supply which seem to have comprehended investigations at every source except the one most obvious and convincing source—the examination of the streams and the measurement of the water; with search for an available body of land and of prospective purchasers to market the supply; with the pursuit of capital and capitalists to furnish the means of construction; and with negotiations for carriage, franchises or other rights to convey and distribute the water after it should finally be delivered into the Poudre.

Wallace Link is the witness to whom is assigned the credit for discovering the projects. Link received his inspiration in 1897. While hunting deer he observed that the Divide was narrow and the Poudre considerably lower than the Laramie in that vicinity, and estimated that a mile and a half tunnel would divert

a considerable supply of water (pp. 1929, 1930). Link was then ranching in the Upper Laramie Valley in Colorado, and he subsequently sold out and settled under the Fossil Creek Reservoir about five miles southeast of Fort Collins on the south side of the Poudre River and there became acquainted with Abraham Akin, to whom in 1902 he disclosed his plan. (pp. 1930-1931). In speaking of the project Link says:

> "We adopted a method by which we were to build a part of the system first and employ the same to demonstrate the flow which was obtainable, and also to assist in making money for further promotion. After our first trip to Link Lakes and over that country we thought that the first thing to do would be to build this Ditch and connect it up with the Skyline Ditch, as this being a unit of the whole *would retain our franchise and as well give us revenue to proceed in the construction of the work.* It was the cheaper part as well as the best revenue earner of the whole proposition. The idea was to connect with the Skyline Ditch and turn it into the Chambers Lake and into the Poudre." (p. 1932-1933). * * * * "My plan in developing this work was to commence near the point of intersection with the Skyline Ditch and extend the line of that ditch northwesterly as funds for that purpose were obtained, in order to tap the drainage lying above the ditch line, and to carry the water from that area through the Skyline Ditch into the Valley. * * * We originally planned to use some of the water diverted through the Upper Rawah Ditch and Skyline Ditch into the Poudre River works, either directly or through an exchange system, and to sell the rest of it for a supplemental supply for other lands, and thereby secure funds to help work out the rest of the Laramie River diversion system, including the Tunnel. This plan has not been

carried out, and no water was sold at any time." (pp. 1994-1996).

Link and Akin viewed the ground in July and commenced a survey August 25, 1902, of the Link Lake Ditch, later called the Upper Rawah Ditch (pp. 1934-1935). The filing based on this survey was made October 15, 1902, and is exemplified in Plaintiff's Exhibit N, which is not printed in the Abstract but is filed with the original transcript. (p. 1835).

Throughout the testimony of Link (pp. 1920-1924, 1936-1939, 1941-1944, 1958, 1960), as well as in the testimony of the witnesses, Wortham, Hedke and Duval, much space is taken for the purpose of showing the difficulties of terrain, climate, situation, etc., in prosecuting construction work on the head waters of the Laramie. Attention is called, however, to the fact that this testimony (more particularly that of Link) applied to the site of the Skyline Extension, that is the Upper Rawah Ditch, and not to the locality of the lower works connected with the Tunnel diversion proper, which is located near the floor of the valley at a much lower altitude. The promoters chose the work presenting these special difficulties and directed their efforts to that work at the intervals when it was under prosecution from 1902 to 1909.

In 1903 Link worked on a road leading from the floor of the Valley to the elevated region of the Skyline Extension project. (pp. 1941-1945). In March, 1904, Link and his associates made a preliminary survey of the Tunnel site, and in May began the final surveys for the Tunnel and connecting works under Zac T. Duval, who also re-located the Upper Rawah Ditch. (pp. 1947-1952). After describing this work Link

states that "all surveys of all ditches now in course of construction were completed during the Summer of 1904." (p. 1952). * * * "Surveys for the system were entirely completed in 1904 (p. 1990)." Construction work was commenced in 1904 and about 6000 lineal feet of excavation done on the Upper Rawah Ditch, the total amount expended for surveying and construction that year being $13,000 to $14,000. (pp. 1953-1959.)

In 1905 no construction work was done, and the surveying appears to have been limited to an estimate of the construction done during the preceding year (p. 1964). In 1906 Link states that the work of financing, surveying and planning was going on continually. In that year he disposed of his interest and ceased to be connected with the projects (p. 1965). "No further work was done in 1905 or 1906." (p. 1996). In a summary review of the progress of the enterprises during the period of his connection with them, Link says:

> "Mr. Hibbard had the duty of finding capital for the enterprise, and up to the time I sold out, he had not succeeded in finding it. When I was in the enterprise we had not considered any $5,000,000 expenditure. We had counted only on the cost of the Laramie River project, and we had not gone into the Poudre Valley end of the matter, and when I sold out I had no interests in the projects upon the Poudre River, my interest being confined to the plan for diverting water from the Laramie River.
>
> The cost of the work which I had planned was estimated at about $2,000,000. In 1903 no money was expended on clearing; in 1904 about $14,000 was expended on construction work and clearing, but not including surveys, and no money was expended on construction work in 1905. I cannot

say as to 1906. I do not know how much was spent on engineering in those two years. Up to the close of 1906 the entire amount expended on construction work was $14,000, but this does not include expenses of roads and cost of transportation, moving, and establishing camps, all of which I believe should be included in construction work, and which would bring the total expenditures in the mountains up to $18,000 or perhaps $20,000. This work was practically all done on the Upper Rawah and Link ditches. No considerable amount was expended on the Lower Rawah or the West Side ditches nor on the tunnel or reservoir, but about $1,300 or $1,400 was expended on the East Fork Reservoir." (pp. 1987-1989).

It is to be noted that the East Fork Reservoir mentioned was definitely abandoned and is not a part of the present system. (p. 1820).

Link explains that they had an arrangement with the owners of the Skyline to carry for a percentage the water to be supplied by the Upper Rawah Extension. The Skyline Ditch had a capacity of only about 130 second feet, which during May and June was fully taken up in carrying its own water, so that none of the new supply could be carried through it during that time, but would have to be carried outside of that period. (p. 2002). Yet the Upper Rawah Ditch, as is elsewhere shown in the testimony, was planned to carry 224 second feet. It is contended, we understand, that this fact shows that the Upper Rawah Ditch was planned as a part of the Tunnel system. Inasmuch, however, as only about one-sixth of that ditch has been completed (p. 2005) and the ditch was never put in use, and so far as construction was concerned appears to have been definitely abandoned in 1907,

a much more probable explanation would be that the Upper Rawah Ditch was planned with an excessive capacity to compensate for the exceptionally large seepage loss expected, and to guard against the destruction of the ditch from overflow, which the testimony indicates did occur in 1905 or 1906, or to store flood water in the projected East Fork Reservoir (later abandoned) to propitiate lower appropriators on the Laramie River for the diversion of their flow during the latter part of the irrigation season.

The testimony of Abraham I. Akin generally corroborates that of Link for the period during which they were associated together from 1902 to 1906. (pp. 2038-2041, 2049, 2052, 2070, 2072). Akin, however, continued as an interested party after Link sold out. Speaking of the Laramie River diversions he says:

> "There was no construction work done in that country in 1905 nor in 1906, and I cannot give any approximate statement of the amount expended upon work in the Laramie Valley in 1907. In 1908 there were four men employed in the Valley repairing the ditch, these men going up there in June and staying until after the tunnel was commenced in December, 1909. These men looked after the ranches on the river, cared for the road up the river, kept the ditch in repair, and after December, 1909, commenced clearing the right of way for the diversion ditches on the Laramie River. Until December, 1909, these men did no construction work." (pp. 2072, 2073).

Charles R. Hedke, who was the engineer employed by the promoters from 1907 until February, 1911, testified voluminously concerning surveys, water supply and distribution investigations, the campaign for cap-

ital, negotiations with other ditch and reservoir owners, and the development and progress of plans to secure water from the Poudre River drainage proper. He has much to say euphemistically of the progress in construction. On this subject his testimony is exceedingly mystifying, vague and baffling so far as any attempt is made to distinguish or specify what was done on the Laramie River diversion projects, from what was done on the Poudre Valley system and on general promotion work. A careful review of his testimony, however, brings into relief certain salient facts. He testifies that in 1905 and 1906 no work was done that he knows of in the Laramie Valley (pp. 1793-1794); that in 1907 about three miles of excavation was done on the Upper Rawah Ditch (pp. 1794, 1795) at a cost of about $47,000 (pp. 1754-1757), but that no other construction work was done in the Laramie Valley (pp. 1794, 1795). In the Summer of 1908,

> "The construction work in the Laramie Valley consisted of the completion of some small portions of the upper Rawah Ditch. We had a small number of men up there all summer, but I cannot say how many were employed nor for how long. I do not suppose the amount expended for that work exceeded several thousand dollars. Some incompleted sections of the ditch were finished, loose boulders and slides were taken out of the ditch and overflow sections made and a measuring device was put in and some clearing was done. No other work was done in the Laramie Valley in 1908, and I do not believe that any work has been done upon the upper Rawah Ditch since that time." (p. 1798).

> "No construction work was commenced in

1909 prior to the making of the contract between the Greeley-Poudre irrigation district and the Laramie-Poudre Reservoirs and Irrigation Company. Appropriations were then made for the construction of the tunnel. Camps were built and a power plant was built, and a few days after Thanksgiving Day or about December first, 1909, actual construction work commenced on the tunnel. I am not able to recall definitely, but I believe that some work was done upon the ditches in the Laramie Valley in 1909.

"Construction work was commenced on the East Side Collection Ditch in the Laramie Valley in 1910, commencing about May first, I believe, as early as the men could get in. Work on the West Side Collection Ditch had commenced before that time, and I believe they worked upon tunnels along that ditch some time during the winter of 1909 and 1910. The roads were kept open so that supplies could be carried in for that work, and there were perhaps 30 or 40 men engaged in it, and I believe that force was maintained throughout the winter, supplies being hauled in from the railroad in Wyoming, about 65 miles, I believe.

"The work on the East and West Side Collection ditches continued until October 1st, 1910, and I believe a little was done after that date on the West Side Ditch." * * * (pp. 1800-1802).

"The work was pushed in 1910 on the mountain system with all the men that could be obtained, and was closed down on October 1st, 1910, after which time work was performed only on the east end of the tunnel, excepting for the construction of several hundred feet of tunnel work upon the West Side Collection Ditch, which was performed by a few contractors in the winter of 1910-11. In February, 1911, I severed my connections with the Company, and no more work

was done under my supervision and observation (pp. 1805-1806). * * * *

"*Prior to October, 1909, all the work that was done in the Laramie Valley was done upon the upper Rawah Ditch, and all that was done in 1909 or later was upon the lower West Side Ditch and the East Side Ditch.* The reason for this was that in the early course of this project it was thought necessary to secure some current revenue immediately, and in 1906 a carriage right through the Skyline Ditch, and the construction work on the upper Rawah Ditch was undertaken so as to secure a property from which this current revenue could be derived, through the ten year period in which the major system would be constructed, but in 1909 the general contract was let which provided for the immediate construction of the whole system which would result in an immediate revenue *so that it was no longer necessary to carry on the upper Rawah project.* The idea leading to its early construction was abandoned, but the line itself was not abandoned, it being still intended under the general contract of 1909 to complete that work.

"The upper Rawah ditch may be considered an extension of the Skyline Ditch, and was originally planned to collect the water from above the ditch and deliver it into the Skyline Ditch, for the purpose of assisting in the development of the larger proposition on the Laramie. *It was only a means to an end.* It would carry it over the watershed into Chambers Lake. The surveys were made with this end in view, and also with the end in view to use the upper Rawah Ditch to carry water into the west fork of the Laramie River above the tunnel whenever the tunnel should be constructed." * * * * * *

"The upper Rawah Ditch, if completed, would drain a watershed containing from ten to twelve square miles, which is about one-sixth of the area

drained by the system now under construction." (1808-1811).

Zac T. Duval was engaged in the surveys of 1904, which he describes, as well as the construction in progress that year and the changes made subsequently in the plans prepared by him. In 1905 he made a survey of another tunnel thus completing the 1904 survey. (pp. 1882-1897). Duval, at some length, describes the conditions rendering the work difficult. (pp. 1895-1897). He states that the elevation of the upper Rawah Ditch is 1700 to 1800 feet higher than the elevation of the tunnel and its connecting ditches. (p. 1895).

John R. Wortham became the engineer of the Greeley-Poudre Irrigation District in June, 1909, and continued to act up to the time of taking of testimony (pp. 1606, 2099). The District was organized in April, 1909, the construction contract dated September 8, 1909, and ratified and the bonds voted by the District in October, 1909. Construction of the power line to furnish power for the tunnel construction commenced the latter part of October. Preliminary excavation began about Thanksgiving Day, and the first shot in the Tunnel proper was fired on Christmas Day, 1909. This witness also states

> "The only work performed upon the system prior to my connection with it which could be noted upon my inspection was the work upon the Upper Rawah Ditch and the work upon the Canal in the Poudre Valley, although there might have been some money spent on maintenance and operation" (p. 2099-2101). * * * *

> "Excavation on the East Side Collection

Ditch commenced about April, 1910, and on the West Side Collection Ditch about the first of December, 1909, and work was stopped on both ditches on October 1st, 1910." (p. 2126).

The witness states that the East Side Ditch is 43½ per cent. completed, and the West Side Ditch, 48½ per cent., while the approach to the tunnel at the upper end is 79 per cent. completed. (pp. 2124-2126).

D. A. Camfield shows how the funds were provided for the construction of the tunnel system. He became interested in the Laramie-Poudre Reservoirs & Irrigation Company in the fall of 1908 (pp. 2159-2170), and spent $15,000 in the fall of 1908 and the spring and summer of 1909 to find a route for a ditch around the mountains (Laramie River, Sand Creek and Lone Tree Ditch). He organized the District in April, 1909 (p. 2170), and the contract for construction was dated September 8, 1909; the work was proceeded with that fall (p. 2161), the bonds having been sold on payments to begin in March, 1910 (p. 2162).

The foregoing references are believed to cover all of the material evidence relating to the plans, surveys and construction pertinent to the Laramie River diversion projects. A large part of the testimony of the same witnesses and others is devoted to projects for the collection and diversion of water from the flow of the Poudre River and its tributaries, and some of the tributaries of the South Platte. Much of the testimony of the witnesses named is devoted to showing the protracted and strenuous efforts to secure capital for these constructions—excuses for not prosecuting the work, rather than facts showing such prosecution. It is not believed that these efforts can be regarded as a substi-

tute for the diligent prosecution of the construction work, which alone could support the claim of priority by relation to any date prior to the commencement of actual construction about December 1st, 1909.

2 Kinney on Irrigation, 1276.
Cole vs. Logan, 24 Ore. 304.
Rio Puerco Irrig. Co. vs. Jastro, 19 N. M. 149.

In the latter case the court said:

"The authorities all agree that the mere lack of means with which to prosecute the work is not a sufficient excuse for delay."

In Cole vs. Logan, the court said:

"It would be a most dangerous doctrine to hold that ill health or pecuniary inability of a claimant of a water privilege will dispense with the necessity of actual appropriation within a reasonable time, or the diligence which is usually required in the prosecution of the work necessary for the purpose. We find no recognition of such a doctrine in the law; nor are we disposed to adopt it as the rule to govern cases of this kind."

Nor are the defendants in any better position on the facts with respect to the voluminous excuses offered in the testimony concerning the climatic and topographical difficulties surrounding the work. Most of the testimony on this subject was directed as we have shown to the special conditions surrounding the upper Rawah Ditch on account of its great elevation and inaccessibility. These conditions, however, would not apply or applied only in a much less degree to the work on

the tunnel proper and its connecting ditches—the real tunnel diversion system.

It is not to be overlooked that when this latter work really was begun, it was commenced at the beginning of winter in 1909, and that work was prosecuted continuously and with great vigor as the witnesses show throughout that winter, and on the tunnel throughout the winter of 1910 and 1911. Mr. Link testifies with reference to the accessibility of this work, and that a road was constructed in 1876 the entire length of the Valley, which was subsequently used by ranchmen, and usually is open during the winter (pp. 1990-1991). As Link himself lived on a ranch in the upper Laramie Valley in Colorado for many years, his testimony on this subject was doubtless given advisedly and may be relied upon.

However, the plaintiff introduced further evidence on this subject of a convincing nature. R. D. Stewart was Chief Engineer and Superintendent of the Laramie, Hahn's Peak & Pacific Railway Company from 1902 on. This railroad extends across the same range of mountains near the Colorado-Wyoming line at an elevation of 9200 feet. Construction was prosecuted on this work during the winters of 1909-'10 and 1910-'11, and to some extent in the winter of 1908-'09. The witness has been on the Laramie River headwaters and thinks that even on the Skyline Ditch location it would be entirely practicable to carry on rock work during the winter season. (pp. 4380-4381). In January, 1914, the railroad hauled up a car or two of outfit for work on the Greeley-Poudre Tunnel (p. 4384). For years prior to the building of the railroad over the mountains, freight was hauled over the mountains every winter. (p. 4387). George Trabing was for eight years con-

tractor on the stage line crossing the same range of mountains between Laramie and Walden, Colorado. This was a daily line which ran regularly each winter and did not miss a trip in the last twelve years. The road was generally travelled and freight hauled over it through the winter. There was also a stage line running up the Laramie River from Jelm to Gleneyre and a postoffice beyond at Glendevey. This line ran three times a week and did not miss a trip. The witness had been at Chambers Lake (near the Laramie-Poudre divide) and found a good road running all the way up the river, which he thinks would be practicable to travel with sleds in the winter season. (pp. 4388-4390).

N. K. Boswell has lived in the Laramie Valley since 1868 and since 1869 has owned a ranch on the river at the Wyoming-Colorado line. There is a well-travelled road running up the river to the Chambers Lake district which has been travelled a great many years. Logging and timber cutting was done there in '67 and '68. The river valley is pretty well settled for about twenty miles above the Wyoming line and through the winter season people haul in supplies, etc. There is nothing to prevent communication to the tunnel in the winter season. (pp. 4398-4400).

The evidence on both sides then concurs on the material physical facts pertaining to the region where the diversion works connected with the tunnel were to be constructed. Plainly the claim is incredible that physical obstacles prevented this work from being done immediately after the so-called final surveys were made in 1904. The major part of it was actually done largely during the winter of 1909-10. There is no reason of this character why it could not as well have

been done in the winter of 1904-05, or in 1905-06. What is said by the witnesses concerning the lack of means on the part of the promoters to do this work prior to 1909-10 is supported by what they actually did in the comparatively insignificant construction on the Upper Rawah Ditch to adapt a cheap expedient for diverting water to earn revenue in the hope that they might thus be enabled at some future time to construct the tunnel works.

7. The Detour Canal

We have already directed attention to the series of filings made in 1902-1909 setting forth the varying plans for diversions from the Laramie. Plaintiff's Exhibits N, O, P, Q, R, S, and T were introduced (pp. 1835-1839), and are to be found with the transcript but are not printed with the abstract. These Exhibits are certified copies from the office of the State Engineer of Colorado of the various filings made by the Colorado promoters.

Exhibit N, filed Oct. 15, 1902, as already stated, represents the survey of the original Link Lake Ditch and Feeders, subsequently designated as the Upper Rawah Ditch.

Exhibit O, filed May 9, 1904, represents the East Fork Ditch and Reservoir which, as described by the defendants' witnesses, forms no part of the present enterprise. It was planned to take water from the West Fork to the East Fork above the Tunnel site and store it there in a reservoir.

Exhibit P, filed October 6, 1904, represents the original conception of the Tunnel Diversion with its feeders.

Exhibit Q, filed September 24, 1906, shows a greatly modified plan of this project.

Exhibit R, filed July 8, 1908, represents the Laramie River Reservoir, which it was designed to construct in the river channel at a point near Glendevey some miles below the present tunnel location.

Exhibit S, filed September 28, 1908, represents the Laramie River, Sand Creek and Lone Tree Ditch (Detour Canal) which, as already described, was to carry the water from the Laramie River reservoir just mentioned around the mountains into a branch of the Poudre, and thus avoid the tunnel altogether. (pp. 1835-1839).

Exhibit T, filed January 8, 1909, represents the omnibus plan of all the systems and all the projects as then conceived.

It will be found from an examination of these maps and the descriptive matter connected with them that the successive filings thus made from year to year were attempted to be tacked on the original filings made in 1902, claiming all prior surveys and filings as parts of the system, and professing to be amendments of the original plan without loss of the claim of priority. The evidence of the defendants' witnesses as to the good faith of these filings is conflicting. Indeed it is obvious from a comparison of the plans that they were alternative and inconsistent. A mere conspectus of the aggregate of these plans refutes the claim that they were all made in good faith to be constructed as parts of a single system.

Mr. Hedke first says (p. 1834) that:

> "From time to time as surveys were made of different propositions of irrigation system, maps and

field notes were filed in the office of the State Engineer which represented plans of the company at the time of the filings as proposed by each individual unit."

Yet immediately afterward, the same witness said (p. 1839):

"It was never intended to construct all the works shown upon these maps. The maps cover and bring together all the previous filings, and show all the different means of accomplishing the same general end—the irrigation of the land in the Greeley-Poudre District. Many investigations were made to determine the best means of accomplishing this end, and these were incorporated in the various filings and in this map (Exhibit T, filed January 8, 1909), which was the last filing made by the company. Both the Tunnel and Sand Creek Ditch, which runs through Wyoming, and the Glendevey Reservoir, are shown on this map. It was known at the time the map was filed that the cost of the Sand Creek Ditch was prohibitive and that no possible relations could be brought about which would make it feasible. It was included in this map because at all times there were interests adverse to this system. The interests seeking to obtain some foothold in the Company so that it was necessary to protect what was done by filings, so that if the matter should come up in the future there would be record evidence of what was at one time covered."

Yet although this witness says that it was known when the last map was filed that the Sand Creek Ditch would not be constructed, the witness, Camfield, as already mentioned above, at least strongly implies in his testimony that the survey of the Sand Creek Ditch,

which was begun in the fall of 1908 and continued through the spring and summer of 1909 at a cost of about $15,000, was made in good faith to find the possible route for an actual ditch around the mountains to avoid the tunnel and cover more land. (p. 2170).

It seems to us to be plainly deducible from all of the evidence that the Laramie River Tunnel Diversion project which was said to have originated in 1902 and to have become fixed and definite by the final surveys of 1904, cannot be regarded as an enterprise conceived and begun in 1902 and prosecuted with diligence to completion so as to give the defendants the benefit of the doctrine of relation which would establish its priority as of 1902 against other diversions begun and prosecuted with all diligence to completion and put in use in the intermediate period. We do not know of any rule or custom, and we are not able to find any authority, to support such a claim. In point of fact we think the inference is plain and irresistible that such work as was performed on this project between October, 1909, and 1911 was directly attributable to the large construction work undertaken on the Laramie River in Wyoming early in the year 1909 and prosecuted with all possible diligence to completion. Having dallied with their project for seven years with only fitful and wholly inadequate efforts to complete or use any part of it, the defendants could not fairly ask that the people in the valley of the Laramie should await their action indefinitely. If the citizens of Wyoming were chargeable at all with notice of what was contemplated in Colorado, they were also entitled to take into consideration that the long contemplation without substantial action or fruition rendered the Colorado diversions extremely indefinite and uncertain.

8. The Poudre Valley System

An important element in the claims of the defendant promoters yet remains to be considered. We refer to what is often spoken of in the testimony as the Poudre Valley system or Poudre Valley diversion, which fills a large place in the project for the irrigation of the lands in the Poudre Valley District as now outlined and explained by the defendant promoters. In its final form it is described as the Plains Division of their works. It is described in detail by Mr. Wortham (pp. 1699-1711). It is made up of many units, more or less completed and to some extent in use, designed and adapted to collect water from the Poudre River and its tributaries and tributaries of the South Platte below the junction and convey it to the Greeley-Poudre District lands. The parent trunk is the Poudre Valley Canal, which was commenced about 1901 or 1902 with the single design of diverting water from the natural flow of the Poudre at a high point above the plains and above other ditches, and conveying it eastward for an indefinite distance to water lands lying north and east of the river. (pp. 1735-1737). The witness, Hedke, was connected with this project long before he became connected with any of the Laramie River Diversion schemes. As late as 1904 it was being repaired and reconstructed, but was still unfinished (pp. 1739-1741). Negotiations subsequently took place between the promoters of the Laramie Diversion projects and the owners of the Poudre Valley Ditch, the exact nature of which it is difficult to trace in all respects, but in December, 1909, as Mr. Camfield testifies, the Laramie-Poudre Company purchased the shares in the Poudre Valley Ditch which were owned by the North Poudre

Company, completing the payments in January or February, 1910. (pp. 2162, 2172). As this testimony is quite specific and definite and as Mr. Camfield was the principal organizer of the District, and the chief promoter of its enterprises, his testimony as to the time when this transaction took place is probably to be taken rather than that of Mr. Hedke, who states that the purchase was made in 1908 (p. 1789). The Poudre Valley Ditch did not then serve any lands within the present Greeley-Poudre District (p. 1786). Indeed, it does not seem to have been designed for any particular purpose except to secure and store surplus water of the Poudre (pp. 1735-1737) and in 1904 was badly washed out by the flood waters (pp. 1739-1740).

We are considering with some minuteness the Poudre Valley Ditch as it represents the origin of the project to secure and use the waters of the Poudre River, and its tributaries. On the defendants' map this ditch appears as taking its departure from the Poudre River near the middle of Township 8, Range 70, and extending thence easterly to a connection with the series of Reservoirs north and northeast of Ft. Collins, and some distance from the Greeley-Poudre lands. As the present project is described in the testimony above cited all of the Laramie River waters as well as the waters of the Poudre must pass through this ditch; and it appears to be an indispensable link to connect the Laramie River Diversion works with the Greeley-Poudre lands or with the Poudre Valley system, so-called, of ditches and reservoirs. As the rights of the defendants in this ditch were not acquired until December, 1909, (p. 2172), it would appear that the Laramie diversion projects could not have been wedded to the Poudre Valley diversion projects or to the Greeley-Poudre lands before that time.

Other facts established by the defendants' testimony corroborate this conclusion, and indicate very clearly that the promoters who sold their projects to the District under the contract of September 8, 1909, and agreed to complete the construction, regarded the Laramie diversion projects as separate and distinct from the Poudre Diversion projects and reserved to themselves the option to complete and turn over the latter without assuming any responsibility for the former. The witness Hedke testified on this subject as follows:

> "The Greeley-Poudre Irrigation District's system is divided into two general divisions, the 'Mountain Division', and the 'Plains Division', and by Paragraph 15 of the general contract of 1909 it was provided, 'that the work of completion to be done by the Company, meaning the construction work, hereunder, shall for the purposes of this contract be classified into two divisions, namely, 'The Laramie River Division', and 'The Plains Division', and each of said general divisions may and shall for the purposes of this contract and for the payments to be made hereunder be further divided both numerically and by name designated as hereinafter set forth; and relative hereto, it is mutually understood and agreed that this contract shall be taken and held to be *severable* as to said mentioned divisions and sub-divisions hereinafter described as aforesaid, and *not entire* as to the whole; and the Company shall be paid for each part of the contract, payment upon the entire contract price for construction work as set forth in the following schedules, and if work as described in schedule No. 1 shall be completed and sold to the District, then that schedule shall be followed and if the works described in schedule No. 2 shall be completed and sold to the District, then

that schedule shall be followed; provided, that upon each monthly estimate upon any of the uncompleted portions of the works to be completed and sold to the District hereunder there shall be paid to the Company 85 per cent. of the estimate thereon for the work done and materials furnished during the month upon which such estimate is based, and the remaining 15 per cent. shall be retained until the completion of the works upon which such estimate is made, and the amount to be estimated and paid shall be such amount as the value of the amount done shall bear to the total amount to be done upon the work upon which the estimate is based." (p. 1820).

The witness then enumerates the units of the Plains Division and says:

"This system has two distinct and independent sources of supply; that from the Laramie River and that from the Poudre River basin and the tributaries of the South Platte, and it was so designed that the Poudre Valley Canal could divert water from the Poudre River and also from the northern tributaries of the Poudre intercepted by the canal and from the tributaries of the South Platte as far east as Crow Creek and intercepted by the canal wherever there was surplus water. We estimated that the amount of water available outside of the Laramie River source would be between 80,000 and 100,000 acre feet per annum as an average. * * * * * The Poudre Valley Canal diverts water from the main Cache la Poudre River in Section 15, Township 8, Range 70, and is designed, with its extensions, to carry all of the water supply to the lands of the Greeley-Poudre Irrigation District. Its point of diversion is such that it can divert all of the surplus waters of the Cache la Poudre River, the

Big South Fork and its tributaries, the Little South Fork and its tributaries, the North Fork and its tributaries, and the other tributaries of the main stream above the point of diversion. It also intercepts and collects the waters of Hook and Moore Creek, Park Creek, Box Elder Creek, Sand Creek, Coal Creek, Rattle Snake Creek, Lone Tree Creek, Little Owl Creek, Robinson Creek, Owl Creek, Eastman Creek, another Coal Creek, Wild Horse Creek, another Sand Creek, and Crow Creek, as well as all other unnamed creeks and channels west of Crow Creek draining a portion of southern Wyoming and all that portion of northern Colorado lying north of the Poudre River and within its drainage basin, and also that portion of northern Colorado and Wyoming lying north of the South Platte River and west of Crow Creek." (pp. 1821-1822).

Both Mr. Hedke and Mr. Wortham testified in effect that of the two sources of supply that from the Laramie River was more certain and dependable than that from the Poudre and its tributaries. Their testimony, however, clearly indicates that this distinction was conferred upon the Laramie for the reason that the defendants counted on diverting all of the flow of that stream which they could intercept, without regard to the rights of appropriators below, while in diverting from the Poudre and its tributaries, they would be constrained to respect the rights of prior appropriators. (pp. 2083-2085, 2121). They see nothing inequitable in diverting Laramie River water regardless of the rights of others and carrying it a distance of 190 miles from its source with the consequent great waste of one-third (pp. 1828-1829, 1851), in preference to utilizing the waters of the Poudre which were their original and primary reliance.

The linking up of the Laramie River projects with the Poudre River projects then seems to have been a late realization of the defendants. It is ingeniously pressed in the presentation of their case as an early development tending to consolidate and perfect its appropriation from the Laramie River from the date of the first filing. Work on the Poudre project is thus made to do duty for the Laramie project, and a semblance of diligence in construction is thus created for a combination which could have had no tangible existence until the latter part of 1909, long after the latest date when the Wyoming appropriations could possibly be said to have taken effect.

It is interesting to throw upon this picture the light of the testimony of Wallace Link as to the scope of his project in 1902. Speaking of that period he says:

> "At that time we did not know upon what land we should use the water. We first had in mind the use of a part of the water upon land in the neighborhood where my farm was located (south of the Poudre). There is a general feeling on the part of the owners of land under all of the ditches in the Poudre Valley that more water is needed, and generally speaking, it was the shortage of water in the valley that led me to consider this proposition. My idea was to obtain a supplemental supply in addition to the water furnished from the Poudre River, and to use this, if there was enough, upon other lands." (pp. 1983-1984).

Again he testifies:

> "It was recognized by me and by my associates that it would be necessary to locate ditches and works upon plains of Poudre Valley as well as to construct ditches in mountains.

"Poudre Valley Ditch had been constructed out of mouth of Poudre Canon in 1902. I have viewed lands that might be served from extension of this canal." (p. 1961).

Further he testifies:

"We originally planned to use some of the water diverted through the Upper Rawah Ditch and Skyline Ditch into the Poudre River ourselves, either directly or through an exchange system, and to sell the rest of it for a supplemental supply for other lands, and thereby secure funds to help work out the rest of the Laramie River diversion system, including the tunnel. This plan has not been carried out, and no water was sold at any time." (p. 1996).

Still further he testifies:

"We estimated that it would cost us $30,000 to construct a ditch which we surveyed in 1905, which we called the High Line Ditch, covering lands on the south side of the Poudre River and south of Fort Collins. The construction of this ditch was not still in contemplation at the time I severed my connections with the enterprise. The other possible construction work in the Poudre Valley which we contemplated was the extension of the Poudre Valley Ditch, which Mr. Hedke and I surveyed in 1905 and 1906, but the survey of which was not completed while I was interested in the project." (pp. 2008-2009).

Finally Link testifies:

"When I spoke of the water being turned into Poudre Valley to supplement supplies there, I did

not mean it was to be applied to lands already irrigated. It was intended for new lands as well as supplemental supplies for old lands. It was not necessary at the outset to choose the particular area on which the water should go. There is large area of arid land in Poudre Valley fitted for agricultural purposes. There is demand for water as soon as it is obtainable by any possible arrangement. As new waters are obtained, old ditches are sometimes extended to cover lands possible of reclamation at their lower ends. Ditches sometimes are built to take in new areas. The supply of land fitted for agriculture by irrigation is very great. When we did our work in 1902 we knew there was a large area which could be served by ditch on south side of river. They have since covered a portion of this area through the Louden Ditch. We also figured on something like 17,000 acres south of river, and so had Mr. Tenney and Mr. Duvall survey ditch around about Pleasant Valley Ditch. * * * We also knew there was area which could be reached by ditch on north side of Poudre River and lying above the irrigated area of the valley." (pp. 2026-2027).

Upon the whole showing the conclusion is reasonable, indeed inevitable, that in August, 1902, the only work contemplated presently to be done was the extension of the Skyline Ditch; that the method by which the diversion was to be made was not by the tunnel but by open ditch over the divide; that the purpose to which the water was to be applied was wholly speculative and undetermined; that at least for some years the promoters were spying out the land for a possible market for the Laramie water and in this search considered from time to time many different potential uses; that whenever a decision may have been

finally reached by them as to the best market available, and whatever course the negotiations may have taken, the plan was not made final or definite until December, 1909, when they procured the controlling interest in the Poudre Valley Ditch, and the right to carry water through that channel to the Greeley-Poudre lands which had then been decided upon.

9. The Equality of Right in the Typical Development.

Reverting now to a subject suggested in connection with the new works in Wyoming, and especially in discussing the Lake Hattie System, we wish to direct attention to the fact that Colorado is denying to Wyoming an important right which she herself has freely exercised, and in the results of which she takes a special and particular pride.

Prof. L. G. Carpenter in different portions of his testimony dwells at great length upon the history and analysis of the extension of irrigation over the lands of the Poudre Valley from the earliest times. This development he says is typical of all irrigation development and is the natural and inevitable process observed wherever irrigation has been successfully practiced. He speaks of the period prior to 1870 when sporadic construction of individual small ditches taking water from the Poudre River and spreading it over comparatively small individual holdings brought under irrigation perhaps an aggregate of 10,000 acres; of the period from 1870 to 1880, when community or company ditches began to appear, merging some of the small appropriations and extending the cultivation to perhaps 80,000 acres; of the era when foreign capital was enlisted in larger constructions between 1880 and 1890, bringing

the aggregate area up to 135,000 acres; of the development of the reservoir system and the importation of water from other streams from 1890 to the present time when some 260,000 to 275,000 acres are served (pp. 1438-1443, 2259-2294, 2314-2316). The witness describes the gradual filling up of the interstices of the soil and subsoil through irrigation, the consequent return flow through seepage, and the spreading of a given quantity of water over additional land as the soil becomes filled and the water table rises, the requirements of a particular tract growing less from year to year, the extension of ditches and laterals to keep pace with this progress and the consequent increase in economy of use and the duty of water as irrigation develops (pp. 2317-2339, 2376-2379, 3007-3022). Mr. Armstrong reviews the irrigation development in the Poudre Valley in a similar way. (pp. 2457-2460). Mr. Camfield relates his extended experience of the same general effect (pp. 2139, 2150, 2151, 2154).

Prof. Carpenter contrasts the Colorado practice in this respect with that of Wyoming, which he is pleased to present as a rigid, unscientific, uneconomical system. (pp. 2315-2317, 2337). Needless to say we think the witness misunderstands the effect of the Wyoming system and practice. Whether this is true or not it is clear that the implication from his testimony and the argument based upon it by the defendants in this case would deny to Wyoming the benefits of a practice which is followed in Colorado, and which is said to be typical and universal in all successful irrigation development.

We think this contention denies the principle which this court has often declared, and which it expressly applied in the case of Kansas vs. Colorado, 206 U. S.

46, 97, where it was said that "one cardinal rule underlying all the relations of States to each other is that of equality of right. Each State stands on the same level with all the rest." And to paraphrase another expression in the same opinion (p. 104) as Colorado thus recognizes the right of appropriators to extend the use of the waters of a stream for the purposes of irrigation of other and additional lands, as this becomes possible with the saturation of the soil, she cannot complain if the same rule is administered between herself and a sister State. In other words, Colorado cannot consistently deny to Wyoming a right which she recognizes and enjoys for herself in determining the scope and limitations of the rights of an appropriator.

It needs only the substitution of names in the testimony of the Colorado expert witnesses to show that the process now going on in the Laramie Valley in Wyoming is in substance the same process which has created the wealth and enhanced the prosperity of the Poudre Valley. It is a process of economy, of increased use and production, of diminishing waste and raising the duty of water, and of developing the agriculture of the Laramie Valley in Wyoming toward the same end which has proved in Colorado to be of the highest benefit to the community. Without increasing the burden upon the stream, without infringing the rights of other appropriators, and without injury to anyone, but with benefit to all, the construction of reservoirs and the extension of ditches and the increased acreage of the irrigation in Wyoming, is proceeding in the natural and typical way which the defendants' witnesses have described. We think it would follow then that even if the later constructions in Wyoming were not prior to the proposed diversion in Colorado, the

defendants could not complain that they were being injured in any way by the use of these works, since no additional burden is laid upon the stream.

III. WYOMING PRIOR APPROPRIATORS HAVE ALREADY EXPERIENCED SHORTAGE OF WATER WHICH ANY DIVERSION BY COLORADO WILL NECESSARILY INCREASE.

It is shown without any dispute that the Wyoming appropriators of conceded priority have for many years actually used the entire flow of the Laramie River and have suffered a shortage of water repeatedly. The proposed added diversion in Colorado could, of course, have no other effect than to make this shortage more serious.

The ranchmen and farmers in Wyoming were questioned as to their experience in securing water, and all bore the same testimony—that they have not had enough water after the high water period. With respect to the Riverside ranch, a few miles above Laramie City, Winkler says (p. 282): "I don't think they are getting as much water as they did two or three years ago—don't have the results, don't have the hay there they usually have."

Benson, in discussing the same large ranch, testified (p. 326): "There was a shortage of water this summer, and usually a shortage in previous years during the latter part of the irrigation season. The ditches on this ranch while I was there were kept cleaned out and in good condition to run water. We run them to capacity when we could get the water."

Rickard, the owner of the Bush and Holliday

ditch above Laramie, testified (p. 502): "I have been short of water several years since I have been there. I did not have half enough this last season. The shortage was in the river. When there is lots of snow in the mountains we have plenty of water, but in some winters there is not much snow; then we are short of water. We were short of water in 1902, short in 1903, very short; this year we didn't have half enough. In other years we were a little short, but it wasn't so bad. There have only been two years when we had plenty. In all the other years we were more or less short."

John Biddick testified about the irrigation of his land under the Biddick ditch below Laramie and above the mouth of the Little Laramie: "It was not irrigated this year. There wasn't any water in the ditch this year. They took it all from us. The river wasn't high enough to irrigate any." (p. 905). "My land is largely pasture and has been during the past few years. We have been short of water; that is the reason." (p. 909). "I don't know who took my water this summer. In 1912, there wasn't any water then worth mentioning. In 1911 we had a little water." (p. 909).

W. P. Schott had owned a ranch above Laramie only four years, and thus relates his experience (p. 4137): "Had difficulty in getting water two years out of four, the gates being closed down by the water commissioner upon complaint of the Wheatland project, in consequence of which I lost about 3,000 bushels of oats in 1913. In 1912 we had water and got good crops. In 1911 the water commissioner closed down my gate for Hans Olson, when we were going to use the water for oats, and we didn't get much of a yield."

Andrew Popp had the same experience, testifying (p. 4194): "Have had good crops and some poor ones, too, especially when the water supply got cut off, which was done twice in three years. Three years ago (witness was testifying in 1914) the water commissioner put a notice on the headgate that it was closed under order of the water commissioner. We got out of water and didn't raise any alfalfa at all. The next year we got water and raised some alfalfa. Last year they shut off the water the first of July." All of the other witnesses confirmed these statements, and a similar situation was shown to exist upon the Little Laramie River. (Ingham, p. 1082; Ernest, p. 1120).

The Wheatland project has had the advantage of a reservoir with a capacity of more than 80,000 acre feet, with only a little over half of the 60,000 acre tract under cultivation; diversified farming is general, this on the one hand giving a more economical method of using water than the method necessarily used upon hay land, and on the other hand increasing the use of water in the latter part of the irrigation season when hay meadows do not require much. Despite the existence of the reservoir, an advantage which the Laramie Plains appropriators do not possess, the Wheatland farmers have felt a shortage of water. W. L. Ayers testified (p. 1225): "There have been years when we were a little short of water. That has also occurred since the completion of the large reservoir on the Laramie Plains known as Reservoir No. 2. There have only been one or two years that the farmers had all the water they wanted. We were short this year (the year 1913). Last year we got along fairly well, though there were a good many complaints about the water last year. The lands of my neighbors take more water

than mine. Some of mine is sub-irrigated. With that exception I use about the same amount of water as they do. They are using it to the best advantage they know how. We usually feel the shortage in the last irrigation of alfalfa, the last of August and first of September."

W. A. Baker, another Wheatland farmer, said (p. 1259): "There has not at all times been sufficient water. I do not remember the details except in the last two or three years. In these years in the first part of the irrigation season we had a pretty fair run until the latter part of July. Then we began to fall short and cut down, and sometimes we would be stopped for a few days."

As stated, the record shows without any contradiction that these early appropriators have actually used all of the water of the river. The physical facts with respect to the stream make such proof easy. By reference to the map attached to either the bill of complaint or the answer, it will be observed that the Wheatland No. 2 Reservoir is at the extreme northerly or lower end of the Laramie Plains, and below all of the ditches and canals upon the Laramie Plains. This is a channel reservoir, created by a dam thrown across the river so that it is in a position to store every drop of water that comes down the Laramie River, the Little Laramie River or any of their tributaries. It was located in 1894, and completed in July, 1901 (p. 48). The former manager of the project, M. R. Johnston, testified (p. 35) that it was the practice of the company to keep the reservoir gates closed except when water was drawn for irrigation purposes, and water was never released down the river in the early spring or late winter; that there was not enough water

below the reservoir when the gates were shut down, to protect the fish; and at page 112-113 he testified that since the construction of the reservoir, water had been permitted to flow down the river on only two occasions excepting when there was some accident. In 1907 water was released from the reservoir as a precautionary measure, high winds and uneven settling of the dam creating doubt as to its safety. In 1909, which was a year of high water the like of which the witness who had been in charge of this project since 1888 had never seen, a very large quantity was discharged from the reservoir; in fact, it is stated by the witness at another place (p. 30-32) that in 1909 the water continued to rise at such a rate that all discharge gates were opened; that he constructed an emergency spillway with plows, through which the water ran at a terrific rate for several weeks.

It is thus shown that there was really but a single year between 1901 and 1913, a period in which occurred both years above and years below the average in stream flow, in which all of the water of this river system was not actually used by these Wyoming appropriators.

Prior to 1909 the James Lake and Lake Hattie systems upon the Laramie Plains, and the Sybille and Bordeaux units of the Wheatland project, had not been completed and had diverted no water, and thus it appears that from 1901 to 1909, except for the small amount let down the river in 1907, the Wyoming appropriators who have a conceded priority over the Colorado appropriation used the entire flow of the stream, and in using it felt a pressure for water which any new diversion in Colorado must necessarily increase.

The history of the construction of the Wheatland No. 2 Reservoir presents in striking fashion the in-

sufficiency of the supply of water after the first of July in each year. Mr. Johnston briefly stated the facts as follows (p. 114): "I was present when Reservoir No. 2 was located at its present site in 1894. The settlers under our canals had held meetings and offered to increase the price to be paid us per acre under their contracts, if we would build the reservoir. At that time there were 2,000 acres under cultivation. There had been difficulty in securing water enough for the 2,000 acres. We were in position to divert and had been diverting all the natural flow of the river. Prior to constructing Reservoir No. 2 we ran short of water the first of July in some seasons, and from the middle of July on in some years." And at page 28 Mr. Johnston testifies that the owners of this small area then under irrigation, finding themselves short of water for even that amount of land, called a meeting and demanded of the company the construction of reservoirs, and submitted voluntarily to an increase of $2.50 per acre in their contract price for land and water. This resulted in the construction in the '90s of Reservoir No. 1, a small reservoir within the irrigated area itself, and the construction of Reservoir No. 2, of great capacity, completed in 1901. Certainly no more convincing proof that the undepleted flow of the river in July, August and September is wholly inadequate for the irrigation of the greatly increased acreage reclaimed prior to 1902, could be found.

IV. CERTAINTY OF INJURY FROM COLORADO DIVERSION, IRRESPECTIVE OF METHODS OF USE IN WYOMING, IS MADE CLEAR BY CONSIDERATION OF SEASONAL DISTRIBUTION OF FLOW OF RIVER.

The conclusion just reached is confused by the evidence offered by Colorado consisting almost wholly of generalizations, to the effect that there is a great waste of water in Wyoming through the methods of use. Without discussing the question of waste at this juncture, we believe it is clearly shown that the Colorado diversion will be a serious injury to the prior Wyoming appropriators irrespective of their method of using water, this being the conclusion from the evidence as to the seasonal distribution of the flow of the river.

The value of a water appropriation is determined wholly by the physical possibility and legal right to secure water under it when water is scarce; irrigation litigation arises when there is scarcity, not when there is plenty, and the right of a prior appropriator which courts are called upon to protect, is the right to take the water when the stream is low, and not the right to take the water when the stream is high. If all years were high, the country would be humid and not arid, and no irrigation whatever would be necessary. And so the effect of the Colorado diversion which is important to the Wyoming appropriators is its effect in years of low flow and in months of low flow, and the stream flow records introduced by Colorado itself show conclusively that whatever may be the adequacy of the

water supply during the high-water season of May and June for direct irrigation at these seasons, the present supply is wholly inadequate in July and August, and although the proposed diversion in May and June will in high years be of much less importance, that diversion in July, August and September is not only relatively much higher as compared to the amount of water in the stream at the point of diversion, but the portion of the drainage area from which such diversion is made is furnishing a very much higher part of the total stream flow than in the earlier part of the irrigation season. Accordingly, even should it be contended that the Wyoming appropriators make a lavish and wasteful use of water in May and June, during the period of greatest discharge, it still appears that when this high flow has passed and cannot be called back, the total flow of the stream is inadequate, even with the most economical method of use, to furnish water for these prior appropriators, and the Colorado diversion will further diminish this supply, already insufficient for the warm months of July and August, in which there is so little precipitation and the need is greatest. Much has been said by Colorado about the relative value of the grain crops in the valley of the Poudre as compared to the hay crop of the Laramie Plains, but never will Wyoming have an opportunity to carry on the gradual change from hay to grain now going on upon the Laramie Plains, if Colorado is permitted to take the best part of the water supply during the period of greatest need.

To present in the clearest form the practical situation with respect to the stream flow in the later irrigation season, and the greater relative importance of the higher drainage area in July, August and September,

we have prepared a table to show the comparative discharge of the Laramie River at Glendevey, Colorado, which is immediately below the Greeley-Poudre tunnel, and at Woods Landing, Wyoming, which is about ten miles north of the state line, and at the extreme upper end of the Laramie Plains, and below all of the mountain tributaries of the Laramie River, excepting one small one. The portion of the table relating to the discharge at Glendevey is derived from defendants' Exhibit 125 (p. 3418), which shows an average annual discharge of the river at this point for the six years included in the table, of 65,717 acre feet. This does not include the water diverted above the station by the Skyline and Wilson Supply (or Divide) ditches, which if added to the discharge at Glendevey would make the total 86,160 acre feet (p. 3420). It is also stated (p. 3422) that the six years covered by the table represent a flow of only 85 per cent. of the average for a long period, and upon that basis the Colorado engineer, Mr. Field, estimates the average annual flow at Glendevey to be 77,000 acre feet, this excluding, of course, the Skyline and Divide ditch diversions, (p. 3422), which if added would make the average annual discharge of the drainage area tributary to the Glendevey station approximately 100,000 acre feet. In the following tabulation, however, we have taken the discharge records as actually presented on Exhibit 125.

The discharge records of the Woods Landing station are taken from defendants' Exhibit 128 (p. 3440). This exhibit shows an average annual discharge of 254,111 acre feet, which for our present purposes would make an even more conclusive showing than a smaller amount furnishes. The winter records are, however, very greatly distorted, the discharge in January,

February and March, nearly all the way through exceeding the discharge in April, which is conclusive proof that the records for the winter months are entirely erroneous. The engineer presenting this table states (p. 3443) that while the table shows an aggregate discharge during the winter months of 68,349 acre feet, he has allowed but 32,000 acre feet, and accordingly we have deducted 36,349 acre feet from the total of 254,111 acre feet given in Exhibit 128 as the average annual discharge, leaving a balance of 217,762 acre feet. Aside from this change we have taken the figures for monthly discharge as given upon the exhibit; as stated hereafter in our general discussion of the stream flow records, we believe that these records as a whole are of but very little value, the methods of measurement being wholly unsatisfactory, but the records upon which Exhibit 125, covering the Glendevey station, and Exhibit 128, covering the Woods Landing station, are based, were obtained in the same way, and the objections that may be made to the one are applicable to the other, so that for our present purpose of showing the relation the discharge of each area bears to the entire drainage area of the river, the two tables may safely be used.

Comparative Table of Discharge of Laramie River at Glendevey (near Colorado tunnel) and Woods Landing, Wyoming. Abstract from Defendants' Exhibits 125 and 128.

	Glendevey	Woods Landing
Average annual discharge	65,717	217,762
May discharge.....	13,657	58,920
Percentage of annual	20.7	27.0
June discharge.....	27,644	76,107
Percentage of annual	42.0	35.0

	Glendevey	Woods Landing
July discharge	9,706	22,293
Percentage of annual	14.7	10.0
August discharge	3,043	7,460
Percentage of annual	4.6	3.4
September discharge	1,818	4,314
Percentage of annual	3.0	2.0
May-September discharge	55,867	169,094
Percentage of annual	85.0	77.7

The foregoing table shows that in July the discharge at Glendevey is 14.7 per cent. of the annual discharge, while at Woods Landing it is only 10 per cent. In August the Glendevey discharge was 4.6 per cent. of the annual, and the Woods Landing discharge was 3.4 per cent. In September the Glendevey discharge is 3 per cent. of the annual, and at Woods Landing, 2 per cent. In other words, the proportion of the annual discharge of the river occurring in July, August and September, is about 50 per cent. greater at Glendevey than at Woods Landing.

Another important fact proved by the foregoing table is that as we have before stated, the portion of the entire supply of the river coming from the higher mountain areas is greater in the last months of the irrigation season than in the earlier months. In June the discharge at Woods Landing was 76,107 acre feet, of which amount 27,644 acre feet, or 36.3 per cent., came from the area above Glendevey; in July there was 22,293 acre feet flowing by Woods Landing, of which 9,706 acre feet, or 43.5 per cent., passed Glendevey. In August the Woods Landing discharge was 7,460 acre feet, and the discharge at Glendevey 3,043 feet, feet, or 40.8 per cent., and in September 1,818 acre feet, or 42.1 per cent. of the discharge at Woods Landing flowed by the Glendevey station.

If to the discharge records as given in this table is added about 21,000 acre feet diverted into the Poudre Valley by the Skyline and Divide ditches, the proportionate value of the water secured from the high drainage area will be greatly increased. This amount should, of course, be added to both records, that at Woods Landing as well as that at Glendevey, but would increase the smaller flow at Glendevey proportionately more than it would increase the much larger flow at Woods Landing.

Colorado's engineer, Mr. Field, in his report upon the Riverside Ranch, immediately above Laramie City, stated, "The greatest demand will probably come in July, during which month probably three-fourths of an acre foot per acre will be required." (p. 3626). In our statement of the evidence relative to the amount of land irrigated in Wyoming, it has been shown that 52,186 acres is now under irrigation under ditches of conceded priority above the point where the Little Laramie enters the Laramie River, this being exclusive of the area irrigated from Sand Creek, the only stream excepting Fox Creek which is even nominally a tributary of the Laramie River between Woods Landing and the mouth of the Little Laramie. Accordingly, the water in the stream at Woods Landing constitutes substantially the entire source of supply for the land irrigated above the mouth of the Little Laramie River, 52,186 acres according to our evidence, and 38,241 acres according to the evidence for Colorado, (p. 2781). Accepting the statement of the state engineer of Colorado that this land would require three-fourths of an acre foot per acre during July, and assuming that the average annual discharge at Woods Landing in July is 22,293 acre feet (although we shall show that

this estimate is very much too high), then the amount of land which can be properly and economically served by this stream flow in July is 29,724 acres, or but little more than one-half of the area shown by the Wyoming evidence to be dependent upon this source. From this insufficient quantity Colorado intends to divert approximately the amount of water passing the Glendevey gauging station, which in the years covered by the foregoing table averaged 9,706 acre feet, or 43.5 per cent. of the available supply for the Wyoming lands. This amount, however, is based upon records for years said to be only 85 per cent. of the average stream flow, and if we accept this Colorado contention, then the amount that will be diverted through the Greeley-Poudre tunnel in July in years of average run-off, will be 11,419 acre feet, or more than one-half of the amount of water available for the irrigation of Wyoming lands above the mouth of the Little Laramie River.

It is conclusively shown, therefore, that in years of so-called "normal flow" the entire water supply of this interstate stream is inadequate for the proper and economical use of prior appropriators in Wyoming, and that it is the purpose of Colorado to divert one-half of this insufficient supply into the valley of the Poudre River. But the proof of certain damage to the Wyoming appropriators goes much further than this, for we have been dealing with the abstract case of a year of average flow. Such years do not occur with any frequency, and there are just as many or more years with less than average runoff than there are years above the average, and in such years the necessities of the Wyoming appropriators will be just as great (and ordinarily, because precipitation is less, even greater), and the entire undepleted supply will be

even less adequate for filling that demand. In such years any diversion by Colorado will lead to even greater loss.

V. COLORADO'S WHOLE DEFENSE DEPENDS UPON HER RIGHT TO COMPEL PRIOR WYOMING APPROPRIATORS TO CONSTRUCT RESERVOIRS.

Since there is an unquestioned shortage in water supply during the last months of the irrigation season in almost every year, and during the entire season in years of low flow, Colorado's contention that the water supply is adequate for all Wyoming appropriations and for the proposed Colorado diversion, is necessarily based entirely upon a consideration of the flow of the river over a long period of years, and the defendants insist that the records covering such a period show that the average annual flow of the stream is wholly adequate; but as we have shown that from the time of the completion of the Wheatland No. 2 Reservoir in 1901 until 1909, a period of eight years, the entire flow of the stream had been conserved and used, it has been necessary for Colorado to attack the methods of use in Wyoming as wasteful and extravagant, to establish a theoretical stream supply of a vast quantity, and to scale down as much as possible the area of land upon which this theoretical water is used.

But no wheat is raised by the use of water that flowed by two years ago, and the high flow of 1912 could be of no possible value to the farmer in 1913 unless by the construction of reservoirs that flow was conserved for use in the subsequent year. Accordingly,

Colorado's whole case depends upon its right to demand of the prior appropriators in Wyoming that they construct reservoirs to conserve water from the high years for use in years of scarcity, and from the high months for use in the later season, in order that Colorado may take the water which they have heretofore been using by direct diversion. The great mass of evidence with respect to average annual flow, methods of use, and waste, is material only in this connection.

It must be noted that Colorado is not proposing to construct a reservoir in the Laramie valley and store therein in years of high water that part of the flow which it claims is not needed for the prior direct appropriators in Wyoming, and the evidence with respect to stream flow, average annual flow, and waste, has not been offered to justify such a storage or diversion in years of surplus; what Colorado is here seeking is to show that in years of high water there is a surplus which if stored by Wyoming will satisfy the Wyoming appropriators, and upon that basis Colorado contends that she shall have the right to divert the water the lower appropriators have heretofore used, and thrust upon those appropriators the expense of reservoir construction and the chance of having enough water even then.

VI. RESERVOIRS WILL NOT SOLVE WYOMING PROBLEM.

If Colorado has a right which no subsequent appropriator has ever been held to possess, and may require the prior appropriators in Wyoming to construct reservoirs in which to store water in high years to take the place of that which Colorado will divert in low

years, the Wyoming problem will not even then be solved by such reservoir construction, for the following reasons:

1. The construction of reservoirs is impracticable on account of the high cost as compared to the benefit from the use of the water, and because the fluctuation in annual runoff is too irregular to permit fully successful storage.

2. The total supply if conserved is not sufficient to fill Wyoming priorities if depleted by Colorado diversion.

The construction of reservoirs for irrigation purposes has always been entered upon for financial benefit, which is true of all irrigation practices. The value of the product from fruit trees in California justifies expenditures for the conservation and distribution of water which would clearly not be justified by the value of the hay raised upon the ranches on the Laramie Plains, and whether the State of Wyoming, which has had no control over nature, and if it progresses must utilize such resources as have been given it, poor as they may be, is to have the benefit of the natural development of the vast area lying within the valley of the Laramie and by nature tributary to that stream, will depend, if Colorado should take the water it desires, upon the extent of the financial return that may be obtained from the irrigation of this land as compared to the expense of constructing reservoirs. Colorado has burdened this record with tributes to the Poudre valley, and not content with proving the productivity of that area, has sought to make the picture more striking by setting forth the dismal character of the Laramie Plains, and now seeks to force the expense of

reservoir construction more extensive than that which has been undertaken in the Poudre Valley itself, upon an area which is described by the state engineer of Colorado in his testimony as follows: (p. 1413) "When he (any investigator) observes the new irrigation projects, he wonders whether the projectors have been competently advised, and whether it is not spoiling a good ranch country to make a poor farming country, which is destined ultimately to failure. This impression I received when I first went in there, and it has been borne in upon me ever since, every time I go up there."

Naturally we do not concur with Mr. Field's opinion (so different from his conclusion four years earlier, set forth in his report, (pp. 3624-3637) as a paid engineer upon the Riverside Ranch near Laramie) that the product from the irrigated land upon the Laramie Plains is so meagre as to make the expenditure of money in irrigation ditches waste, for through such expenditure there has in the course of time been built up a prosperous community, contributing largely to the prosperity of its State and nation; but it is true that the principal product to this time has been hay, of a value which will not justify expenditures for reservoirs.

But the construction of reservoirs is impracticable as a complete substitute for direct flow, for another reason—the fluctuation in annual discharge of the river. The defendants in the course of the presentation of the evidence developed a theory of obligation to conserve water which finally threatened the Poudre itself, inasmuch as the construction of reservoirs in that district has fallen very far short of such high duty, and it was then possible to secure from the Colorado expert,

Prof. Carpenter, a fair statement of the practical considerations influencing reservoir construction, as follows: (p. 3946)

> "With regard to financial practicability of construction of reservoirs on Poudre River capable of conserving extraordinary floods, will state that they call for an expenditure that could be utilized only occasionally. It would be similar to financial proposition of people in Florida preparing to heat their houses in the same manner as those in the northern part of the United States. For years of unusually high flow in the Poudre River, conservation works, to utilize the excess waters in that stream, would have to count on carrying water over more than one year. The utilization of this water means the presence of population on the land; that population must have a living from year to year and they are not justified in going out on to the land and settling to raise a crop only once in three or four years. They must have sufficient to make a living from one year to another, and consequently the investment must be such that there can be sufficient water every year to keep these people on the land, and when water can only be conserved once in every three to five years, there must be provision for carrying over water or the people cannot live. It is a question of population as well as investment. The population has to exist and stay on the ground. From the standpoint of investment, conservation of flow such as extreme flow of 1884 would be impractical to the extent that it exceeded the ordinary high year. Of such character would be the floods of 1885, 1900 and 1909, three years in thirty."

As a matter of fact reservoirs cannot be constructed upon the theory that by so doing it is possible to make yearly use of the theoretical average flow of a river.

This would be impossible even if the flow of a stream fluctuated with complete regularity, being 125 per cent. of the average in odd numbered years, and 75 per cent. of the average in even numbered years, for the 25 per cent. that is carried over in each alternate year would in the course of a year's storage suffer a very large loss from seepage and evaporation, the evaporation alone, according to a Colorado witness (p. 3754), being as much as six feet per year from the surface of standing water. But stream flow varies in no such manner. For a few years, high and low seasons may alternate; sometimes there are several years of high water grouped together, and sometimes several years of low flow succeed each other. The only rule that seems to be derived from long time records is that there will be one or two years of exceedingly high runoff which will tend to raise unduly the average for the period so that the number of years in which the flow falls considerably short of the average will be greater than the number of years in which the flow is greatly in excess of the average. These irregularities of stream flow are well shown by the defendants' Exhibit 124 (marginal page 3398), which gives the discharge of the Poudre at the mouth of its canyon from April to October, inclusive, from 1884 to 1913, showing an average net annual discharge during the period, of 297,322 acre feet. To facilitate the discussion of practical irrigation problems arising from irregularity in stream flow, we here set forth a tabulation derived from Exhibit 124, setting forth the runoff in each year, the percentage this bears to the average for the thirty-year period, and the amount in acre feet by which the runoff exceeds or falls short of the average:

Variation in Discharge of Cache la Poudre River Derived from Defendants' Exhibit 124

Year	Runoff in Acre Feet	Per cent. of Average	Variance from Average
1884	666,466	227	+369,144
1885	465,475	157	+168,153
1886	290,392	98	– 6,930
1887	286,840	96	– 10,482
1888	155,970	52	–141,352
1889	185,060	62	–112,262
1890	221,023	74	– 76,299
1891	257,236	87	– 40,086
1892	193,790	65	–103,532
1893	216,730	73	– 80,592
1894	309,444	104	+ 12,122
1895	344,500	116	+ 47,178
1896	162,340	55	– 34,982
1897	332,070	112	+ 34,748
1898	172,290	58	–125,032
1899	388,591	131	+ 91,269
1900	474,573	160	+177,251
1901	339,155	114	+ 41,833
1902	151,636	51	–145,686
1903	345,150	116	+ 47,828
1904	315,437	106	+ 18,115
1905	361,652	122	+ 64,330
1906	279,974	94	– 17,348
1907	386,244	130	+ 88,902
1908	252,843	85	– 44,479
1909	486,002	163	+188,680
1910	157,514	53	–139,808
1911	205,611	69	– 91,711
1912	297,722	100	+ 400
1913	217,959	73	– 79,363

Average runoff 297,322.

The foregoing table shows that in the thirty years, one lone year had an average runoff, which of itself sufficiently demonstrates the misuse of the word "nor-

mal", as applied to the average or mean flow over a period of years. In thirteen years the runoff exceeded the average, and in sixteen years the runoff was below the average. In four years the discharge exceeded the average by more than 100,000 acre feet, and in seven years it fell short of the average by more than 100,000 acre feet. In seven years the runoff exceeded the average by more than 50,000 acre feet, while in eleven years it fell short by more than that amount. In 1884 the discharge exceeded the average by more than 369,000 acre feet, being 180,000 acre feet in excess of the next highest year on record. Even with the present reservoir development of the Poudre valley, none of this water could have been stored for the benefit of subsequent years, because in 1885 the runoff exceeded the thirty year average by 168,000 acre feet, which would have exceeded the total reservoir capacity of the Poudre valley as now existing. For all practical purposes, therefore, the surplus discharge of 1884 has been and could be of no possible value to the water users, and yet the presence of this year in the table raises the average for the thirty years by more than 12,000 acre feet, once more demonstrating the purely theoretical quality of the so-called "normal flow" of the river. But the important feature of this table lies in the fact that it shows how much the most complete reservoir construction will fall short of making available in each year the average discharge of a river. It is repeatedly claimed, and we believe with justice, that irrigation practice has reached its highest point in the mountain region in the Poudre valley, and we may therefore look to the present reservoir facilities in that valley as representing the farthest point that may profitably be attained, even in a wonderfully pro-

ductive country. Colorado's state engineer, Mr. Field, testified (p. 3721) that in 1912 the total capacity of reservoirs in the Poudre valley was 146,665 acre feet, and that there was stored in these reservoirs on November 1, 1912, 83,794 acre feet, leaving 62,871 acre feet of available capacity. In that year the stream flow was almost exactly the same as the average for the thirty year period, being 297,722 acre feet from April to October inclusive, and so it is seen that since only 62,871 acre feet of water could have been stored in addition to that actually stored at the close of the irrigation season in that year, the total flow of the stream of which use could be made would be 360,593 acre feet, and any flow in excess of that amount would be lost for lack of reservoir capacity. It appears from the foregoing table that in seven of the thirty years the flow was in excess of 360,593 acre feet, and that the total excess above that figure in those seven years was 704,832 acre feet. Accordingly, even though there had been, throughout the thirty years, the same high stage of reservoir development which had been attained in 1912, there would have been a direct loss of 704,832 acre feet, and a corresponding deduction of 23,500 acre feet should be made from the average flow of the stream, if we are to determine the average amount which in actual practice can be used in the Poudre valley. And even from this must a deduction be made where two or more high years come together, because the reservoirs once being filled cannot conserve any part of the surplus of a second high year; and finally, the great loss from seepage and evaporation must be deducted. This, we believe, sufficiently shows the error that must exist in any conclusion as to the amount of water available through the construction of reservoirs,

based merely upon the average annual runoff as derived from stream flow records.

The inadequacy of reservoir conservation as a substitute for a direct supply is finally demonstrated by observation of the manner in which low years frequently follow each other. A very marked example is furnished by the record of the Poudre as above set forth, for the years prior to 1894. 1884 was the largest year on record. It was followed by another exceedingly large year, and then followed two years of almost average flow, and then six years of very low discharge. No conceivable reservoir system could have conserved the whole surplus flow of 1884. No present reservoir system could have conserved the surplus discharge of 1885. Whatever the amount stored from those two high years might have been under any conceivable circumstances, that amount would have had to be carried over the years 1886 and 1887, which were of average discharge, with the resulting losses, and would have been exhausted by the demand in the very low year of 1888; certainly by the demand in that year and by the demand in the almost equally low year of 1889. No possible amount of storage could have saved any water at all for the use of appropriators in the low years 1890 to 1893 inclusive. This same situation is repeated in the last few years. 1909 had a very large surplus flow, being about 188,680 acre feet in excess of the thirty year average. As a matter of fact none of this surplus was conserved in the Poudre valley; on the contrary it appears that in this favored country of perfect irrigation practices and complete conservation of water not even the so-called "normal flow" was used in that year, for defendants' Exhibit 113 (p. 2487), shows that in 1909, 288,588 acre feet of

water flowed from the Poudre into the Platte River, indicating the use and storage in the year of less than 200,000 acre feet, or only two-thirds of the "normal flow" of the stream. But assuming that it had been financially practicable to construct irrigation systems designed to make use annually of a flow approximating the average flow of the stream, and to construct reservoirs to conserve the surplus of high years for use in low years, even then the amount carried over from 1909, when the inevitable losses from evaporation and seepage are considered, would not have done more than supply the deficiency of 1910, which fell short of the average by 140,000 acre feet; and then followed the year 1911 with a discharge more than 90,000 feet below the average, which would have no supply from former years; the year 1912, with an average flow from which, on the hypothesis assumed, no water could be stored for future use; and the year 1913, with a shortage of 80,000 acre feet, with no stored water to fall back upon. Now if we assume that from this discharge there had been diverted into another watershed the comparatively constant runoff from the head of the stream, amounting to 75,000 acre feet, the disaster to the farmers in the years 1911, 1912 and 1913, would be certain.

Our contention is not that the construction of reservoirs as a general rule is not profitable, and we concede that many irrigation enterprises are successfully carried through where there exists a shortage in some years, but in this case the Wyoming appropriators have a supply which is certain and comparatively constant in every year, namely, the runoff of the high mountain territory at the head of the Laramie River. Colorado threatens to take this certain supply, and contends that its place may be taken by water stored

in years of high flow, in reservoirs which it insists Wyoming should construct, and we now say that even if Colorado may impose this burden upon the prior appropriator, Wyoming, even then the supply so secured will not be constant and certain in each year, and will not therefore be compensatory for the amount taken by Colorado. This is the conclusion if we treat Wyoming appropriators as a single body; it is much strengthened when it is considered that they are numerous, own individual ditches, and must each for himself construct his own reservoir or else pay a large price to some company for reservoir water to take the place of the water which he appropriated without charge from the direct flow of the stream.

Finally, Wyoming contends that the entire flow of the Laramie River, even though fully conserved and economically used, is not adequate to supply prior Wyoming appropriators if the proposed Colorado diversion is made.

We have deferred discussion of the difficult question of water supply as a whole to this point in order to avoid confusion, for we have shown that the Wyoming appropriations are based upon the direct flow of the stream, that this direct flow, if undepleted by Colorado, is a wholly inadequate supply during the most important part of the irrigation season, and that the question of total river discharge in periods when not required for direct diversion is material only if Colorado has the right to take the direct flow and compel us to build reservoirs.

If Colorado has this right, then it becomes important to determine the adequacy of the entire flow of the river, and on that point we contend that the supply is not sufficient to permit the Colorado diversion,

even though it be possible to store all excess flow and hold the water so stored without loss until a low year comes, an irrigation development which, as we have just shown, cannot be attained and which is far beyond the development in the productive Poudre valley.

There are two methods by which the question of the adequacy of the water supply may be determined: First, by ascertaining the volume of water, the area of land irrigated, and the theoretical requirements of that body of land; second, by showing that in actual practice the available supply has been used upon a given area of land without waste.

Colorado has depended principally upon the first method, Wyoming upon the second.

Let us consider the first, requiring as it does the determination of three items:

a. The average annual flow of the stream.

b. The area of land irrigated.

c. The theoretical duty of water.

a. Average Annual Flow of River.

This topic is discussed at considerable length in our original brief, pp. 31-47, to which we would respectfully refer the court; to avoid too much repetition we shall here enter upon no general discussion as appears there, but shall confine ourselves to a more specific reference to the particularly important evidence.

One witness for Colorado, Prof. Carpenter, testified concerning a few individual discharge measurements made by him in 1912, but did not testify generally concerning river flow. Such evidence was given by only two witnesses, one the state engineer of Colorado,

Mr. Field, and the other our hydrographer, Ralph I. Meeker. Mr. Field, so far as the record shows, not only never made a discharge measurement himself (p. 4272), but he did not even have personal direction of any of the hydrographic work the results of which he used in his computations; commencing with April, 1913, he was the state engineer of Colorado, and in that capacity had control of such hydrographic work as was carried on by his assistants, but even in that year he did not personally supervise any of the work upon the Laramie River. On the other hand, the testimony of Mr. Meeker is based upon discharge measurements taken by him personally and by observers acting under his continuous personal supervision, for the period of two years commencing in May, 1912. He supplemented his testimony with respect to the exact discharge between May, 1912, and May, 1914, by conclusions as to the average discharge over a longer period, and in reaching such conclusions made an analysis of all available data (p. 4327), but the important portion of his testimony is that relating to the discharge in the two years covered by his actual measurements, and this is the only evidence of such character appearing in the record. Mr. Meeker's qualifications and diligence as a hydrographer are not challenged. His hydrographic experience covered a period of thirteen years with the Geological Survey, the federal reclamation service, and private corporations, and commencing in May, 1912, until his final testimony in May, 1914, he devoted his entire time to hydrographic work upon the Laramie River and its tributaries (p. 217).

The relative value of the suppositions, surmises, inferences and deductions of Mr. Field and the definite testimony of Mr. Meeker, is best shown by a considera-

tion of Mr. Field's testimony and the continuous difficulty he experienced by reason of the character of the hydrographic data with which he was compelled to work. The instances are so many that but a few may be given.

One set of discharge records which Mr. Field could not accept was the Geological Survey report of the discharge of the Laramie River at Decker's ranch, a gauging station in Colorado immediately above the state line. He says (p. 3435) that there are two sets of records for this station, one kept by the water commissioner and one published by the Geological Survey, and that the latter is very much lower than the former; that the Geological Survey hydrographer had prepared on the ground a rating table which he gave to the water commissioner, and by using this rating table and applying it to the gauging heights as determined by the water commissioner, the witness ascertained that the discharge was much greater than that given in the published record (p. 3435). He also explains (p. 3436) that the published record is based upon a rating table worked out several years later by some hydrographer in Washington with no personal knowledge of the conditions, and that the note attached to the published record that the gaugings were probably too high because of a defective meter, indicates to him that the gaugings were actually too low, because a defective meter would have that tendency. He reaches the same conclusion, that the published records are very much too low, by comparing them with the records of discharge at Glendevey, several miles farther up the stream, and says that the indicated inflow between the two stations is too small, thereby proving that the Decker record is too low, not that the Glendevey

record is too high, (p. 3435), and finally he rejects the conclusion, drawn from the records at Decker and at Boswell, which is immediately below Decker's ranch and just north of the state line, that the amount contributed by Colorado to the Laramie River is 197,000 acre feet (p. 3436).

In dealing with the data with respect to discharge at Woods Landing, a station in Wyoming a few miles north of the state line and below practically all tributaries, Mr. Field excludes the records relating to discharge in January, February and March, because they are questionable (p. 3441); discards the records for the years 1889 and 1893, inclusive (p. 3440), and uses the records between April and October subsequent to 1894 as the foundation upon which he ultimately bases his conclusion with respect to the average discharge of this stream, and says of these records that they are "more reliable and less open to question" (p. 3441).

Generally of the Woods Landing records, Mr. Field says:

> "At Woods Landing Station we have records more or less complete and more or less authentic and reliable for years 1889 to 1900 inclusive, with exception of year 1894. We also have records for 1911, 1912 and 1913, the only records. Most of them at least are not entirely above suspicion, probably on account of ice conditions and fragmentary conditions of records and lack of sufficient number of actual gauge readings during winter. 1912 record as shown on Exhibit 128, was amount given by R. I. Meeker in his tables showing discharge at Pioneer Dam. These records are from April to December inclusive for 1912. This amount for 1912 given by Mr. Meeker is open to serious question, especially for months of June

and July, for reason that amounts given for those months for Pioneer Dam station are less than discharge for same months of that year at Boswell Station, notwithstanding that there is very considerable runoff during those two months from territory lying in between the two stations." (p. 3447.)"

The record taken by Mr. Meeker which Mr. Field here criticises, was made at the Pioneer Dam, four miles below Woods Landing at a point where the river has entered the Laramie Plains, and the measurements were made of water passing over a concrete weir in a dam across the river, so that cross section measurements and gauge heights were absolutely accurate, something that is impossible in measurements made in open rock-strewn channels (p. 218). The record taken under these conditions, and presented under oath by a qualified hydrographer who made the measurements, is not acceptable to Mr. Field, who criticises it on the bases of records kept by persons who did not testify, some of them with no hydrographic experience whatever, at Boswell, a station in the mountains where the channel to be measured is irregular.

Again (p. 3465) Mr. Field points out a serious error in the published record for the discharge at Woods Landing in 1895, a mistake which he discovered by getting hold of the original gauge records and replotting a discharge curve, thereby increasing the annual discharge more than 44,000 acre feet.

An even more striking illustration of the uncertainties of discharge records based upon data furnished by ranchmen who undertook to take gauge readings and change automatic register charts, and who attend to this to them unimportant business just as they happen

to think of it, is supplied by Colorado's long tale about the hydrographic tragedy occurring at Boswell station in 1912. The Colorado expert, Prof. Carpenter, testified (pp. 3792-97) that on May 29, 1912, he discovered that the automatic register was not recording the height as indicated on the staff gauge, and that frequently throughout the summer the register was checked with the gauge and found to vary from time to time from three-tenths of a foot to one foot. This, of course, required a recomputation of the gauge readings furnished by the automatic register, it being necessary for the person revising the record to estimate just what the variation from the actual depth was from day to day. But this was not all. Prof. Carpenter likewise discovered at the same time that the river overflowed its channel when its depth reached 3.4 feet, and a considerable volume of water flowed around the bridge at which the measurements were made and through several culverts, and from time to time during the high water season he measured the flow through these culverts (p. 3798-3804). Here again it was found necessary to increase the discharge record above that as published by the state engineer of Colorado. And because the record maintained continuously by Mr. Meeker at the well equipped station at Pioneer Dam does not agree with the record at Boswell station, taken under these conditions and revised time and again, the Pioneer Dam record is not accepted by the Colorado expert. These instances pointed out by Colorado witnesses, of gross errors in discharge measurements, well illustrate the truth of the following general statement of Mr. Meeker (pp. 4273-4275):

"I am familiar with the general practice and

methods used in measuring streams and recording flow, and have had about fourteen years' experience in measuring streams and in computing data and in analyzing data secured by others, and I am familiar with the methods of measurement and sources of records in the State Engineer office of Wyoming and Colorado and the U. S. Geological Survey, having spent several years with the survey in Colorado and adjoining states, measuring streams and canals and in that work and related work, since which time I have had occasion to go into the records both in Wyoming and Colorado. The accuracy of stream records depends first on the natural conditions at the gauging station, and secondly, the methods and care used in securing those data. The greatest and most common errors that occur in stream measurement are usually caused by incorrect soundings, which invariably give too great a cross section, especially in high water measurements. The reasons are that in making soundings the weight in streams which have rock beds sinks into holes between the rocks or the weight and lines are carried down stream to a point not perpendicular to the cross section, giving soundings which are too great. Errors also occur from lack of keeping the meter point clean and sharp to avoid increased friction. If not well oiled and in good condition the velocities secured are below their true values and the measurement is less than the actual volume of water. At times on mountain streams the velocities of swift currents can only be secured on the surface when a co-efficient is required for the reduction to a mean velocity. Such co-efficients are based on experience and judgment is needed in their application. The tendency of all high water measurements both from sounding and velocity factor is to secure too high results, as disclosed by an examination of the older and earlier records, which being from high water measure-

ments, are usually in error and give results far too great. Errors also occur from the settlement of the gauge, and unless frequent checkings of bench marks are resorted to these errors may cover a considerable length of time, giving a gauge reading which is too high and therefore showing more water than actually passes. Errors frequently occur from careless readings of the gauge or from neglect and faking of the records. The time of day at which gauge height observations are taken may not give a true mean for that day, especially on mountain streams, where the daily tide is pronounced. In case automatic stage registers are used, it is very important that the pen be checked with the staff gauge each time the chart is changed, and proper notations be noted on the sheet, in order that corrections may be made. Errors also occur in measurements at time of high water from rising and falling stages. Back water from dams, drift or other things frequently vitiate the results for short periods. Ice conditions are an important factor and the direct application of discharge measurements based on open channel conditions and applied to gauge heights secured when ice conditions obtain, give result too large. This is also true of obstructions of channels by driftwood or otherwise. Numerous instances have come to my notice of stream measurements in the west where the winter records are practically of no value, being grossly in excess of the actual runoff. This has been confirmed by the more efficient methods of today and greater care used that a sufficient notation as to conditions during the time observations were secured. The errors in the field in making stream measurements are not the only ones. Errors frequently occur in computation, and especially so in the extension of the discharge curve beyond known points of measurement to cover high water. In such case the error is usually positive. In summation then,

the accurate measurement of stream flow with current meters is not a mechanical operation which can be performed by indiscriminate and inexperienced persons but requires experience and judgment, not only in the field, but for the proper application and computation of the data secured. Errors in stream measurement preponderate in the positive direction."

But Mr. Field's testimony and conclusions were not based wholly upon this great mass of nondescript records, the correctness of which he himself so frequently challenged. He adds to the results obtained by the use of these records in two ways: first, by assuming that the records even if correct do not represent the flow in years of average discharge, and second, by finding additional supplies of which he has no measurements.

Mr. Field presented a table which has heretofore been discussed, of the discharge of the Poudre River for thirty years, and throughout his discussion of the Laramie River he assumes that because the very highest portions of the drainage area of the two streams join, that the high and low years upon the Poudre will coincide with the high and low years upon the Laramie. For example, in his discussion of Exhibit 127, a table showing the discharge of the Laramie River at Woods Landing from April to October in each year, being the table upon which he ultimately bases his conclusions with respect to water supply, Mr. Field says (p. 3442) that the average discharge for the nine years which includes all of the data with which Mr. Field is satisfied, is 198,545 acre feet for the months of April to October inclusive. In this period there occurs, he testifies, ninety per cent. of the annual flow, and he accordingly

concludes that the annual average discharge would be 220,490 acre feet; we have no objection to this method of estimating what portion of annual flow occurs in particular months, but in these same nine years the flow of the Poudre River was only ninety-six per cent. of the thirty year average, and Mr. Field unhesitatingly assumes that this is likewise true of the Laramie River, and thereby boosts the average annual flow of the stream to 230,000 acre feet, this being exclusive of the amount diverted into the Poudre River by the old Skyline and Divide ditches, and (p. 3470) Mr. Field even uses this same method upon the Little Laramie River, whose headwaters do not approach within fifty miles of the Poudre and are in a different range of mountains, and applies the Poudre average for as small a number as two years.

We do not believe that this method of determining stream flow has any value, and in order to show that this is true, we offered in evidence a table, complainant's Exhibit T-9, showing the discharge of the North Platte River near Saratoga, Wyoming. (p. 4298). Mr. Meeker, who prepared the table, testified (p. 4297) that the North Platte and Laramie rivers flow about parallel to each other eighty miles apart, the upper portions being only twenty miles apart, however; that the drainage basins are similar, and that in his opinion there is a closer resemblance between them than between the drainage basins of the Laramie and the Poudre, and that the annual fluctuations in the flow of the Laramie and North Platte would be more nearly the same than in the case of the Laramie and Poudre rivers. By this table it appears that the discharge of the North Platte River in 1912 was 115.5 per cent. of the average flow for eight years including the very

high year of 1909, and in 1913 was 73.7 per cent. of the average, whereas it is contended by Colorado that the discharge of the Laramie River in 1912 was 101 per cent. of the average, and in 1913 was about 51 per cent. of the average, because the flow of the Poudre in those years bore the same relation to the average of that stream. Different experts may, it is thus shown, draw such widely different conclusions as to the average flow of the Laramie River, dependent upon whether the flow is considered as more closely related to that in the Poudre or that in the North Platte, that any conclusion based upon any other records than those of the stream itself, must be wholly unsatisfactory. It may be reasonable to say that a very high year upon one stream will coincide with high years upon other adjacent streams and that all streams on the same side of the continental divide will have low flows in the same year, but it is absurd to contend that in these river systems lying many miles apart the annual fluctuations will be within two, ten, or even twenty per cent. of each other.

And finally, Mr. Field has very largely based his conclusions upon an entire lack of data in many instances. He includes in his summary (pp. 3476-3477) 17,000 acre feet as the flow of Sand Creek, and this is the basis upon which he determines that flow: "Sand Creek drainage in Colorado is about 50,000 acres, from which runoff should be one-third of an acre foot per acre, or in round numbers 17,000 acre feet." (p. 3445). As a matter of fact Sand Creek is only nominally a tributary of the Laramie River. We have shown heretofore that nearly 6,000 acres are irrigated from this stream in Wyoming, and it is shown without contradiction (p. 890) that in only five years since 1877 has

any water flowed from Sand Creek into the Laramie River. But it does lie within the Laramie River basin, and upon the theory adopted by Colorado its flow may properly be considered in determining the entire water supply of the whole vast drainage area, but certainly this kind of evidence as to what the annual flow of the stream is, is of no value.

Mr. Field finds an average discharge of 9,000 acre feet from Stuck Creek, one of the small Colorado tributaries (p. 3428-29), his conclusion being based on two measurements in May, five in June and two in July in 1912, and a larger number of measurements in May, June and July in 1913, and the rest of the year is wholly guess work. Mr. Field also properly uses the term "estimated discharge" in considering the value of Johnson and Beaver Creeks, upon similarly inadequate data (p. 3432).

Fox Creek, entering the stream between Woods Landing and Pioneer Dam, is said by Mr. Field (p. 3473) to have an annual discharge of 14,400 acre feet, based upon no data whatever excepting the area of the drainage basin. He then finds 12,800 acre feet in the mountain territory north of the Little Laramie and west of the Laramie River (p. 3474), once more based on nothing but territorial dimensions. Another 12,800 acre feet appears from the territory on the east of the Laramie River on the basis of one-ninth acre foot per acre runoff for the whole area (p. 3474), and he is equally confident that there must be considerable runoff from the plains area itself, but conservatively omits it from his computations (p. 3474). Sybille Creek is given 20,000 acre feet, based upon the record for the single month of April, 1912, (p. 3475), and his conclusion is that the total water supply of the entire

Laramie River drainage area is 447,692 acre feet (p. 3476), of which 250,500 acre feet is the average annual discharge of the Big Laramie River at Woods Landing, including the amount diverted by the Skyline and Divide ditches, 20,700 acre feet is the average annual discharge of the Little Laramie River, and the balance the contributions from the miscellaneous sources just discussed (p. 3473).

We have shown that this evidence is not the testimony of any hydrographer who has made measurements in person but of an engineer whose only data have been unidentified records which he has continuously criticised as inaccurate, who after discarding inconvenient records and shaping the remainder to suit his purpose, has added materially to their face value by assuming that no combination of years in which records were taken did other than represent less than the average flow of the river, and who finally added a few miscellaneous items of water supply without any record at all, making the river larger and larger on its way through the plains and overlooking his statement on the first day he testified that streams in the arid regions differ from those in humid countries in that they decrease materially in flow as they cross the plains (p. 1386). Opposed to this evidence, Wyoming offers the testimony of the only hydrographer who made or personally supervised the continuous records upon which his conclusions are based. Since Mr. Meeker was testifying only with respect to his own records and was not compelled to resort to fanciful methods, his testimony is comparatively brief and the substance thereof is contained in two tables, complainant's Exhibits T-7 and T-8 (p. 4294). On the Laramie River at the Pioneer Dam, which is below all tributaries

excepting Sand Creek and the Little Laramie River, he found that the average annual flow over the period from April, 1912, to May, 1914, was 161,054 acre feet, and the average annual flow of the Little Laramie River as determined from the actual records covering the period from June, 1912, to May, 1914, was 68,820 acre feet. From an analysis of all available data including all used or furnished by the state engineer of Colorado, Mr. Meeker was of the opinion (p. 4296) that the average annual flow of the Laramie River at the Pioneer Dam was approximately 200,000 acre feet. He did not state his conclusion with respect to the average annual flow of the Little Laramie River, but his Exhibit T-8 shows that the total discharge in 1913, adding the amount diverted above the gauging station, was 59,637 acre feet, or a little more than one-half of the flow of the upper stream in that year.

Mr. Meeker, who certainly in two years had become thoroughly familiar with the streams upon the Laramie Plains, was able to testify from personal observation that the miscellaneous items contributed to the total water supply by Mr. Field do not exist. As has been stated, Fox Creek enters the Laramie River between Woods Landing and the Pioneer Dam, and accordingly whatever its flow may be it is included in the discharge records of the Pioneer Dam station. Mr. Meeker testifies that there is practically no inflow from the area north of the Little Laramie and west of the Laramie River, from which Mr. Field thought 12,800 acre feet would be derived (p. 4304-5), and that the same is true with respect to the mythical supply of 12,800 acre feet from the east side of the river (p. 4306). The discharge of Sybille Creek, whatever it may be, is a source of danger rather than of

supply to the Wheatland district, the only one that could be served from it, the discharge being due largely to cloudbursts, which when added to the water being drawn from the Wheatland No. 2 Reservoir frequently washes out the headgates of the distributing canals (p. 164-167).

As a matter of fact all of these small creeks are utilized for the irrigation of small meadows along them, the area of which is not included in the tabulation of lands irrigated from the Laramie River but the extent of which is indicated by the adjudication decrees hereinbefore abstracted.

Our conclusion is that the average annual flow of the Laramie River is not to exceed 200,000 acre feet, and the average annual flow of the Little Laramie River is about 110,000 acre feet, and that these two sources constitute the entire supply of water available for the irrigation of the lands served by the two streams.

b. The Area of Land Irrigated

We have heretofore discussed the evidence as to the amount of land irrigated in Wyoming, and have shown that the area irrigated from the Laramie River under ditches of conceded priority is 97,855 acres, and the amount irrigated from the Little Laramie River, all under very old priorities, is 48,344 acres, a total of 146,199 acres. This does not include the land irrigated from Sand Creek or the other little creeks upon the Laramie Plains, nor the lands irrigated from Sybille Creek, the North Laramie River and Chugwater Creek, on the east side of the Black Hills. For the irrigation of this 146,199 acres we have a water supply averaging

310,000 acre feet, and we are here assuming what is not the true condition, that it is practicable to construct reservoirs to store water for the use of all appropriators so as to make the average flow of the stream available as the actual water supply. Whether this amount of water is sufficient to irrigate this area of land, leaving a balance of 70,000 acre feet or more for diversion by Colorado in addition to the amount already diverted through the Skyline and Divide ditches, depends, using the method of argument adopted by Colorado, upon the theoretical duty of water.

c. The Theoretical Duty of Water

A discussion of the theoretical duty of water leads into a maze of opinions, assumptions and surmises, to which that arising from a discussion of stream flow records is not comparable. The all-important factor in determining how much water is necessary to irrigate a given area of land is the physical situation. If the subsurface water table is close to the surface as it is in the Poudre valley, since three million acre feet of water has been poured into the ground, a much smaller amount will be needed than if the water table is far below the surface as is true of the Laramie Plains; if the soil is thick as it is in the Poudre Valley, less water will be needed than in the Laramie Plains, where the soil, if we believe all the Colorado witnesses say about it, is nothing but gravel. If the climate is so favorable that intensive cultivation of high priced crops is profitable, the methods of use which can be adopted will lead to a higher duty of water than in a region where hay is the principal crop.

Mr. Field states that under one of the very large canals in the Poudre Valley, the average consumption of water was about 1.2 acre feet per annum; that through the re-use of seepage water the net duty of water is less than one acre foot per acre per annum, and that in his opinion the net duty of water in the Poudre Valley as a whole will ultimately rise to three-fourths of an acre foot per acre (p. 3415). Mr. Meeker testified that in his opinion the duty of water in one district of the Laramie Plains where the ditches are close to the river, is about one acre foot per acre (p. 4317). The manager of the Wyoming Development Company system, serving the Wheatland district, testified that the net distribution of water to the Wheatland lands in 1912 was between 2.6 and 2.7 acre feet per acre, (p. 212), and that in 1912 the distribution to the lands under the United States Reclamation Service project on the North Platte River just below the mouth of the Laramie River was 2.55 acre feet per acre, and in 1911, 4 acre feet per acre. (p. 213) Perhaps the fairest opinion is that of Mr. Field himself in his 1910 report upon the Riverside ranches near Laramie City. The report was intended for use in a colonization project, and the adequacy of the water supply was of course the most important feature upon which the opinion of the engineer would be valuable, and there would accordingly be no inclination on the part of the engineer to state that an excessive amount of water was necessary for the proper irrigation of land, because it would be harder to demonstrate the existence of such a large supply. He there stated as his opinion (p. 3626) that two and one-half acre feet per acre per annum was doubtless an ample supply. This is less than the amount of water distributed upon

the Wheatland lands, and upon the lands under the interstate canal of the Reclamation Service, districts where intensive cultivation is being practiced, and we may safely conclude is not unreasonably high. Upon this basis 146,199 acres of land having prior appropriations from the Laramie River in Wyoming would require 365,498 acre feet of water, or 55,000 acre feet in excess of the average flow of the Laramie and Little Laramie Rivers.

But we believe there is a more satisfactory method of determining the adequacy of the water supply of this stream, viz.: by showing that in fact the entire flow has been used without waste. This method requires no consideration of stream flow records leading necessarily to an unsatisfactory conclusion, nor any determination of the exact acreage of land irrigated, nor any conclusion as to the theoretical duty of water.

Wyoming has shown that all of the water of the river has actually been used excepting in the year 1909, since the completion of the Wheatland No. 2 Reservoir in 1901. Colorado has been able to meet this proof and its effect only by insisting that a large amount of water has been wasted, and in support of this claim has introduced much evidence that the appropriators on the Laramie Plains have taken all of the water they have wanted without any control being exercised by water officials, and that many of the ditches have no dams at their headgates to raise the water when the stream is very low, drawing the inference from these facts that there is no pressure for water and that the supply is superabundant.

It must be conceded that such conclusions might properly be drawn from such facts under ordinary circumstances, but the condition upon the Laramie

River is peculiar. By far the largest appropriation from the river is that of the Wyoming Development Company for the Wheatland system, and as shown by the tabulation of priorities which we have presented, this appropriation is also one of the earliest in priority. Accordingly it has been necessary for the upper appropriators to permit a large volume of water to pass their headgates, and since in low stages of the river the total stream flow is not equal to the appropriation of the Wyoming Development Company, the upper appropriators have no right to divert any water from the river at such periods and there would be no advantage to them in constructing diversion dams to enable them to take water at such times. That the absence of diversion dams is not indicative of a superabundant water supply if the large and early priorities are at the lower end of the stream, is fully recognized by the Colorado expert, Prof. Carpenter (pp. 2386-87).

The evidence with respect to the alleged waste of water upon the Laramie Plains is discussed at considerable length and with many quotations from the testimony, in our original brief, pp 60-63, and we feel we can add nothing to that discussion.

Finally, in considering the adequacy of the water supply of the river, assuming that the average flow of the stream over a long period of years and not the flow in any single year must be considered, it must be noted that as a matter of fact Wyoming has done just what Colorado insists it should do, and that even under these circumstances a shortage of water supply is experienced. Colorado contends that we should construct reservoirs; we have constructed a reservoir, the Wheatland No. 2 Reservoir, which being connected with the largest and one of the earliest priorities and

situated at the lower end of the Laramie Plains below substantially all of the ditches of later priority, acts in the words of Mr. Field (p. 3671) "as an equalizer of the whole stream during the season and from year to year, as it is never necessary to permit water to waste, and by the conserving of water when not needed upon the Wheatland tract relieves the demand on the river and makes it possible for higher ditches to get water when otherwise they might not be able to do so, if there was a shortage in the water supply", a situation which of course Mr. Field insists does not now exist. He further says (p. 3671), "Since its completion the Wheatland Reservoir has very largely increased the effectiveness of the whole river, and its capacity is so large that it can practically conserve the flow of the river."

While the Wheatland appropriation from the direct flow of the stream would exhaust the stream during a large part of the irrigation season, it has not been necessary for the Wyoming Development Company to enforce against the upper appropriators its right to the direct flow, for only a part of the entire acreage in the Wheatland district has as yet been cultivated, and the capacity of the reservoir is sufficient when added to the water that the upper appropriators permit to flow down the river to supply this land, the upper appropriators not trespassing too far upon the tolerance of the lower and prior appropriator by constructing water-tight dams and diverting all of the water in the river during the lower stages. Under this arrangement the upper appropriators secure the benefit of the direct flow of the stream and the lower and prior appropriator relies upon the flood waters, and the situation as a whole is exactly the same as though the upper appro-

priators had constructed reservoirs to conserve the flood waters and the lower appropriator was taking the direct flow of the stream. In substance, therefore, Wyoming has actually developed a storage system which enables it to make full use of the average flow of the stream to an even greater degree than is the case in the Poudre Valley, and having done so experiences a shortage of water which will necessarily be increased by any further diversion in Colorado.

VII. CONCLUSIONS TO BE DRAWN FROM WYOMING PERMITS RECENTLY ISSUED

But it is claimed by the State of Colorado that other conclusive evidence in the record supports the testimony of Colorado as to the adequacy of the water supply. In Volume 2 of their brief filed in this case, on pages 214 to 220 inclusive, also pages 228 and 229, the defendant has collected together the evidence supposed to be conclusive on these matters. This evidence consists of divers permits issued by the State of Wyoming on and after April 21, 1908, for the use of water from the Big and Little Laramie. These permits are in the transcript of the evidence as actually taken in the cause and filed herein, though they are not in the abstract of the evidence.

The conclusions reached by counsel are that the "total acreage for which permits have been granted by State Engineers of Wyoming since August 25, 1902, is 278,153.61 acres." And the conclusion goes on to say that "In addition to the above acreage thus granted permits, we have the Bath, Robertson McConnell and Bell No. 2 Reservoirs of The Laramie River Company's

system showing an additional grant from the River of 451,019 acre feet." From this counsel makes this conclusion:

> "Here we find the plaintiff state solemnly decreeing that *after all* lands then under irrigation, or for the irrigation of which permits and appropriations had theretofore been granted or vested, had been and would forever be supplied with sufficient water for their annual reclamation, there still remained in the Laramie River sufficient water to annually irrigate 278,153.61 acres additional, and furthermore, that there existed sufficient water in the stream to warrant the construction of reservoirs for the storage of over 450,000 acre feet of water for irrigation of these or still other lands, after having already supplied the enormous reservoirs included within the acreage permits above mentioned."

One trouble with the argument for the defendant as above outlined is that it proves far too much. Putting it all together and remembering that the evidence here shows that it requires much more than an acre foot of water to irrigate each acre, but assuming that only one acre foot is necessary, the conclusion of the defendant is that there would be at least 278,000 acre feet for the 278,000 acres in favor of which permits were granted, and 450,000 acre feet for the reservoirs outside of the 20,000 acre feet diverted to Colorado by the Skyline Ditch and outside of the water required to irrigate more than 150,000 acres which had prior rights in Wyoming. In other words, this argument would prove that the average available supply from the stream is more than 898,000 acre feet. But the evidence from all years shows that there is not such an

amount of water even in the years of greatest floods, and even Colorado does not claim that the average annual supply of the entire drainage basin is more than one-half this much. There must, therefore, be some other explanation of the fact that these later permits are granted, and this explanation is not far to seek.

(a) These permits are *ex parte* by ministerial administrative officers. It is, therefore, impossible for these administrative officers when issuing permits for the use of water from a stream to adjudicate as to the amount of water already used by the hundreds of appropriators not made parties, or to adjudicate how much water remains in the stream after supplying such prior appropriators. The defendants are wholly in error in their frequent reference to the issuance of permits by a Wyoming State Engineer as a "solemn decree" that there is an ample supply of water for the purpose for which the permit is issued. The very word "permit" gives a wrong impression of the Wyoming method. None of these "permits" originate in the office of the State Engineer; their character is fully shown by Sections 727, 729 and 730, Wyoming Compiled Statutes of 1910, which provide that any person desiring to divert water from a natural stream shall prepare an application setting forth all important data which shall be filed in the office of the State Engineer, who after requiring such further information as he may find necessary, shall either indorse upon the application his approval or his disapproval. The application so approved is the so-called "permit". The difficulty in determining *ex parte* just how much water is available, the certainty that a very large proportion

of all permits, particularly for large projects, will never be followed up by actual construction, the appearance before the engineer of only one party, the applicant, all have led to a practice well exemplified in this very instance, of approving all applications which comply with the regulations of the office and letting the applicant take his chance upon the water supply.

(b) The method followed by Wyoming is not different in this particular from that followed in Colorado. Mr. Armstrong, a witness for the State of Colorado, testifies that he has been water commissioner or acting water commissioner of that water district in Colorado which includes the Cache la Poudre River and its tributaries for twenty-four years (p. 2454). He further testifies as follows:

> "Decree of water right on Cache la Poudre River or any other stream, does not amount to guarantee that the owner will receive amount of water specified in decree, unless it is among the very earliest priorities. It is a pretty good guarantee if the priority is early enough, but it would have to be pretty early. The decree merely represents that if there is enough water to supply all appropriators, then you can have the next turn at the water to the amount of your decree." (p. 2493).

Again, the Colorado engineer, Field, states that the decrees of the Colorado Court give to the Colorado ditches in the Laramie Valley 563 cubic feet per second, and he remarks:

> "Fact that these decrees are for excessive amounts does not change flow of river. A decree

> does not necessarily mean that there is that much water in river; neither does a decree put water in stream. (p. 3878)."

We have shown that the Wyoming "permit" is in no sense a "solemn decree", as stated by counsel for defendants. But here in Colorado we do have the "solemn decrees", for these decrees are judgments of the district courts of Colorado in contested proceedings. If Colorado assures us that such decrees prove absolutely nothing about the amount of available water supply, surely the Wyoming permits cannot be said to have any value in determining such question.

(c) In this case the permits, at least all of them which we have read, and we have read many of them, have this statement endorsed thereon:

> "The records of the State Engineer's office show the waters of the stream to be largely appropriated. The appropriator under the permit is hereby notified of this fact, and the issuance of this permit grants only the right to divert and use the surplus or waste water of the stream and confers no rights which will interfere with or impair the use of water by prior appropriators."

(d) So well understood in Wyoming is the practice of allowing permits whenever application is made, and the necessity for allowing them in that form without adjudicating as to the amount of water already appropriated or the amount of surplus in the stream, or indeed the question whether there be a surplus, that the people of Wyoming when they came to frame their constitution put into it on that subject this language:

"No appropriation shall be denied except when such denial is demanded by public interests." Wyoming Constitution, Article 8, Section 3.

We submit, therefore, that proof of permits issued after 1908 and the amount of water covered by them has no practical bearing upon the question of the actual amount of water in the stream; certainly no bearing whatever on the amount of water in the stream in average years, or upon the amount of water in the stream during the irrigation season in dry years.

SECOND

The Principles of Law Involved in the Case Applied to the Facts

---

SYNOPSIS

Colorado's Claims of Justification for Taking the Water. p. 128.

A. The Claim that Colorado Will take Only Surplus Water. p. 129.

1. General Doctrines of Prior Appropriation. p. 130.

(a) Right of Prior Appropriator existed in Both States even before Constitutions. p. 132.

(b) Rights of Prior Appropriator Are Exclusive. p. 134.

(c) Rights of Prior Appropriator especially Clear in Time of Water Deficiency, yet Colorado Will Take more Water at such Times. p. 140.

2. Effect of State Lines upon Rights of Appropriators. p. 153.

B. Colorado's Claim to an Equitable Division of the Waters. p. 165.

C. May Colorado Ignore Rights of Others by virtue of her Sovereignty? p. 187.

COLORADO'S CLAIMS OF JUSTIFICATION FOR TAKING THE WATER.

We believe that the evidence which we have sought to briefly analyze makes it clear that Colorado is endeavoring to divert from the Laramie River a very large amount of water, and that to say the very least such diversion is detrimental to Wyoming and her people.

As indicated above, Colorado admits both in the pleadings and in the evidence that she is intending to divert a large amount of the water. This she attempts to justify, as we have seen, on three grounds, which we will here repeat.

A

She contends that there is an abundance of unappropriated water in the Laramie River, and that her intention is to take only from the surplus and unappropriated waters.

B

She contends second that in case the doctrines and practices of prior appropriation would not justify her taking the water, she would still be permitted to take it on the ground that the waters should be equitably divided between the two adjoining States, and that her diversion as here intended will not transgress the principles of equitable division as applied to the situation existing between Colorado and Wyoming in relation to the Laramie River.

C

She contends that in case neither of her contentions as above shall be allowed, then that Colorado as a sovereign state may take all the waters found within her boundaries and use them as she will regardless of any supposed rights of others.

We shall attempt to discuss these three grounds in the order above given.

A

Colorado's claim that there is an abundance of unappropriated water and that she will take only from the surplus.

The very statement of her contention indicates that the claim here under consideration must rest on some principle of the doctrine of appropriation. The very language used in this part of Colorado's claim is language pertinent only to discussions of questions of prior appropriation, and it is evident that the defendants used this language with the full intention of claiming under the principles of prior appropriation.

In attempting to show that there is a surplus of water in the Laramie River out of which she is entitled to appropriate, Colorado uses the expression "normal flow" as probably indicating the average flow per year when a number of years in succession are considered.

As we have already seen, in the discussion of the evidence Colorado proceeds to deduct from this so-called "normal flow" such amount as she contends would be sufficient for Wyoming needs, and calls the

balance a "surplus". This method, as we have seen, leads only into error.

Again, Colorado adds together all the supposed flow of the Laramie River and all its tributaries, and calls that the flow of the Laramie River, and this no matter where the waters of the Laramie River are used in Wyoming for irrigation. The stream is not a mere level body of water, and appropriators near the head of the stream would not be particularly aided even by large floods of water at some point in the stream below them or at some point in some tributary stream which furnishes its water below. In other words, this method, on its face, leads only to error and confusion.

The General Doctrines of Prior Appropriation.

In this case the rules of prior appropriation are alleged in the bill of complaint and admitted in the answer to be as follows:

> "In accordance with the customs and usages of the people, recognized by the laws and decisions of the Courts of both Colorado and Wyoming, in all cases where prior rights to the contrary have not intervened it has been the custom to divert and apply the waters of the natural streams to supply the deficiency in the annual precipitation to cultivate the lands within the drainage basin of said streams and make the same productive. Under the said customs, usages, laws and decisions it has been established, enacted, held and decided in both States as to the waters of all streams and other sources of water supply where prior rights to the contrary have not intervened that such

waters are open for a reasonable appropriation and use for irrigation purposes; that except as aforesaid priority of appropriation gives priority of right."

The Constitution of Colorado, Article 16, Sections 5 and 6, contains this language:

"Sec. 5. The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the State, subject to appropriation as hereinafter provided."

"Sec. 6. The right to divert unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes."

Many Colorado cases state and illustrate the same doctrine.

Coffin v. Left Hand Ditch Co., 6 Colo. 443.
Hammond v. Rose, 11 Colo. 524.
Schilling v. Rominger, 4 Colo. 100.
Wyatt v. Larimer etc. Irrigation Co., 1 Colo. App. 480.
Beaver Brook Reservoir Co. v. St. Vrain Reservoir Co., 6 Colo. App. 130.

The Constitution of Wyoming, Article VIII., Sections 1 and 3, are as follows:

> "Section 1. The water of all natural streams, springs, lakes or other collections of still water, within the boundaries of the State, are hereby declared to be the property of the State."
>
> * * * * * * *
>
> "Sec. 3. Priority of appropriation for beneficial uses shall give the better right. No appropriation shall be denied except when such denial is demanded by the public interests."

The decisions in Wyoming further illustrate the same matter.

Farm Investment Co. v. Carpenter, 9 Wyo. 110.
Willey v. Decker, 11 Wyo. 496.

Throughout the arid region the rule is more or less similar, though in some the doctrine of prior appropriation is made more or less subordinate to the general doctrines of riparian rights.

Atchison v. Peterson, 1 Mont. 561.
Crane v. Winsor, 2 Utah, 248.
Jones v. Adams, 19 Nev. 78.
Barnes v. Sabron, 10 Nev. 217.
Irwin v. Phillips, 5 Cal. 140.
Kidd v. Laird, 15 Cal. 161.
Sharp v. Hoffman, 79 Cal. 404.
Lux v. Haggin, 69 Cal. 255.

Right to Appropriation existed in both States Prior to Constitutions.

Indeed it is held in both States that this principle

existed as the law of the region prior to the enactment of their constitutions.

"The history of water rights in this State will show that the rights and principles declared in the constitution were recognized and acted upon by the people years before they were formulated and declared in that instrument; that such rights had their inception in the earliest attempt at agriculture, when it was found that climatic conditions demanded the artificial use of water to produce crops. The title of the public and the people to the water in the streams, and the right to divert and appropriate, were recognized and acted upon, the only requirement being an application to a beneficial use; and such rights to the use of water as between different consumers or users were established upon the broad equitable basis that preferences were to be controlled by the respective dates when the conflicting appropriations were made."

Wyatt et al., v. Larimer-Weld Irrigation Co., 1 Colo. App. 480, 497, (29 Pac. 906).

"The common law doctrine relating to the rights of a riparian proprietor in the water of a natural stream, and the use thereof, is unsuited to our requirements and necessities, and never obtained in Wyoming. So much only of the common law as may be applicable has been adopted in this jurisdiction. The doctrine invoked is inapplicable. A different principle better adapted to the material conditions of this region has been recognized. That principle, briefly stated, is that the right to the use of water for beneficial purposes depends upon a prior appropriation. Our statutes have repeatedly recognized this right, and the constitution of the State declares it. We incline strongly to the view expressed by the Supreme Court of

Colorado, to the effect that such right and the obligation to protect it existed anterior to any legislation upon the subject."

Moyer v. Preston, 6 Wyo. 308, 318.

The Right of the Prior Appropriator is Exclusive.

In both Colorado and Wyoming and in every other State where irrigation is practiced, it is held to be the only equitable rule that the rights of a prior appropriator shall be considered exclusive, and that he shall at all times take from the stream such amount of water as he needs up to the full amount of his appropriation without any requirement that he shall divide with other appropriators in times of scarcity. As a necessary result of this doctrine, it is everywhere held that the prior appropriator has a right to the stream as he originally found it; that he is not obliged to build reservoirs nor store the water, but has the right to take it from the stream as it was running when he first appropriated, and without any requirement that he shall make any expenditures whatever in order that others may have water. Indeed to require that he shall incur the expense necessary in storing the water would often be to destroy his priority, since the expense of such storage would be more than the value of his prior right.

"As opposed to the correlative rights of the common law, whereby all riparian owners on the stream have equal rights, under the law of appropriation the rights of the claimants are unequal. Each has an exclusive right to the extent of his prior appropriation, and appropriations vary great-

ly in the extent of right appropriated. 'A party appropriating water has the *sole and exclusive* right to use the same for the purposes for which it was appropriated.' So long as the water is put to beneficial use, priority alone governs. Full protection is given to the prior appropriator against all later comers. This exclusiveness includes the right to tributaries and sources, even tributary percolating water so far as proof traces it as tributary, and also storm waters that are of annual occurrence. It is held: 'The prior appropriator of a particular quantity of water from a stream is entitled to the use of that water, or so much thereof as naturally flows in the stream, unimpaired and unaffected by any subsequent changes which, in the course of nature, may have been wrought. To the extent of his appropriation his supply will be measured by the waters naturally flowing in the stream and its tributaries above the head of his ditch, whether those waters be furnished by the usual rains or snows, by extraordinary rain or snow fall, or by springs or seepage which directly contribute.' It is said, 'The appropriator took the water with the right to have the stream flow as it was wont to flow', which is as strict a statement as the '*aqua currit et debet currere ut currere solebat*' of riparian rights."

1 Wiel on Water Rights (3d Ed.) Section 279.

"But the prior appropriator of the waters of a certain stream has the right to insist that the water continue to flow as it did when he first made the appropriation, as far as the interference by other subsequent appropriators is concerned. 'The appropriator took the water with the right to have the stream flow as it was wont to flow' is the language of the law under the Arid Region Doctrine of appropriation, which is as strict a rule as that of the common law of riparian rights,

aqua currit et debet currere ut currere solebat. He has also the right to insist on this flow and that no change be made in it by later comers to his material injury."

2 Kinney on Irrigation (2d Ed.) Sec. 801, p. 1398.

"It is a recognized rule of law that a person who has appropriated water at a certain point in a stream is entitled to have so much of the waters of said stream as he has appropriated flow down to him to the point of his diversion."

Conant, et al., vs. Deep Creek etc. Irr. Co., et al., (23 Utah 627), 66 Pac. 188, 190.

"The reasons which constitute the groundwork of the common law upon this subject remain undisturbed. The conditions to which we are called upon to apply them are changed, and not the rules themselves. The maxim, *sic utere tuo ut alienum non laedas*, upon which they are grounded, has lost none of its governing force; on the contrary, it remains now, and in the mining regions of this State, as operative a test of the lawful use of water as at any time in the past, or in any other country. When the law declares that a riparian proprietor is entitled to have the water of a stream flow in its natural channel *ubi currere solebat* without diminution or alteration, it does so because its flow imparts fertility to his land, and because water in its pure state is indispensable for domestic uses. But this rule is not applicable to miners and ditch-owners, simply because the conditions upon which it is founded do not exist in their case. They seek the water for a particular purpose, which is not only compatible with its diversion from its natural channel, but more frequently necessitates such

diversion, and moreover does not require the water in a pure state in order to insure its reasonable and beneficial use. Yet the maxim above mentioned upon which the rule founded is equally as applicable to the ditch-owner and to the miner as to the riparian proprietor, and neither can so use the water as to injure or prejudice the prior rights to a like use by the other. This maxim is one which every riparian proprietor is bound to respect, and it is no less obligatory upon those who use and divert water for mining purposes. So that in all controversies like the present the question to be determined after all is the same as that presented by a like controversy between riparian proprietors, to-wit: has the plaintiff's use and enjoyment of the water *for the purposes for which he claims its use been impaired* by the acts of the defendant? This is purely a question of fact for the jury, and all the law applicable to it is found, as stated by the learned counsel for appellants, in the case of the Phoenix W. Co. v. Fletcher (23 Cal. 483), embraced in the three following maxims: *Qui prior est in tempore, potior est in jure*; *Ubi jus, ibi remedium*; *Sic utere tuo ut alienum non laedas*; and beyond these principles they do not require to be instructed. What diminution in quantity or what deterioration in quality will injuriously affect the use of the water by the plaintiff may be safely left to the determination of the jury, guided only by the foregoing maxims."

Hill vs. Smith, 27 Cal. 476, 482.

"The right to the use of the running water (that is, the right to appropriate water on one's own land) is a corporeal hereditament; but the water when once appropriated includes and comprehends an incorporeal hereditament, to-wit, the right to have the water flow in the stream, without diminution or deterioration, to the head of the ditch or

place of diversion—an easement in the stream, and a servitude upon upper riparian lands."

Smith vs. Deniff, (24 Mont. 20), 60 Pac. 398, 400.

"The prior appropriator is clearly entitled to protection against acts which materially diminish the quantity of water to which he is entitled, or deteriorate its quality, for the uses to which he wishes to apply it."

Phoenix Water Co. vs. Fletcher, 23 Cal. 482, 487.

"The right acquired to water by an appropriator under our system is of the same character as that defined by the foregoing authorities as an incorporeal hereditament and easement. The consumer under a ditch possesses a like property. He is an appropriator from the natural stream, through the intermediate agency of the ditch, and has a right to have the quantity of water so appropriated flow in the natural stream, and through the ditch, for his use."

Wyatt vs. Larimer & Weld Irrigation Co., 18 Colo. 298, (33 Pac. 144, 150).

"To the proposition that appropriators of water out of a natural stream for irrigation purposes, with priorities decreed, are entitled to have the conditions substantially maintained upon the stream as they were when the appropriations were made, and have existed during the continuance and perfection of such appropriations, we cite the following authorities: Handy Ditch Co. vs. Louden Irrigating Canal Co., 27 Colo. 515, 62 Pac. 847; Ft. Lyon Canal Co. vs. Chew, 33 Colo. 392, 81 Pac. 37; New Cache La Poudre Irrigation Co. vs. Water Supply & Storage Co., 29 Colo. 469, 68

Pac. 781; Baer Bros. Land & Cattle Co. v. Wilson, 38 Colo. 101, 88 Pac. 265; Cache La Poudre Reservoir Co. vs. Water Supply & Storage Co. et al., 25 Colo. 161, 53 Pac. 331, 46 L. R. A. 175, 71 Am. St. Rep. 131; and Vogel et al. vs. Minnesota Canal and Reservoir Co. et al., 47 Colo. 534, 107 Pac. 1108."

Comstock vs. Ramsay, 55 Colo. 244, 257, (133 Pac. 1107, 1111.)

"The doctrine that the first appropriator has the superior right, 'where the right to the use of running water is based upon appropriation, and not upon an ownership in the soil' has been recognized and acknowledged by the decisions of this Court in Lobdell vs. Simpson (2 Nev. 274), and the Ophir S. M. Co. vs. Carpenter et al. (4 Nev. 534).

"The facts of this case do not call in question the correctness of the decision in Van Sickle vs. Haines (7 Nev. 249), where the title to the land had been obtained from the government prior to the acts of Congress herein referred to.

"It logically follows from the legal principles we have announced that the plaintiff, as the first appropriator of the waters of Currant Creek, has the right to insist that the water flowing therein shall, during the irrigating season, be subject to his reasonable use and enjoyment to the full extent of his original appropriation and beneficial use."

Barnes vs. Sabron, 10 Nev. 217, 233.

" 'That a valid appropriation of water from a natural stream constitutes an easement in the stream, and that such easement is an incorporeal hereditament, the appropriation being in perpetuity, cannot well be disputed.' He refers to the discussion of property in water by Washburn in his work on Easements and Servitudes (p. 276),

and Angell on Water Courses (Sec. 141), and adds: 'The right acquired to water by an appropriator under our system is of the same character as that defined by the foregoing authorities as an incorporeal hereditament and easement. The consumer under a ditch possesses a like property. He is an appropriator from the natural stream, through the intermediate agency of the ditch, and has the right to have the quantity of water so appropriated flow in the natural stream, and through the ditch for his use.'"

Willey vs. Decker, 11 Wyo. 496, 544.

The Act of Congress of July 26, 1866, contains this language:

"Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledged and confirmed."

Revised Statutes, Sec. 2339.
United States vs. Rio Grande Dam etc. Co., 174 U. S. 704.

The Rights of the Prior Appropriator are Especially Active in Time of Water Deficiency, yet Colorado will Take More Water at such Times.

As we have indicated, the plan proposed by Colorado in the argument here leads only into error. Colo-

rado proposes that the so-called normal flow of the stream shall be ascertained, and that from this so-called normal flow shall be deducted for use in Wyoming such an amount of water in gross as shall equal the Wyoming appropriations that are prior to the inception of the Colorado enterprise, and that the remainder thus ascertained shall be held to be the amount of water which Colorado may divert from the stream. This is called by Colorado the "surplus" or unappropriated water.

Any study of the evidence discloses that this so-called normal flow is ascertained by adding together the supposed annual stream flow of the various years and dividing the result by the number of years taken.

As we have seen in this case, it has the additional error of being estimated not so much by study of the actual measurements of the Laramie River as by theoretical amounts of water obtained from a supposition (denied by the evidence) that a certain number of square miles of arid land in Wyoming might yield a certain number of acre feet of water, and also by a supposition that the amount of water flowing in the Laramie River can be ascertained by measuring the Poudre, an entirely different stream, flowing in a different direction, having its own water and its own peculiar features.

And besides there is error in that no allowance is made for the losses in the stream from evaporation and seepage. As stated even by the witnesses for the defendants:

> "Our plains streams are of a very different type from streams in eastern states. With stream running through humid country, at least in eastern United States and most humid countries, streams steadily increase. Country through which it runs

is contributing to stream. That is not case of our plains streams—after they leave mountains. We cannot say that these plains streams are actually draining the country in sense of deriving supply of water from the country most of time. These streams are naturally decreasing instead of increasing as they go away from the mountains. They have always done so from earliest period of discovery and, inasmuch as these conditions have existed for a long period, undoubtedly it has always been the case."

(Testimony of Mr. Carpenter, Record Vol. 2, pp. 3006, 3007.)

But the error we desire to point out here is still a different one. If the actual flow in the Laramie River by actual measurements were ascertained to be in accordance with the testimony of Mr. Field, the Colorado expert on that question, still the plan of settling the rights between the parties here by taking the average flow of the stream as suggested, calling that the "normal flow" and giving Colorado the right to take *first* what they choose to term the "surplus" of the water—that is to say the difference between this so-called normal flow and the amount required for Wyoming—is to deprive Wyoming irrigators, in practically every season, of the water to which they are entitled. This is easily demonstrated.

This so-called normal flow has in it as a large element the various floods in the stream, and it would be manifest without evidence on the subject that these floods are not available for irrigation. On this question Mr. Carpenter, one of the leading witnesses for the State of Colorado, testifies as follows:

"With regard to financial practicability of construction of reservoirs on Poudre River capable of conserving extraordinary floods, will state that they call for an expenditure that could be utilized only occasionally. It would be similar to financial proposition of people in Florida preparing to heat their houses in the same manner as those in the northern part of the United States."

Record Vol. 2, Star Page 3946.

On the same subject Mr. Wortham, another one of the Colorado experts, testified as follows:

The very great floods on that watershed we cannot consider because we cannot construct works to take care of them.

Record Vol. 1, Star Pages 2120 and 2121.

"No witness testified to the contrary, and indeed this seems self-evident. Moreover, counting the flood waters as a part of the normal flow, and permitting Colorado *first* to take out all of the normal flow, save the amount estimated to be necessary for Wyoming, necessarily puts the whole of such flood waters into that part of the water apportioned to Wyoming. Colorado is at the head of the stream, and whatever she takes must be taken first. It in effect gives her a priority on the stream for the full amount allowed to her. It is, therefore, a mathematical certainty that the burden of the variations from day to day, and year to year, in the stream flow would fall upon Wyoming. Wyoming, then, would be apportioned as a part of her necessary amount the whole of the floods. And this notwithstanding that it would be as unreasonable to construct works to take care of such floods as it would

be to build great furnaces for heating houses in Florida as large and efficient as are required to heat houses in Boston. And this would also be in the teeth of that principle of law in the irrigation states which requires the newcomer to the stream himself to provide ways to catch surplus waters, and compels him to permit the stream to flow as it was wont to flow to the extent necessary to fully supply prior appropriators. It will be remembered that the concededly prior appropriators above the point where the Little Laramie turns its waters into the Laramie River are irrigating many thousand acres of land, and as it stands with no diminution such as is threatened they have insufficient water in many of the years. This is shown by the evidence as to irrigation previously cited in this brief. It will also be remembered that these concededly prior appropriators have no reservoirs, and though beneficially using the water, do not get returns to pay for the construction of reservoirs. On this question Mr. Carpenter, testifying for the State of Colorado, says this:

> "In my opinion hay is the economical crop raised upon the Laramie Plains, this being due to the soil and climatic conditions and not to any lack of enterprise on the part of the inhabitants. I presume that the raising of hay produces some net return, but the large size of ranches would indicate that the return is not very great. While some farmers favorably located and favored with some exceptional season might procure a net return and perhaps a large net return from some special crop, on the whole no other crop would now pay or could be looked to in the future as a paying crop. *I do not believe that the returns from the growth of hay would justify any greater investment than the present investment, and I should say that the present investment is now larger than the*

hay return would warrant. The only practical method of irrigating hay land in that region is through flood irrigation, and taking present conditions as a whole, the methods of irrigation now in use on the Laramie Plains are the natural methods."

Record, Vol. 2, Star Page 2984.
(The italics are ours.)

Along the same line as the question of the flood flow is the fact that the flow of the stream is not regular or constant, but greatly fluctuates not only from year to year, but from month to month, and even from day to day. This is shown by all the evidence. But an inspection of the table prepared and introduced in evidence by Colorado marked Exhibit 128, Star page 3440, sufficiently shows these irregularities. The Colorado plan of figuring up as the normal flow of the stream the average annual flow takes no account whatever of these irregularities and variations, but assumes, contrary to the fact, that the flow is constant, and then fixing a certain figure as this assumed normal, constant flow, asks the Court to permit Colorado to deduct from this assumed constant flow a certain amount of water, which Colorado is pleased to term a "surplus", and this certain amount of water is to be taken by Colorado, day by day, month by month, and year by year, at the times when she can take it, amounting in the aggregate, according to their figures, to 70,000 acre feet per annum, in addition to the 20,000 acre feet every year diverted by the Skyline Ditch. The method that would be used in taking this water on the part of Colorado is disclosed by the record. For example, the first volume of the brief heretofore filed in this cause by Colorado, page 17, lines 31 to 36,

has this solemn statement by those representing Colorado as to her purpose and intention:

> "It will, of course, be recognized that any test of the amount of water flowing in the Laramie River must be based upon what appears to be the normal flow rather than upon the flow for any particular year, *inasmuch as the proposed diversion which is sought to be restrained will, unless enjoined, constitute a continuing diversion.*"
>
> (The italics are ours.)

The matter is further illustrated by the testimony. Mr. Wallace Link, a witness on behalf of the defendant Colorado, testifies that,

> "In the spring the Skyline Ditch is first opened at what they called Three Quarter Creek. They then open up ditch above that point by shoveling for the entire length. They cut a trench through the snow in order to get the water through to cut the snow with water, and they continue that on to the head of the ditch *and it is very often June 15 before we get the water running.*"
>
> Record, Vol. 1, Star Page 2021. (Italics ours.)

Mr. Field, another witness for the State of Colorado, throws further light upon this same purpose. He says:

> "In diversion of water from one watershed to another, there is a greater percentage of water supply furnished by district from which water is taken during low year than during high year, that is, percentage of water diverted from Laramie River over to Poudre River during year of low flow is larger in comparison with flow of that year than water diverted in high year is to water flow during that year. For example, amount of water diverted through Skyline Ditch would be more

clearly constant from year to year than would average flow in Laramie River from year to year. Reason is that during year of low flow on Laramie River there would probably be a year of low flow on Poudre, which would create greater demand on Poudre for water and probably greater effort would be made to bring more water during low year. On other hand in high year, it would probably not be so necessary and the same effort would not be made."

Record, Vol. 2, Star Pages 3401 and 3402.

Another witness for the defendants in testifying as to the intentions of the Colorado enterprise in the matter of taking water from the Laramie River, testified as follows:

"The really dependable water supply of the District will come from the Laramie River, the amount secured from the Poudre River fluctuating greatly and being used to augment the supply from the Laramie. There will be years when the supply from the Poudre River and its tributaries will be practically nothing. Our plans contemplate taking all the water that it is possible for us to take from the Laramie River each year. It is possible to get only a certain amount from that river, and I do not believe that we can absolutely depend on more than half the required amount from the Laramie River. The very great floods on that watershed we cannot consider because we cannot construct works to take care of them. It is our plan and expectation to take all the water we can get from the Laramie River each year irrespective of the amount of water in that river from year to year."

(Testimony of John R. Wortham, the Engineer for the defendant The Greeley-Poudre Irrigation District, Rec. Vol. 1, pp. 2120 and 2121).

In other words, the threat of Colorado is to take a constant amount of 70,000 acre feet per annum in addition to the 20,000 acre feet each year diverted by the Skyline under an older diversion, and to take this largely during the irrigation season, and to take it with even more certainty when the flow in the Laramie River in the irrigation season is least.

Turning again to the table, Exhibit 128, introduced by Colorado, Record Volume 2, Star Page 3440, it will be found that in many of the years the entire flow of the Laramie River for the months of July, August and September would not equal the 70,000 acre feet which Colorado is threatening to divert.

The authorities are very clear as to the rights of the prior appropriator in times of water deficiency.

> "In the case at bar the waters of Antoine Creek were appropriated and being used at the time respondents settled and filed on their land, and were not subject to a riparian right to use the waters for irrigation, as against the first appropriator who has perfected his title and was with reasonable diligence extending the area of cultivation on his lands riparian to the stream. 'It is an elementary principle of the law of appropriation of water for irrigation that the first appropriator is entitled to the quantity of water appropriated by him, to the exclusion of subsequent claimants by appropriation or riparian ownership.' *Longmire vs. Smith, supra.*
>
> "It is unfortunate that the flood waters of Antoine Creek cannot be conserved for the use of all, but, so long as our laws measure the rights of the appropriator of water by the necessities of the dry season, the first in time must be held to be the first in right. The just purpose of the trial judge to apportion the waters cannot be sustained in the light of the evidence showing that there is

no excess of water running to, or waste by, the appellants."

Avery vs. Johnson, 59 Wash. 332, (109 Pac. 1028).

"The testimony in the case, the findings of the jury, as well as the findings of the court, clearly determined that Henry Huning had the first right to the amount of water decreed to him; and the court, in its judgment, recognized that fact, and decreed that he 'had, and should have and enjoy, the first right to' that amount of water for the purpose of irrigating that acreage of land, after which it was error to decree that the Scott Bros. were on a parity with him, and that he enjoyed no priority as to them.

"It is assigned as further error that the court found in its decree that the defendants R. and J. Scott and the plaintiff, Henry Huning, have no priority of right to the use of waters in said creek over the other defendants, and in finding, contrary to the evidence and the verdict of the jury, that at all times there had been sufficient water in the creek for plaintiff and defendants Scott.

"The first error complained of in this assignment is incorrectly stated. The decree of the court did not decide that defendants R. and J. Scott and plaintiff, Henry Huning, had no priority of right as against the other defendants, but that they had no priority as against each other, thus putting them on a parity in the rights to use the water.

"The second assignment is incorrectly stated, as no such decree is contained in the judgment, although the court did find among the findings of fact that there had at all times up to that date been sufficient water in the creek for plaintiff and defendants. That fact, however, is immaterial; and the court ignores it in the decree quoted above,

wherein it provides that, in case of scarcity or failure in the flow of the creek, Huning and the Scotts should prorate the amount of water the creek might furnish. When the relative priority in which the rights exist is determined, it is immaterial whether or not the stream furnishes a sufficiency for all. The fact that the stream had before the date of trial furnished a sufficiency for all the parties litigant, or for a certain number of the parties litigant, would be no assurance that it would continue to furnish such sufficiency; and it is in order to provide for the proper distribution of the amount that may be furnished that the relative priority of the several rights enjoyed by the different parties are determined by the court."

Huning vs. Porter, 6 Ariz. 171, (54 Pac. 584).

"In times of natural or other deficiency, also, unless otherwise provided by statute, the prior appropriator may still claim his full amount; the loss must fall on the later appropriators. In a case enforcing an appropriation to the extent of seventy-five per cent. of the whole stream, it is said: 'It further appears from this defense that at certain seasons of the year the flow of the stream will only supply the needs of the defendants. It appears, therefore, from the averments of this defense, that the defendants have a prior right to the use of the water from the natural stream, and, when low, to the entire volume thereof, and the demurrer thereto should have been overruled.' This is true even where (indeed, especially where) unusual scarcity or dry season causes the deficiency."

1 Wiel on Water Rights, Sec. 301.

(The case from which Mr. Wiel makes the quotation indicated last above is the case of Wellington vs. Beck, 30 Colo. 409.)

The principles above enunciated as to the relative rights of appropriators are uniformly and universally adopted by the irrigation states. In accordance with these principles Wyoming, during the irrigation season of each year, is entitled to the flow of the stream as it may at the time naturally flow up to the amount necessary to supply the Wyoming appropriations that are prior in time to the inception of the Colorado attempt at diversion. All of the evidence, without contradiction, shows that in practically every year during the irrigation season the entire stream flow is not only taken by the Wyoming prior appropriators, but is necessary for the purposes of irrigating their lands, and in many of the years—dry years as they are called—the water in the stream is insufficient for the concededly prior Wyoming appropriations. If the water were being diverted by Colorado into reservoirs within the watershed, then the objection to such diversion would be less serious unless in the diversion there was such loss as to work injury to the prior Wyoming appropriators. If it were diverted within the watershed, it would not be difficult under the Wyoming system, or indeed under any system, to require the owners of the reservoir in the watershed into which the water is diverted to turn it back into the stream for the use of the prior appropriators. This was done in the case of Lake Hattie in the year 1913. (Record Vol. 1, page 1288.) But in the case at bar, Colorado's diversion will take the water to a place where it will be impossible to return it to the stream, and therefore in every year when the water in the stream may turn out to be less than the amount of the prior Wyoming appropriations plus the Colorado diversion irreparable wrong will be done to the Wyoming appropriators, and in most of

the years the wrong will go to the extent of entirely depriving many of the Wyoming appropriators of water. But in not more than one year in seven could any substantial fraction of seventy thousand acre feet of water be taken during the irrigating season without depriving the Wyoming prior appropriators of necessary water.

If there is any way to ascertain in advance when, if ever, the water in the stream during the irrigation season will be more than enough for the prior Wyoming appropriators, and therefore will leave a surplus for the Colorado appropriation, we have no knowledge of it. The rain, like the wind, comes when it will. The heat is more or less each day during the summer, and therefore melts and brings from the mountains in the shape of water more or less of the snow just as an overruling Providence may direct. But no man knows what any day will bring, save that we do know that as a rule for all of the years during which records have been taken the amount of water furnished by the rains and the melting snows in the Laramie River has all been required by the Wyoming concededly prior appropriations, and the two or three years in the last twenty in which there has been a surplus have been unusual and it was impossible to anticipate them.

We submit, therefore, that if the State line between Colorado and Wyoming leaves the rights of appropriators as if all were in the same State, it would be clear that the Wyoming appropriators have the right to the water during practically every year; that the years when they will not need it all cannot be ascertained in advance, and that the diversion as intended by Colorado because of the character and place to which it will take the water will in most years cause

such injury and damage as entitle the Wyoming appropriators to injunctive relief.

Effect of State Lines upon Rights of Appropriators.

The question of the effect of State lines upon the rights of appropriators in different States has been before the courts of the arid region in a number of cases, and so far as we have been able to find has always been decided in the same way. The universal holding is that priority of appropriation gives priority of right on inter-state streams the same as on streams wholly within one State.

> "We had occasion recently to consider whether the right of a citizen to use water within the State for irrigation of lands is granted by the State or general government, and we were unable to discover any principle of that kind. Mohl vs. Larmar Canal Co. (C. C.) 128 Fed. 776. The idea of an exclusive right in the people of a State to divert its running waters to the injury of riparian owners in another State must be equally untenable. Indeed, the doctrine of riparian ownership and use of running water is not subject to political boundaries. Between hostile States the doctrine may not be recognized, but any such repudiation would be simple *vis major*. Between States dwelling in peace and concord, as are the States of our Union, the equal right of the inhabitants of each State to the waters of intersecting streams must always be recognized. Water is essential to human life in the same degree as light and air, and no bounds can be set to its use for supplying the natural wants of men other than the mighty barriers which the Creator has made on the face of the earth.
>
> * * * * * *
>
> "It is enough that complainants nd their

grantors were in the possession and enjoyment of the water a long time prior to respondents' diversion, and therefore the first appropriators under the law of the land as understood in Wyoming and Colorado."

Hoge vs. Eaton, et al., 135 Fed. 411, 414.

The above case was decided by the District Court of the United States for Colorado. The Judge who sat was on the Supreme Bench of Colorado before the admission of that State into the Union, and became United States District Judge upon the admission. The case was reversed by the Court of Appeals (Eaton vs. Hoge, 141 Fed. 64) but the reversal was upon another point and should not weaken the case as authority upon the point here under discussion.

"It would seem, upon both reason and authority, that the courts of this State, in ascertaining, decreeing, and protecting property rights in water appropriations within the jurisdiction of the State, may at the same time and for that purpose inquire into and determine rights and priorities on the same stream that are located and situated beyond the State line, in order to fairly and finally judicially determine the relative rights of the parties and decree the extent of the title and right of possession of the thing or subject-matter within this jurisdiction. This proposition ought to be accorded a special recognition and application by the courts in water and irrigation litigation. Streams rise in one State and flow into another, irrespective of boundary lines, and still the rules and doctrines of priority of appropriation and use are the same in most of the arid States. This is particularly true with respect to this case. Here the riparian doctrine of the common law has been abrogated in both Idaho and Wyoming, and the

rule of 'first in time is first in right' is recognized and enforced in both States. Drake vs. Earhart, 2 Idaho, 750, 23 Pac. 541; Moyer vs. Preston, 6 Wyo. 308, 44 Pac. 845, 71 Am. St. Rep. 914; Farm Investment Co. vs. Carpenter, 9 Wyo. 110, 61 Pac. 258, 50 L. R. A. 747, 87 Am. St. Rep. 918; Willey vs. Decker, *supra*. The relative rights, therefore, of appropriators of the water of an interstate stream are the same, whether the appropriations are all in the same State, or some in one State and the balance in another State. This proposition is accentuated in a case like this, where the court not only has jurisdiction of the *res* or subject-matter, but also obtains jurisdiction of the person of the defendant. In the case at bar the diversion by the defendants, being the act that causes the injury, takes place in Wyoming; but the injury itself that flows from the wrongful act takes place in this State. It has long been recognized as a general rule that, where an act is committed in one jurisdiction that occasions injury or damage in another jurisdiction, the injured person may elect to bring his action in either jurisdiction."

Taylor vs. Hulett, 15 Ida. 265.

"It is a recognized rule of law that a person who has appropriated water at a certain point in a stream is entitled to have so much of the waters of said stream as he has appropriated flow down to him to the point of his diversion; and if the settlers higher up on the stream, in another State, whose appropriations are subsequent, divert any of the waters of the stream which have been so first appropriated, then the courts of the latter State will protect the first settler in his rights. Howell vs. Johnson (C. C.) 89 Fed. 556. The Idaho courts, therefore, have ample and complete jurisdiction to protect the rights of respondents to

have the waters which they have appropriated, and which they divert in Utah, flow through the channel of the stream, and to limit and determine the rights of the Idaho appropriators with reference thereto; and by the decree entered in the suit in the district court of Oneida County, Idaho, such rights were fully protected, and may be enforced by proper proceedings in that court."

Conant vs. Deep Creek etc. Co., 23 Utah 627.

"This court has stated that the statutory and constitutional declarations seemed rather to declare and confirm a principle already existing than to announce a new one, for the reason that under the rule permitting the acquisition of rights by appropriation the waters became perforce *publici juris*.

* * * * * *

"The obvious meaning and effect of the expression that the water is the property of the public is that it is the property of the people as a whole. Whatever title, therefore, is held in and to such water resides in the sovereign as representative of the people. The public ownership, if any distinction is material, is rather that of sovereign than proprietor. (Farm Inv. Co. vs. Carpenter, *supra.*) That ownership however, is subject to a particular trust or use, specially defined in the statutes and in the constitution. And that trust or use, in the absence of statute, is just as prominently and intrinsically attached to such public ownership. The waters are held subject to appropriation for beneficial uses. And we have endeavored to show that the right of appropriation is not, in the absence of statute at least, restricted locally nor by state lines. The trust is to be considered as coextensive with the right on which it rests. Upon the general principles governing such appropriation, we perceive no reason, if the same be not

prohibited by statute, why the owner of lands in another State may not at a point in this State lawfully divert the water of a stream flowing in both States and conduct such water upon his lands for their irrigation, and thereby secure a valid water right. There is nothing in the essential character of the trust or use for which the waters are held by the public that, in our judgment, prevents the acquirement of a water right on such stream in that manner, provided the appropriator is able to comply with the statutory provisions regulating and controlling the appropriation and diversion of the public waters.

"Moreover, a desirable comity between the States within whose respective dominions the same stream may flow, and a due regard by each for the rights of the residents and land owners in the adjoining State, would seem to require a liberal view of this matter. In an interesting case in Wisconsin, where the question arose whether the State could constitutionally sell the ice formed upon public waters, it was held that where the term 'people of the State' is used to designate the beneficiaries of the trust in navigable waters, all the people who may choose to enjoy the same within the State are referred to, whether citizens of the State or persons who came within its territory, for the purpose of enjoying such public rights. (Rossmiller vs. State, 114 Wis., 169.)"

Willey, et al., vs. Decker, et al., 11 Wyo. 496, 533.

Farm Investment Co., vs. Carpenter, 9 Wyo. 110.

The case of Howell vs. Johnson (C. C. Mont.) 89 Fed. 556, involved a question between Wyoming lands and Montana lands, each party claiming appropriations from a non-navigable interstate stream.

The contention was made that the Wyoming citizens owning the Wyoming lands could not maintain the action in Montana because the State of Montana owned the waters in that State. This contention was overruled by the Court, which held that the rights must be determined without reference to State lines.

In the case of Anderson vs. Bassman, (C. C. Cal.) 140 Fed. 14, the same question arose between landowners in California and landowners in Nevada, each claiming as an appropriator of water from the same non-navigable interstate stream. The Court quotes from the cases of Howell vs. Johnson and Hoge vs. Eaton, *supra*, and endorses the views expressed in those cases, saying:

> "This court is in entire accord with the views of these two Courts upon this question."

In the case of Morris vs. Bean, (C. C. Mont.) 123 Fed. 618, the Court was considering the relative rights of Wyoming and Montana appropriators from the same interstate stream, and held that the prior appropriator is protected in his right "as against subsequent appropriators although the latter withdraw the water within the limits of a different State."

The final hearing of the case was in the same Circuit Court, but before a different Judge.

The contention was again made at the final hearing that an appropriator in Wyoming could not in a court in Montana assert rights as against an appropriator in Montana. The Court overruled this contention, announcing, among other things, the following:

> "In the early stages of this suit Judge Knowles refused to sustain the views thus presented by

the defendants. Whether the ruling made is the law of this case does not become material, because the reasons which actuated him in his decision are not only based upon sound principles, but are sustainable upon authority. No case has been cited where the distinction sought to be drawn has prevailed in the courts, but, on the contrary, apparently, wherever the question has arisen the holding has been the other way."

Morris vs. Bean, 146 Fed. 423.

The case last above cited went to the United States Circuit Court of Appeals for the Ninth Circuit and was there affirmed, the Court saying, among other things:

"The right to divert or appropriate for a useful purpose the waters of a non-navigable stream is recognized by the laws of Montana and Wyoming, and by sections 2339 and 2340 of the Revised Statutes (U. S. Comp. St. 1901, p. 1437); and the broad principle which underlies the relative rights of appropriators from the same stream is, that whoever is first in time is first in right, and the fact that the stream, the waters of which are appropriated, is interstate and non-navigable, does not affect the rule."

Bean vs. Morris, 159 Fed. 651, 655.

A similar question arose in the case of Miller, *et al.*, vs. Rickey, *et al.*, (C. C.) 127 Fed. 573. On appeal, the Circuit Court of Appeals for the Ninth Circuit used the following language:

"The water in the stream, which has a propensity to seek its level, and will continue in its current to the sea, is in strict reality the veritable thing in controversy. It knows not imaginary

State or county lines, and is a thing in which no man has a property until captured to be applied to a beneficial use. The right of appropriation is recognized in law, which means the right of diversion and use. It is the right, not to any specific water, but to some definite quantity of that which may at the time be running in the stream. So the right acquired by an appropriation includes the right to have the water flow in the stream to the point of diversion. The fact of a State line intersecting the stream does not, within itself, impinge upon the right. In other words, the appropriation may still be acquired although the stream is interstate and not local to one State. nor will the mere fact that the stream has its source in one State authorize a diversion of all the water thereof as against an earlier and prior appropriator across the line in another State. On the contrary, one who has acquired a right to the water of a stream by prior appropriation, in accordance with the laws of the State where made, is protected in such right as against subsequent appropriators, though the latter withdrew the water within the limits of a different State."

Rickey Land & Cattle Co., vs. Miller, et al., (C. C. A. 9th Cir.) 152 Fed. 11, 17.

The question has been somewhat involved in several cases before this court, but perhaps not clearly or definitely decided. In one case this Court uses the following language:

"It is conceivable, to be sure, that the decisions of this Court may determine that the States have rights as against each other *in invitum* in streams that flow through the land of both. Kansas vs. Colorado, 206 U. S. 46, 84. Missouri vs. Illinois, 200 U. S. 496, 519, 520. These rights may vary according to the system of law required by

natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older States. See New York vs. Pine, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper State, at least in the watershed of the stream, where irrigation is the condition of using the land. See Kansas vs. Colorado, 206 U. S. 46, 100-104, 117. But whatever this Court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his State, and those rights, the petitioner insists, can, or at least should be determined only in a suit brought by the State itself.

"We are of opinion that the petitioner fails to establish the conclusion for which it contends. The alleged rights of Miller and Lux involve a relation between parcels of land that cannot be brought within the same jurisdiction. This relation depends as well upon the permission of the laws of Nevada as upon the compulsion of the laws of California. It is true that the acts necessary to enforce it must be done in California and require the assent of that State so far as this Court does not decide that they may be demanded as a consequence of whatever right, if any, it may attribute to Nevada. But, leaving the latter possibility on one side, if California recognizes private rights that cross the border line, the analogies are in favor of allowing them to be enforced within the jurisdiction of either party to the joint arrangement."

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258.

And in still another case this Court uses this language:

"We know no reason to doubt, and we assume, that, subject to such rights as the lower State might be decided by this Court to have, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that State. Kansas vs. Colorado, 206 U. S. 46, 93-95. Therefore, subject to the same qualifications, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521. Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 260. But with regard to such rights as came into question in the older States, we believe it always was assumed, in the absence of legislation to the contrary, that the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the State that could be acquired from within. Manville Co. vs. Worcester, 138 Massachusetts, 89. Thayer vs. Brooks, 17 Ohio, 489. Slack vs. Walcott, 3 Mason, 508, 516. Stillman vs. White Rock Manuf. Co., 3 Woodb. & M. 538. Rundle vs. Delaware & Raritan Canal Co., 1 Wall. Jr. 275, 14 How. 80. Foot vs. Edwards, 2 Blatchf. 310. See Wooster vs. Great Falls Manuf. Co., 39 Maine, 247, 253, Armendiaz vs. Stillman, 54 Texas, 623; State vs. Lord, 16 N. H. 357. Howard vs. Ingersoll, 17 Alabama, 780, 793. There is even stronger reason for the same assumption here. Montana cannot be presumed to be intent on suicide, and there are as many if not more cases in which it would lose as there are in which it would gain, if it invoked a trial of strength with its neighbors. In this very instance, as has been said, the Big Horn, after it has received the waters of Sage Creek, flows back into that State. But this is the least consideration. The doctrine of appro-

priation has prevailed in these regions probably from the first moment they knew of any law, and has continued since they became territory of the United States. It was recognized by the statutes of the United States, while Montana and Wyoming were such territory, Rev. Stat., Secs. 2339, 2340, p. 429, Act of March 3, 1877, c. 107, 19 Stat. 377, and is recognized by both States now. Before the State lines were drawn of course the principle prevailed between the lands that were destined to be thus artificially divided. Indeed, Morris had made his appropriation before either State was admitted to the Union. The only reasonable presumption is that the States upon their incorporation continued the system that had prevailed theretofore, and made no changes other than those necessarily implied or expressed. See Willey vs. Decker, 11 Wyoming, 496; Smith vs. Deniff, 24 Montana, 20."

Bean vs. Morris, 221 U. S. 485.

"The rights of the respective States and of the citizens thereof in and to the use of waters of an interstate stream depend somewhat upon the laws of those States governing waters. If the common law is the only law of waters governing two adjoining States through which an interstate river flows, or if both States have adopted the Arid Region Doctrine of appropriation, the right to the use of the waters of an interstate stream is not affected by the boundary line which divides the States. But where there is conflict of the laws relative to the subject of water, that is to say, the lower State upon the stream having only the common law of riparian rights, and the upper State having adopted the Arid Region Doctrine of appropriation, the rule is different, and will be discussed in a subsequent section of this chapter.

"The rights as between appropriators of the

> waters of an interstate stream are not affected by the boundary line between the two States. As was said by a Wyoming case: 'The separation of lands capable of irrigation from such streams is of no consequence'. As was said in a recent Idaho case, 'The relative rights, therefore, of appropriators of waters of an interstate stream are the same, whether the appropriations are all in the same State or some in one State and the balance in another State.' 'The right to divert running waters for irrigating lands in an arid country is not controlled or affected by political divisions. It is the same in all States through which the streams may pass."
>
> 3 Kinney on Irrigation, (2d Ed.) Sec. 1225, page 2216.

Both Colorado and Wyoming are at the crest of the continent. They have both adopted to its broadest extent the doctrine of prior appropriation. It may be that this doctrine is not as entirely antagonistic to the doctrine of riparian rights as some text writers and some of the Courts near the crest of the continent seem to indicate. Of this we shall have more to say later. But whether it can stand alongside the doctrine of riparian rights in the same jurisdiction, (as it actually does in a majority of the irrigation States), or is so antagonistic as to exclude the latter, we believe that for the purposes of the decision of this case the doctrine of prior appropriation must furnish the rule. The people of both States by their constitutions have declared that doctrine to be the just and reasonable doctrine throughout the area involved in this litigation. The people by their representatives assembled in the legislatures have reiterated the same doctrine and provided numerous rules and regulations for carrying it

out in both States. The courts in both States have given their adherence, even to the extent of saying that the rule was in force in each State long prior to any constitutions or statutes on the subject. Therefore, so far as the parties here are concerned, that rule and doctrine must be held reasonable and just, and neither State could complain of its use in settling the controversy here.

Applying that doctrine and rule here, the appropriations in Wyoming that were by all the evidence prior and superior to the commencement and initiation of the threatened diversion here complained of, so use the waters of the stream and so need those waters as to make it certain that the threatened diversion cannot fail to work in most years, indeed in nearly all years, great and irreparable injury and damage to Wyoming and to the Wyoming appropriators. And as the evidence distinctly shows, these Wyoming appropriators and the communities and industries supported through their appropriations not only constitute a large share of the wealth and prosperity of the plaintiff State, but also furnish a large share of its taxation resources.

B

Does any Rule of Equitable Division of the Waters Justify the Threatened Diversion even though Injurious to Wyoming?

We might repeat here that the facts in the case at bar would permit and even justify a decision of this cause on the general principles of prior appropriation without deciding anything as to the rights of different

States whose differing climates have caused the adoption of rules and principles differing in the one State from those in the other.

We realize that the doctrine of prior appropriation is not recognized in all the States, and that if general principles are to be here decided such as shall apply to all interstate streams, and boundaries shall be here fixed to the rights of differing States in interstate streams applicable to all circumstances, in reaching such universal principles and conclusions there are many and serious problems entirely outside of the mere appropriation problems which we have so far discussed.

Wyoming and Colorado are at the crest of the continent. Waters falling within the State of Colorado flow out of that State, some of them to the Gulf of California, and some of them to the Gulf of Mexico; and it would be entirely possible within the State of Colorado to construct diverting systems which would take waters naturally tributary to the flow into the Gulf of Mexico and turn them into the streams emptying into the Gulf of California. Of course the States through which the waters would run in case of such diversion would be entirely different and separate from the States into and through which those waters naturally run. The same situation exists in Wyoming, even to a greater degree. Some of the waters of Wyoming flow naturally into the Missouri and Mississippi River systems, and thence into the Gulf of Mexico. Others of the waters of Wyoming flow into the Green River and the Colorado River and into the Gulf of California. Still others of the waters of Wyoming flow into the Columbia River and thus into the Pacific. No two of these systems naturally carry the waters through the same States after leaving Wyoming. Every State

watered by each system in any degree is an entirely different State from any State watered by any other of the systems. It would be entirely possible in Wyoming to construct diversion works such as would turn large bodies of the water from either one of the systems into the other. Each State receiving water from Wyoming has great need for the water. In the case of at least two of the systems the water from Wyoming flows into States and through States which refuse to recognize rights by prior appropriation as superior to riparian rights. In some cases the needed flow from Wyoming is into States which fully recognize the doctrine of prior appropriation. We recognize that Wyoming, if allowed to divert the waters from one stream and one system to another, could inflict vast injury upon sister States. It may not be amiss, therefore, for this Court to consider at least in the decision of this case, the general question of the effect of its decision on the problems which would naturally grow out of the attempt upon the part of Wyoming or Colorado to use within their own boundaries methods of diverting water such as will become injurious to sister States.

The streams rising in Colorado and Wyoming but illustrate the very general character of the questions involved if rules are sought applicable universally to rights on interstate streams. The stream in the case at bar rises in Colorado and flows into and through Wyoming and thence into Nebraska and on down into other States where the riparian rights doctrine pure and simple is adopted. The rights of Wyoming might easily be ground between the upper and nether millstone if Colorado should be permitted to take a large share of the water on some general principle of prior appropriation, while at the same time Nebraska and

lower States could require Wyoming to permit the waters to flow on down into the lower States practically undiminished in quantity.

The situation for Wyoming will be still worse—far worse—if Colorado shall be permitted to ignore the Wyoming rights acquired by prior appropriation, and also at the same time all riparian rights by taking waters for use not only within the watershed but also without, while leaving Nebraska and lower States the power to compel Wyoming to yield to Nebraska riparian rights.

In a case affecting rights in earth and air tried here, this Court said:

> "*The case has been argued largely as if it were one between two private parties; but it is not.* The very elements that would be relied upon in a suit between fellow-citizens as a ground for equitable relief are wanting here. The State owns very little of the territory alleged to be affected, and the damage to it capable of estimate in money, possibly, at least, is small. This is a suit by a State for an injury to it in its capacity of *quasi*-sovereign. In that capacity the State has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain. It has the last word as to whether its mountains shall be stripped of their forests and its inhabitants shall breathe pure air. It might have to pay individuals before it could utter that word, but with it remains the final power. The alleged damage to the State as a private owner is merely a makeweight, and we may lay on one side the dispute as to whether the destruction of forests has led to the gullying of its roads."
>
> *Georgia vs. Tennessee Copper Co.*, 206 U. S. 230, 237.

The case last above was cited and the principle applied by this Court to rights in water in the case of Kansas vs. Colorado, 206 U. S. 46, 99, where this Court said:

> "It is the State of Kansas which involves the action of this Court, charging that through the action of Colorado a large portion of its territory is threatened with disaster. In this respect it is in no manner evading the provisions of the Eleventh Amendment to the Federal Constitution. It is not acting directly and solely for the benefit of any individual citizen to protect his riparian rights. *Beyond its property rights it has an interest as a State in this large tract of land bordering on the Arkansas River.* Its prosperity affects the general welfare of the State. *The controversy rises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint.*"

The exact nature and limits of the rights of the State as distinguished from the rights of private parties is not disclosed in either of the cases last above.

Certain indications of those limits are disclosed in the case of Kansas vs. Colorado where this Court said:

> "It is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes."
>
> 206 U. S. 117.

In still another case this Court, referring to such rights of a State, said *arguendo*:

> "These rights may vary according to the system of law required by natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older States. See New York vs. Pine, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper State, at least in the watershed of the stream, where irrigation is the condition of using the land. See Kansas vs. Colorado, 206 U. S. 46, 100-104, 117."
>
> *Rickey Land & Cattle Co. vs. Miller & Lux*, 218 U. S. 258.

Likewise *arguendo* this Court in speaking of water rights in another case used this language:

> "We know of no reason to doubt, and we assume, that, subject to such rights as the lower State might be decided by this Court to have, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that State. Kansas vs. Colorado, 206 U. S. 46, 93-95. Therefore, subject to the same qualifications, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521. Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 260. But with regard to such rights as came into question in the older States, we believe that it always was assumed, in the absence of legislation to the contrary, that

the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the State that could be acquired from within. Mannville Co. vs. Worcester, 138 Massachusetts, 89. Thayer vs. Brooks, 17 Ohio, 489. Slack vs. Walcott, 3 Mason, 508, 516. Stillman vs. White Rock Manuf. Co., 3 Woodb. & M. 538. Rundle vs. Delaware & Raritan Canal Co., 1 Wall. Jr. 275, 14 How. 80. Foot vs. Edwards, 2 Blatchf. 310. See Wooster vs. Great Falls Manuf. Co., 39 Maine, 246, 253; Armendiaz vs. Stillman, 54 Texas, 623; State vs. Lord, 16 N. H. 357. Howard vs. Ingersoll, 17 Alabama, 780, 793."

Bean vs. Morris, 221 U. S. 485.

In 3 Kinney on Irrigation (2nd Ed.) Sec. 1225, page 2216, that learned author has this to say:

"The rights of the respective States and of the citizens thereof in and to the use of waters of an interstate stream depend somewhat upon the laws of those States governing waters. If the common law is the only law of waters governing two adjoining States through which an interstate river flows, or if both States have adopted the Arid Region Doctrine of appropriation, the right to the use of the waters of an interstate stream is not affected by the boundary line which divides the States. But where there is conflict of the laws relative to the subject of water, that is to say, the lower State upon the stream having only the common law of riparian rights, and the upper State having adopted the Arid Region Doctrine of appropriation, the rule is different, and will be discussed in a subsequent section of this chapter."

The learned author quoted above refers to Section 1227 of the same Chapter for the promised discussion. In that Section he says:

"The equitable division of the waters of interstate streams between the States through which or adjoining which such streams flow being the rule of law adopted by the Supreme Court of the United States as governing the subject, in what that Court terms the 'practically building up what may not be improperly called interstate common law', as discussed in the preceding sections, it must therefore follow that this rule is not affected by the conflict of the laws of the respective States governing the waters flowing within their respective jurisdictions. Although each State has the power to adopt such laws as it sees fit to govern the waters within its own territory, no State has the power to enact such laws for another State. As said by Mr. Justice Brewer in rendering the opinion of the unanimous Court in the Kansas-Colorado case: 'Neither State can legislate for nor impose its own policy upon the other.' So, as far as this rule of equitable division of the waters of an interstate stream is concerned, it makes no difference as to whether or not one of the States has utterly repudiated the common law of riparian rights and adopted the Arid Region Doctrine of appropriation and another State relies wholly upon the common law of riparian rights. The rule of equitable division between the two States must prevail in any event. This rule of law is illustrated by the Kansas-Colorado case, where the Arkansas River takes its rise in the mountains of Colorado, where the rule of law governing the waters of the State is that of the Arid Region Doctrine of appropriation only, and where the stream flows into the State of Kansas, where it was contended that the prevailing rule of law was the common law doctrine of riparian rights, but which State, in fact, had both systems of laws governing waters.

"Again, the rule is illustrated in the case of Anderson vs. Bassman, where the stream in question takes its rise in the high Sierras in California,

which State has both rules of law governing its waters, the doctrine of appropriation and the common law of riparian rights, and where the stream flows into the State of Nevada, which State has utterly repudiated the common law of riparian rights and has adopted the Arid Region Doctrine of appropriation as its only rule of law governing the waters flowing within its boundaries.

"Neither does the fact that one of the States has dedicated all the waters flowing within its boundaries, either by constitutional provisions or by statutory enactment, to the State and to its citizens affect the right of the division of the waters of interstate streams upon an equitable basis. As was stated by Judge Hallett in the case of Hoge vs. Eaton: 'The idea of an exclusive right in the people of a State to divert its running waters, to the injury of riparian owners in another State, must be equally untenable. Indeed, the doctrine of riparian ownership and the use of running water is not subject to political boundaries. Between hostile States the doctrine may not be recognized, but any such repudiation would be simply *vis major*. Between States dwelling in peace and concord, as are the States of our Union, the equal right of the inhabitants of each State must always be recognized.' "

3 Kinney on Irrigation, Page 2220, Sec. 1227.

Again in Section 1230 that author has this to say:

"The equitable division of the waters of interstate streams between the respective States through or by which they flow involves no question of international law, as is the case of the division of the waters of streams which flow through or bound different independent countries. Under Article I, Section 10 of the Constitution of the United States, it is provided: 'No State shall, without the con-

> sent of Congress, * * * enter into any agreement or compact with another State', etc. Therefore, 'they can not enter upon diplomatic relations, and make treaties.' 'Bound hand and foot by the prohibition of the Constitution, a complaining State can neither treat, agree, nor fight with its adversary, without the consent of Congress.' Therefore, a resort to the judicial power is the only means for adjusting the rights to the waters of interstate streams between the different States entitled thereto. And, again, the idea that there can arise any international question in the case of the use of the waters of an interstate stream by the different States of this country, through which or adjoining which such a stream flows, can not be maintained."
>
> 3 Kinney on Irrigation, Sec. 1230.

The Attorney General of the United States, Judge Harmon, was called upon in 1895 to give an opinion concerning certain complaints made by Mexico against certain diversions of water from tributaries of the Rio Grande which were claimed to reduce the flow of that stream to the injury of Mexican appropriators. The opinion given contains this language:

> "The case presented is a novel one. Whether the circumstances make it possible or proper to take any action from considerations of comity, is a question which does not pertain to this Department; but that question should be decided as one of policy only, because, in my opinion, the rules, principles, and precedents of international law impose no liability or obligation upon the United States."
>
> Opinions of the Attorneys General, Vol. 21, page 274.

If by the word "novel" the Attorney General intended to say that the question was one of first impression, he was apparently, to some extent at least, in error. On June 12, 1880, Mr. Evarts, as Secretary of State, enclosed to the United States Legation in Mexico certain complaints from citizens of Texas living on the Rio Grande. These complaints were to the effect that certain Mexicans in Mexico were in the habit of diverting the waters of the Rio Grande into their ditches, thereby preventing the complainants from obtaining water for the irrigation of their crops.

> "This", said Mr. Evarts, "if true, would be in direct opposition to the recognized rights of riparian owners, and, if persisted in, must result in disaster and ruin to our farming population on the line of the Rio Grande, and might eventually, if not amicably adjusted through the medium of diplomatic intervention, be productive of constant strife and breaches of the peace between the inhabitants of either shore."
>
> 1 Moore's Dig. Int. L. 653.

It is worthy of notice that the complaints made by the Mexican Minister concerning which the opinion of Mr. Attorney General Harmon was written, continued in one form or another for many years after 1895. They resulted in an action brought by the Attorney General of the United States in the District Court of the Third Judicial District of New Mexico against the Rio Grande Dam & Irrigation Company on May 24, 1897. That case reached this Court and is found as United States vs. Rio Grande Dam & Irrigation Company, 174 U. S. 690. The complaint still persisted, and resulted in a special treaty confined to

the distribution of the waters of the Rio Grande. In that treaty between the United States and Mexico, the United States agreed, without expense to Mexico to furnish and deliver to Mexico 60,000 acre feet of water annually. Mexico agreed on its part in consideration of the delivery of the water above stated, to waive any and all claims to the waters of the Rio Grande between the head of the Mexican Canal and Fort Quitman, Texas, and also declared fully settled and disposed of and waived "all claims heretofore asserted or existing, or that may hereafter arise, or be asserted, against the United States on account of any damages alleged to have been sustained by the owners of land in Mexico, by reason of the diversion by citizens of the United States of waters of the Rio Grande." (34 Statutes at Large, Part 3, Page 2953.)

It is true that the United States in that treaty stipulated that it did not concede any basis for the claims asserted by Mexico, nor concede the establishment of any general principle or precedent by the concluding of the treaty.

It is apparent that nothing in any of the quotations or discussions above draws in any clear way the lines bounding the rights of a State as distinguished from those of its citizens in the waters of an interstate stream. Nor is there anything in any clear way marking out the principles upon which equitable division of waters shall be made in such streams. These matters are left to be determined by rules that may be worked out or by analogies from rules governing such matters where the adjoining proprietors instead of being States are individuals. Some of the suggestions of this Court, as above indicated, seem to hint that such rules "may be more or less analogous to common law rights between upper and lower proprietors."

A just criticism has often been made on precedents established in interstate relations to the effect that many such precedents are almost solely the result of "*vis major*". It is to be hoped that the tendencies in dealings between States are in the direction of principles of right and justice; in other words, equitable principles. When such principles are sought and applied in international relations, they are found to approximate more and more closely the equitable principles governing relations between individuals.

In the case at bar at least there can be no such thing as *vis major*. The parties to this controversy are not permitted to make war upon one another, nor even to make treaties with one another. Their controversy is, therefore, brought to this Court to be here determined. So far as we can see, the rules of right, justice, equity, in the controversy here, are identical with the rules of right, justice, equity, that would govern between private persons located on this stream.

So far as we can see, if it is equitable that a prior appropriator should have a right prior to the appropriator who comes later to the stream when private persons only are involved, it is also equitable as between States that the State which first appropriates the water shall have a right in the stream superior to the State which comes later. In the case of private persons, as well as in the case of a State, there may be other rights involved than the rights of the parties to the controversy. In the case of litigation between private persons, a Court of Equity will ordinarily require all who are affected by the decree to be pronounced between the parties to be brought into the litigation in order that the rights of all may be determined.

In this case the waters flow naturally into, by and

through many States. The decision here, if final as to other States not parties, might if made in one direction easily affect injuriously many citizens of Nebraska and that State herself. It is perhaps with something of this in view that the Court has directed an appearance by the Attorney General of the United States so that every consideration may be given to all possible interests of all possible persons.

In irrigation litigation the indirect results to others have thus far not persuaded the Courts to require all directly or remotely affected to be made parties to the proceedings, and in the case at bar such a course would be impracticable. But it is clear that not only the direct results but the tendencies of the decision here as affecting not only the parties to this proceeding but others not here made parties should be taken into account.

The Rights of States in Interstate Streams as Analogous to the Rights of Private Owners

If this case is to be ruled by principles of law already discovered and laid down, so far as we have been able to see they are ruled by principles governing between private persons. The precedents as to international rights on international streams are scarcely sufficient upon which to base any rule, and such as they are they are contradictory, even this Government contending now that riparian rights govern as between States when diversions of water were made within the boundaries of a foreign government, and again contending that the foreign government has no right to complain when

diversions were made within the boundaries of this country from an interstate stream, and still later, while in words protesting that it was not doing so, in deeds recognizing the rights of those injured by diversions within our territories from an interstate stream. The only precedents, therefore, from which the principles that must here govern can be deduced, so far as we can see, are the principles discovered and adopted as to rights between private persons.

Applying the principles as they govern between adjoining private proprietors, there are, as we have seen, two general sets of principles, one denominated the riparian rights doctrine, the other denominated the doctrine of prior appropriation.

The Roman law as appears from the Pandects of Justinian adopted the principles of riparian rights and apparently allowed something in the way of irrigation and of equitable division of waters for that purpose. The same is true of the Code Napoleon, Article 644. This was true likewise of the Mexican law at the time of the acquisition of our Mexican territory, including Colorado and large parts of Wyoming. (1 Wiel on Water Rights, 68, 685, 1026.) But in all these jurisdictions, while water was to an extent used for irrigation, riparian rights were held superior to rights for irrigation.

It is needless to cite authority to show that in Great Britain and in most of the States of the Union, while there has been some limited right to use water more or less for irrigation purposes, still the rights of the riparian proprietor are superior. In all the jurisdictions above mentioned, the riparian proprietor had the right to insist that the use of water should not unreasonably reduce the flow of the stream, should be

confined within the watershed, and that the surplus should always be returned to the stream.

There are eighteen of the States and territories of the United States which may be denominated generally the irrigation States, inasmuch as in each of these eighteen States there is more or less of arid land requiring irrigation, and the laws of these States recognize more or less irrigation rights. These are Alaska, Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, New Mexico, Nevada, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington and Wyoming. In ten of these States and territories, namely, Alaska, California, Kansas, Montana, North Dakota, Oklahoma, Oregon, South Dakota, Texas and Washington, while the use of waters of streams for irrigation is permitted, the riparian proprietor is recognized as having the superior right and the waters are not permitted to be diverted by the irrigators beyond the watershed, but the surplus must be returned to the original stream.

Watkins Land Co. vs. Clements, 98 Tex. Civ. *App.* 578.

Matagorda Canal Co. vs. Markham Irr. Co.,
. . . . Tex. Civ. App. . . . . , 154 S. W. 1176.

In the other seven irrigating States, viz., Arizona, Colorado, Idaho, New Mexico, Nevada, Utah and Wyoming, fuller rights of appropriation are recognized, and apparently the right is recognized to take water outside the watershed, even over the objections of those within the watershed. *But in neither of these States is any diversion from the watershed permitted on any principle of equitable division even remotely expressed or implied.* On the contrary each of these States insists upon the doctrine which we have discussed elsewhere, that the rights of a prior appropriator are exclusive, even to the full extent of his prior appropriation. No division of the waters which would take anything from the prior appropriator to his injury is recognized as in any sense equitable.

This Court in the case of Kansas vs. Colorado, reached a conclusion that on the facts in that case equitable division of the waters was a reasonable principle as between adjoining States on an interstate stream. As we understand that case, this principle of equitable division was not evolved as a new principle but was a mere application of the doctrine of equitable division as between private riparian owners. No rules for equitable division were laid down in that case, nor were any such rules even discussed excepting by a reference to rules of division between riparian owners. This, we think, is made clear by the language of the opinion in that case. The Court said:

"And here we must notice the local law of Kansas as declared by its Supreme Court, premis-

ing that the views expressed in this opinion are to be confined to a case in which the facts and the local law of the two States are as here disclosed. In Clark vs. Allaman, 71 Kansas, 206, is an exhaustive discussion of the question, Mr. Justice Burch delivering the unanimous opinion of the court. In the syllabus, which by statute (Compiled Laws, Kansas, p. 317, sec. 14) is prepared by the justice writing the opinion, and states the law of the case, are these paragraphs:

" 'The use of the water of a running stream for irrigation, after its primary uses for quenching thirst and other domestic requirements have been subserved, is one of the common law rights of a riparian proprietor.

" 'The use of water by a riparian proprietor for irrigation purposes must be reasonable under all the circumstances, and the right must be exercised with due regard to the equal right of every other riparian owner along the course of the stream.

" 'A diminution of the flow of water over riparian land caused by its use for irrigation purposes by upper riparian proprietors occasions no injury for which damages may be allowed unless it results in subtracting from the value of the land by interfering with the reasonable uses of the water which the landowner is able to enjoy.

" 'In determining the quantity of land tributary to and lying along a stream which a single proprietor may irrigate the principle of equality of right with others should control, irrespective of the accidental matter of governmental subdivisions of the land.'

"And in the opinion, on pages 242, 243, are quoted these observations of Chief Justice Shaw in the case of Elliott vs. Fitchburg Railroad Company, 10 Cush. 191, 193, 196:

" 'The right to flowing water is now well settled to be a right incident to property in the land; it is a right *publici juris*, of such a character that whilst it is common and equal to all, through whose land it runs, and no one can obstruct or divert it, yet, as one of the beneficial gifts of Providence, each proprietor has a right to a just and reasonable use of it, as it passes through his land; and so long as it is not wholly obstructed or diverted, or no larger appropriation of the water running through it is made than a just and reasonable use, it cannot be said to be wrongful or injurious to a proprietor lower down. What is such a just and reasonable use, may often be a difficult question, depending on various circumstances. To take a quantity of water from a large running stream for agriculture or manufacturing purposes, would cause no sensible or practicable diminution of the benefit, to the prejudice of a lower proprietor; whereas, taking the same quantity from a small running brook passing through many farms, would be of great and manifest injury to those below, who need it for domestic supply or watering cattle; and therefore it would be an unreasonable use of the water, and an action would lie in the latter case and not in the former. It is, therefore, to a considerable extent a question of degree; still, the rule is the same, that each proprietor has a right to a reasonable use of it, for his own benefit, for domestic use, and for manufacturing and agricultural purposes. * * *

" 'That a portion of the water of a stream may be used for the purpose of irrigating land, we think is well established as one of the rights of the proprietors of the soil along or through which it passes. Yet a proprietor cannot under color of that right, or for the actual purpose of irrigating his own land, wholly abstract or divert the watercourse, or take such an unreasonable quantity of water, or make such unreasonable use of it, as

to deprive other proprietors of the substantial benefits which they might derive from it, if not diverted or used unreasonably. * * *

" 'This rule, that no riparian proprietor can wholly abstract or divert a watercourse, by which it would cease to be a running stream, or use it unreasonably in its passage, and thereby deprive a lower proprietor of a quality of his property, deemed in law incidental and beneficial, necessarily flows from the principle that the right to the reasonable and beneficial use of a running stream is common to all the riparian proprietors, and so, each is bound so to use his common right, as not essentially to prevent or interfere with an equally beneficial enjoyment of the common right, by all the proprietors. * * *

" 'The right to the use of flowing water is *publici juris*, and common to all the riparian proprietors; it is not an absolute and exclusive right to all the water flowing past their land, so that any obstruction would give a cause of action; but it is a right to the flow and enjoyment of the water, subject to a similar right in all the proprietors, to the reasonable enjoyment of the same gift of Providence. It is, therefore, only for an abstraction and deprivation of this common benefit, or for an unreasonable and unauthorized use of it, that an action will lie.'

"As Kansas thus recognizes the right of appropriating the waters of a stream for the purposes of irrigation, subject to the condition of an equitable division between the riparian proprietors, she cannot complain if the same rule is administered between herself and a sister State."

Kansas vs. Colorado, 206 U. S. 46, 102.

In the case last above cited, the equitable division was all within the watershed. No question arose there

of permitting such division as would carry waters without the watershed. One would search in vain for any doctrine of equitable division of waters which would permit one proprietor to carry the waters without the watershed with no obligation to return them to the stream in any State or country administering the rule of riparian rights. In the seven States, possibly the most arid, as we have seen, no doctrine of equitable division of the waters is allowed. The matter rests solely upon prior appropriation and he who first appropriates may use the water to the extent of his appropriation even though later appropriators obtain nothing from the stream. Nowhere, therefore, do we find any rule of equitable division allowing the waters to be taken from the watershed, with no obligation to return them to the stream.

It is interesting, moreover, to note that there are at least tendencies in some of these States constituting the seven last above mentioned, to recognize rights of owners along the stream and to restrict the diversion beyond the watershed. For instance in the Session Laws of Nevada of 1907, Chapter 18, Section 4, page 31, the following provision was put into statute law of the State of Nevada:

> "No person shall be permitted to divert or use any more of the waters of a natural water course or natural lake than sufficient when properly and economically used to answer the purpose for which the diversion is made; nor shall any person be permitted to waste any such water and all surface water remaining after use, unavoidable wastage excepted, shall be returned to the channel by the persons diverting the same, without unreasonable delay or detention."

In the Session Laws of New Mexico 1907, Chapter 49, Section 72, page 95, (New Mexico Statutes Ann. 1915, Section 5718) occurs the following provision:

> "It shall hereafter be unlawful for any person, company or corporation to divert the waters of any public stream in New Mexico for use for reservoirs or other purposes in a valley other than that of any such stream to the impairment of valid and subsisting prior appropriations of such waters."

In the case of Hutchison vs. Watson Slough Ditch Co., Limited, *et al.*, 16 Ida. 484, (101 Pac. 1059), the Court first recognizes the principle that in that State the rights of a riparian proprietor are inferior to the rights of an appropriator, but nevertheless recognizes substantial rights such as must be appropriately guarded and protected by the courts in riparian proprietors as such.

And in the case of Anderson vs. Bassman, 140 Fed. 14, decided by Circuit Judge Morrow, sitting in the Circuit Court, that learned Judge used these words:

> "The decree will also restrict defendants, whether riparian or nonriparian owners, on and after June 1, 1906, from using water from the river where no provision is made for returning surplus water to the river."
>
> (140 Fed. on page 29.)

This language is significant when it is remembered that the stream was an interstate stream; that the lands irrigated by some of the parties to the suit were lands in Nevada, the water being taken from the stream in that State, and that lands of other parties

were in California, the water being taken from the stream in that State.

The effect of the claim of Colorado in this case is therefore a contention for a new principle of law antagonistic to the judgment of mankind from the beginning of history to this day. We submit that there is no right to any equitable division of the waters such as will permit Colorado to take the waters of the Laramie River in the manner here threatened.

C.

Does Colorado have the Right as a Sovereign State to take all Waters found within her Boundaries and use them as she will, Regardless of the Injuries thereby Inflicted upon Others?

This Court has in many cases considered the rights of States as against one another. Missouri vs. Illinois *et al.*, 180 U. S., 208; Georgia vs. Tennessee Copper Company, 206 U. S., 230; Kansas vs. Colorado, 185 U. S., 125; 206 U. S., 46, and cases cited by these. It is clearly established by this Court that a State does not have a right to do acts within its own borders which shall affirmatively cause injury in another State. In the Georgia case the defendant was enjoined from so polluting the atmosphere in Tennessee as to cause damage in Georgia. In the case of Missouri vs. Illinois, while no decree was rendered the case was considered by this Court on its merits in such way as conceded that the pollution of the waters of the river by the State of Illinois so as to cause damage to Missouri

and its citizens, would give a right of action in this Court to the State of Missouri. In the case of Kansas vs. Colorado as reported in the 185 U. S., the demurrer was over-ruled, necessarily holding as it seems to us that a right of action could exist in favor of Kansas against Colorado for diverting the waters of the Arkansas within the boundaries of Colorado in such way as to prevent those waters from flowing down into Kansas. And in the final decision of the case of Kansas vs. Colorado this Court in terms announced the principle that the depletion of the waters could be carried so far that Kansas might "rightfully call for relief against the action of Colorado, its corporations and citizens, in appropriating the waters of the Arkansas for irrigating purposes."

On the whole we deem the question of the sovereign right of Colorado to take the waters as she will, one so fully settled by this Court even if the principle claimed by Colorado were much better founded in reason, that we feel it unnecessary further to discuss it.

We submit:

First, that the proof is clear in favor of Wyoming showing prior appropriations of all the waters of the stream. The proof is especially clear showing that the stream does not furnish sufficient water for the Wyoming irrigators during the irrigation season in most years, and therefore that Wyoming is entitled to ask injunctive relief against Colorado for the threatened diversion, which, as we believe the evidence shows, would clearly cause irreparable injury and damage in the destruction of prosperous communities and enterprises within the State of Wyoming.

Second, That there is not here any right in Colorado to a so-called equitable division of the waters for the purpose of the diversion threatened because (a), the threatened diversion interfering as it does with the Wyoming prior appropriators and depriving them of necessary water is contrary to every principle of prior appropriation; (b), the diversion threatened taking the water as it does from the watershed so that it cannot return to the stream is contrary to every principle and doctrine of riparian rights; (c), that there is no rule or principle governing the depletion of streams *in invitum* excepting the doctrines and principles of prior appropriation and the doctrines and principles of riparian rights and combinations of these two, and nowhere do such principles permit equitable division of water outside the watershed so as to take it away at the same time from prior appropriators and from riparian owners.

Third, That no rule of sovereign rights exists as claimed by Colorado permitting her to take and use the waters as she will, regardless of others.

Fourth, That Wyoming is entitled to the injunction prayed for.

Respectfully submitted,

DOUGLAS A. PRESTON,

Attorney General of the State of Wyoming and Solicitor and of Counsel for the Plaintiff.

THE STATE OF WYOMING,
Complainant,
vs.
THE STATE OF COLORADO, The Greeley-Poudre Irrigation District, a municipal corporation, The Laramie Poudre Reservoirs and Irrigation Company, a corporation,
Defendants.

IN EQUITY

BRIEF OF COMPLAINANT ON DEMURRER

I.

STATEMENT OF THE CASE

This is a suit by the State of Wyoming against the State of Colorado and two individual defendants, growing out of questions of the use of water from an interstate stream, the Laramie River.

The Bill alleges that in 1865 the settlement of the valley of the Laramie in Wyoming began, and

from that time on to the time of the commencement of the wrongs complained of the settlers in the valley of the Laramie in Wyoming had improved and by the practice of irrigation had rendered highly productive the lands in that valley in Wyoming, and had built up there a community of twenty thousand people, irrigating three hundred and twenty-five thousand acres of land.

It is alleged that these lands without the artificial irrigation are so arid in character that they are unproductive; that the citizens of the plaintiff had built the City of Laramie within the valley of the stream, and the plaintiff had established there its State University; and the community, the City, the University, the real values of the lands, are all dependent upon the use of the waters in controversy; that by the practice of irrigation the lands within the valley have become worth a large amount, to-wit, more than ten millions of dollars.

The Bill alleges that it has become established by the customs, laws and decisions of both Colorado and Wyoming that the waters of all streams are open for appropriation and use for irrigation purposes; that priority of appropriation gives priority of right; that neither the point of diversion nor the place nor kind of use of any appropriation or any water appropriated

may be changed to the injury of any other appropriator.

The Bill further alleges that the mountains at the head of the Laramie River where very heavy banks of snow fall in winter are within the State of Colorado, and that it is these heavy banks of snow in Colorado which supply the waters of the stream, the valley of the Laramie in Wyoming being arid and furnishing little water.

It is further alleged that notwithstanding the prior appropriation of the water by citizens of Wyoming, the defendants are threatening to pierce the walls of the water shed by a tunnel through the mountains, and to carry away the waters of the stream to the amount of more than one hundred thousand acre feet per annum, (an acre foot being such amount of water as will cover one acre of ground to a depth of one foot), to a point more than one hundred miles away from the Laramie valley and from which no part of the waters can return.

It is further alleged that if this threat is carried out, it will destroy the value of the lands within the watershed of the Laramie River in the State of Wyoming, and will destroy the community which has been built up there. These matters are confessed by a demurrer to the Bill, the demurrer claiming that these facts do not authorize any relief.

II.

BRIEF OF THE ARGUMENT

1. THE CONTROVERSY IS ONE OF JUSTICIABLE NATURE.

The admission by the demurrer is that the State of Colorado, directly and through her agencies the other defendants, is threatening and intending to divert the waters of the Laramie River in such way as to prevent the waters so diverted from reaching the State of Wyoming, and that such diversion will practically render valueless 325,000 acres of lands which through the use of said waters in irrigation have become of the value of more than ten million dollars, and have been made to support a community of more than twenty thousand people.

That the matter so confessed is one of a justiciable nature is made entirely clear by the opinions of this court in Kansas v. Colorado, 185 U. S. 125, and 206 U. S. 46, and the complainant may maintain the action on its own behalf and also "as *parens patriae*, trustee, guardian or representative" of the considerable portion of its citizens whose property is threatened with destruction and whose health and comfort are threatened with serious injury.

2. THE RELATIVE RIGHTS TO THE WATER.

Stated briefly, counsel for the defendants claim that there are three separate doctrines under which the rights of the parties are to be viewed, as follows:

First. It is said that there is one doctrine under which Colorado as a sovereign State might claim ownership and title to all waters within that State, and the full right to use all such waters regardless of the rights of neighboring States and regardless of injuries that might be thereby occasioned to neighboring States.

Second. It is said that there is another doctrine under which Colorado might use the waters within that State, but not in such way as to diminish unreasonably the resources of Wyoming.

Third. The third doctrine, as suggested by counsel, is the doctrine of prior appropriation under which he who first appropriates water from a particular stream is prior in right regardless of State lines.

From our standpoint a discussion of the first and third doctrines stated by counsel must merge into a single discussion.

(a) COLORADO MUST RESPECT PRIOR APPROPRIATIONS.

Counsel argue for the doctrine of State ownership. The claim is that Colorado owns the waters of the

State; that she has the "paramount right to the exclusive use of all waters of her natural streams"; that she "has the right to control the waters of the non-navigable streams of the State without interference by any other State"; that the "entire flow of the water within the State is impressed with the public use for the benefit of the State and the people thereof"; that her statutes contemplate "the appropriation of all the waters flowing in Colorado for use on lands in Colorado."

For this argument and contention, counsel cite Article 16, Section 5 of the Colorado Constitution and the following decisions of the Colorado Courts, viz.: Wheeler v. Northern Colorado Irri. Co., 10 Colo. 587; Wyatt v. Larimer-Weld Irri. Co., 1 Colo. App. 480, and Lampson v. Vailes, 27 Colo. 201; and in the same connection counsel cite Article 1, Section 31, and Article 8, Section 1 of the Wyoming Constitution, and Turley, et al. v. Furman, et al. (N. M.) 114 Pac. 278.

The Colorado Cases Do Not Support Defendants Here.

Let us first consider the Colorado decisions under her constitution.

Sec. 5 of Article XVI of the Colorado Constitution is as follows:

"Water Public Property—The water of every natural stream not heretofore appropriated, within the state of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided."

Sec. 6 of the same Article is as follows:

"The right to divert unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes."

In the case of *Wheeler v. Northern Colorado Irrigation Co., supra*, cited by counsel, no question arose as between use of waters within the State and their use without the State, nor did the Court even by way of discussion or *obiter dicta* refer to any such question. To be exact, the language used by the Court is as follows:

"Our Constitution dedicates all unappropriated water in the natural streams of the State 'to the use of the people', the ownership thereof being vested in 'the public' ".

In other words, the Court in that case quoted from the Constitution, and did practically nothing in the way of construing it.

The case of *Wyatt v. Larimer-Weld Irrigation Company, supra*, cited by counsel, is similar. There was nothing in the facts in that case which could raise any question of priorities depending upon use within as against use without the State, nor was there any attempt to raise or pass upon any such question. The opinion of the Court, however, quoted the State Constitution, and by way of quotation gave definitions of the words "public" and "people" as contained in Section 5 of Article 16 of that instrument. In speaking further of the Section and its effect upon rights, the Court used this language:

> "The offices to be performed by a constitution are two: First, it is declaratory of the rights inherent in the people, exercised by them, and existing long before its adoption; second, it is a limitation upon all legislative power, preventing any subsequent interference with the declared rights, and perpetuating them. 'Written constitutions sanctify and confirm great principles, but the latter are prior in existence to the former.'
>
> * * * * * * * * *
>
> The history of water rights in this state will show that the rights and principles declared in the constitution were recognized and acted upon by the people years before they were formulated,

and declared in that instrument; that such rights had their inception in the earliest attempt at agriculture, when it was found that climatic conditions demanded the artificial use of water to produce crops. The title of the public and the people to the water in the streams, and the right to divert and appropriate, were recognized and acted upon, the only requirement being an application to a beneficial use; and such rights to the use of water, as between different consumers or users, were established upon the broad equitable basis that preferences were to be controlled by the respective dates when the conflicting appropriations were made. When thus appropriated, the party appropriating was regarded as having a proprietary interest,—a right of property in, and the title to, the water appropriated and diverted, with the right to use, sell, or loan it, like other property. By such appropriation, and by reason of the diversion and separation of the water from the volume of the stream, the title of the public or people was divested, and the appropriator became the owner. Cleared of all embarrassment, by reason of the supposed double ownership, we find the rights declared in the constitution to be the same that were recognized and acted upon by the people before its adoption."

It is evident that the Supreme Court of Colorado in the language just quoted did not attempt to hold that the Constitution enacted a new principle by way of legislation, or otherwise, or declared a new doctrine. On the contrary the holding is that the Constitution

merely declares the old principles long recognized and exactly as recognized, viz., that water is subject to appropriation, that priority of appropriation gives priority of right, and that the appropriator obtains by his appropriation "a proprietary interest,—a right of property in, and the title to, the water appropriated." The Court does not declare in that case that the owners of the lands within the State are the elect, and that the rest of the world is without rights. It does not discuss the question of the effect of State lines on water rights, *but it does very significantly hold that the Constitution is not an enactment, and declares no new doctrine, establishes no new right.* It is needless to say that this construction is reasonable, and that this Court will not reverse the construction given by the Supreme Court of Colorado. The Constitution, therefore, leaves the question of the rights as between lands in the State and lands without exactly as it was before the Constitution was adopted. In other words, it leaves it to the customs and usages of the region.

Counsel are no more fortunate in the case of *Lampson v. Vailes, supra*, which they cite. In that case the Supreme Court of Colorado state the question before it and its decision, as follows:

> "The legal questions discussed are: First. Can water be appropriated by diversion in Colo-

rado for use in New Mexico? In other words, may one owning land in the territory of New Mexico, whether he be a citizen of the State of Colorado or of some other state or territory of the Union, make a diversion in this state from the waters of a nonnavigable stream, and convey the same into the territory of New Mexico for the irrigation of lands therein? Second. Has the district court of La Plata County, under the so-called 'Irrigation Statutes', jurisdiction in the statutory proceeding to award priorities to a ditch which, though having its headgate in this state, was intended to, and does, carry water outside of this state, and into the territory of New Mexico, for the irrigation of lands there?

The first is a very important question, and one which, so far as we are advised, has not been passed upon by a court of last resort, though it is claimed that, in principle, the decision in Howell v. Johnson (C. C.) 89 Fed. 556, is authority for the contention. Certain it is that it is a case of first impression in this jurisdiction. In the view we take of the second legal proposition, it is not necessary to a decision of this appeal to determine the first."

Having thus refused to rule upon the general question like the one at bar, the court disposes of the other question (viz. the jurisdiction of the district under the statutory proceeding), as follows:

"It is clear that the court below, in deciding that it had not jurisdiction to award a priority

to the ditch of appellants for the irrigation of lands in New Mexico, but only to the extent that the appropriation was made for lands in Colorado, was right under the statutes governing this special proceeding. The appellants contend that sections 2399, 2403, Mills' Ann. St. (Gen. St. 1883, sections 1762, 1766), contemplate an adjudication for settling the priority of rights for irrigation for all ditches whose points of diversion are within the state, even though the lands to be irrigated are, in whole or in part, beyond its territorial limits. These sections provide for an adjudication of priorities for ditches drawing water for irrigation from the same stream or its tributaries within the same water districts. If driven to that extremity, it would not be difficult, from the language used, to demonstrate that the adjudication was limited to ditches, etc., used for irrigating lands in this state only, though the language does not in terms so provide. We do not, however, rest our conclusion solely upon the language of these sections. We cannot presume that the general assembly intended to enact a law to operate beyond the territorial limits of the state. The distinction sought to be made by appellants, that the point of diversion of the ditch is the sole factor determining the jurisdiction of the court, is not good. The statutes under which this proceeding was instituted—those creating the various water districts, and our entire irrigation law—must be taken together, and, if possible, the different provisions so interpreted as to give effect to all, and make them harmonious, the one with the other. It is not to be supposed that the state was legislating

for the reclamation or irrigation of lands beyond its boundaries, or making provisions, by the way of police regulations (which we have held these statutes, in some measure, to be), over a territory beyond its jurisdiction.

The different acts establishing water districts (1 Mills' Ann. St. sec. 2310 et seq.; Gen. St. 1883, Sec. 1741 et seq.) either in terms declare, or by implication assume, that these districts are restricted to lands within the State; and the particular act creating district No. 33, the one in question, is 'that district number thirty-three shall consist of all lands lying in the state of Colorado irrigated from ditches or canals, taking water from the La Plata river, and its tributaries, which lie in Colorado.' 1 Mills' Ann. St. sec. 2344 (Sess. Laws 1885, p. 259, sec. 26). The earliest territorial acts expressly confine legislation relating to irrigation to lands situate in the territory. 1 Mills' Ann. St. sec. 2256 et seq. (Gen. St. 1883, sec. 1711). From these enactments it is altogether conclusive that in these proceedings, at least, the intention of the general assembly was to limit the adjudication to ditches irrigating lands situate in this state, and not elsewhere.

Such being our conclusion, it is unnecessary, as we have said, to pass upon the other legal proposition pressed upon us."

It will thus be seen that the Court in that case had a question similar to the one at bar, but refused to give any opinion upon it, though citing a case which holds a doctrine contrary to the contention of counsel here.

The case does hold that the "special proceedings" for the adjudication of water rights in force in Colorado which limit themselves to ditches "within the same water district" were in the nature of "police regulations" and not applicable or operative beyond the State lines.

This seems to us a very clear and correct construction of the statutes of Colorado relating to waters. They provide the means of appropriation and the machinery for adjudicating water rights within the state. These statutes are "police regulations", operative only within the state, and hence without extra-territorial effect.

But there is certainly no support here for the contention that these statutes are enactments declaring the waters the exclusive property of Colorado appropriators. So far as the decision goes upon the question it is against any contention that these statutes intend to have any operation either for or against outside appropriators. It shows that the matter within the legislative intent was "police regulation" as between appropriators within the state.

These cases by the Supreme Court of Colorado, therefore, do not decide that appropriators whose lands are beyond the boundaries of the State hold their property right in the water appropriated by a title

in any wise less certain or less sacred than if their lands were within the boundaries of Colorado.

We have, then, the only constitutional provisions of Colorado which are cited by counsel construed by the Supreme Court of that State as not enacting anything new whatever on the subject of rights to water. Moreover the decisions themselves make no attempt to claim for Colorado the exclusive right to the waters within that state which is here claimed in the brief of counsel, and no legislation is cited by counsel which attempts affirmatively to restrict the doctrine of prior right as obtained by prior appropriation to lands within the State as against lands without.

Other Courts.

(1) *The Federal Court in Colorado Holds to The Rule of Prior Appropriation from Interstate Streams.*

We insist that the Supreme Court of Colorado adopts the correct principle when it says that constitutions are not meant to be legislative in character; they are not enactments; they are not the creation of new rights, but merely declare rights as they already exist. If this section of the Constitution be considered in the light of the customs of the region in relation to waters and their appropriation, the matter would

not seem to be difficult. The result reached in the case of *Hoge v. Eaton, et al.*, 135 Fed. 411, 414, would seem to be the natural result. In that case the question here was brought for decision to the United States District Judge for the District of Colorado while sitting in Circuit within that State. It is worthy of remark that the particular Judge who sat in that case was on the Supreme Bench of Colorado before the admission of that State into the Union and became United States District Judge upon the admission. He therefore must be presumed to have been familiar with the legal history of that State when in 1905 the question was brought before him in the case last cited. In that case the Court, sitting as we have said in Colorado, used this language:

> "We had occasion recently to consider whether the right of a citizen to use water within the state for irrigation of lands is granted by the state or general government, and we were unable to discover any principle of that kind. Mohl v. Lamar Canal Co. (C. C.) 128 Fed. 776. The idea of an exclusive right in the people of a state to divert its running waters to the injury of riparian owners in another state must be equally untenable. Indeed, the doctrine of riparian ownership and use of running water is not subject to political boundaries. Between hostile states the doctrine may not be recognized, but any such repudiation would be simple *vis major*. Between states dwelling in

peace and concord, as are the states of our Union, the equal right of the inhabitants of each state to the waters of intersecting streams must always be recognized. Water is essential to human life in the same degree as light and air, and no bounds can be set to its use for supplying the natural wants of men other than the mighty barriers which the Creator has made on the face of the earth.

* * * * * * * *

It is enough that complainants and their grantors were in the possession and enjoyment of the water a long time prior to respondents' diversion, and therefore the first appropriators under the law of the land as understood in Wyoming and Colorado."

This case was reversed by the Court of Appeals (*Eaton v. Hoge*, 141 Fed. 64) but the reversal was upon another point and should not weaken the case as authority upon the point here under discussion. The decision of the Court, then, in that case is that the citizens of Colorado have no right to waters of an interstate stream already appropriated beyond her borders; that the fact that the prior appropriation is beyond her borders is immaterial.

(2) *The Courts of New Mexico.*

The case from New Mexico (*Turley, et al. v. Furman, supra*), cited by counsel, decides only that the police regulations of that jurisdiction in relation to

water do not operate beyond the boundaries of the State.

(3) *The Wyoming Courts.*

The Constitution of Wyoming is quite similar to that of Colorado. The provisions are these:

> "Water being essential to industrial prosperity, of limited amount, and easy of diversion from its natural channels, its control must be in the state which, in providing for its use, shall equally guard all the various interests involved."
>
> Constitution of Wyoming, Art. I, Sec. 31.

> "The water of all natural streams, springs, lakes or other collections of still water, within the boundaries of the state, are hereby declared to be the property of the state."
>
> Constitution of Wyoming, Art. VIII, Sec. 1.

> "Priority of appropriation for beneficial uses shall give the better right. No appropriation shall be denied except when such denial is demanded by the public interests."
>
> Constitution of Wyoming, Art. VIII, Sec. 3.

The Supreme Court of Wyoming has been called upon to decide the force of these constitutional declarations and of a Wyoming statute containing similar provisions. A case before the Court was one in which an appropriator in Montana from a nonnavigable inter-

state stream sought to have his rights declared superior to those of an appropriator from the same stream for use upon lands in Wyoming. The opinion of the Court upon the point contains the following:

> "This court has stated that the statutory and constitutional declarations seemed rather to declare and confirm a principle already existing than to announce a new one, for the reason that under the rule permitting the acquisition of rights by appropriation the waters become perforce *publici juris.*
>
> * * * * * * * *
>
> The obvious meaning and effect of the expression that the water is the property of the public is that it is the property of the people as a whole. Whatever title, therefore, is held in and to such water resides in the sovereign as representative of the people. The public ownership, if any distinction is material, is rather that of sovereign than proprietor. (Farm Inv. Co. v. Carpenter, supra.) That ownership however, is subject to a particular trust or use, specially defined in the statutes and in the constitution. And that trust or use, in the absence of statute, is just as prominently and intrinsically attached to such public ownership. The waters are held subject to appropriation for beneficial uses. And we have endeavored to show that the right of appropriation is not, in the absence of statute at least, restricted locally nor by state lines. The trust is to be considered as co-extensive with the right on which it rests. Upon the general principles governing

such appropriation, we perceive no reason, if the same be not prohibited by statute, why the owner of lands in another state may not at a point in this State lawfully divert the water of a stream flowing in both states and conduct such water upon his lands for their irrigation, and thereby secure a valid water right. There is nothing in the essential character of the trust or use for which the waters are held by the public that, in our judgment, prevents the acquirement of a water right on such stream in that manner, provided the appropriator is able to comply with the statutory provisions regulating and controlling the appropriation and diversion of the public waters.

Moreover, a desirable comity between the states within whose respective dominions the same stream may flow, and a due regard by each for the rights of the residents and land owners in the adjoining state, would seem to require a liberal view of this matter. In an interesting case in Wisconsin, where the question arose whether the state could constitutionally sell the ice formed upon public waters, it was held that where the term 'people of the state' is used to designate the beneficiaries of the trust in navigable waters, all the people who may choose to enjoy the same within the state are referred to, whether citizens of the state or persons who came within its territory, for the purpose of enjoying such public rights. (Rossmiller v. State, 114 Wis., 169.)"

Willey, et al., v. Decker, et al., 11 Wyo. 496, 533.

Farm Investment Co. v. Carpenter, 9 Wyo. 110.

(4) *The Supreme Court of Idaho.*

The constitution and laws of the State of Idaho contain similar provisions.

"The use of all waters now appropriated, or that may hereafter be appropriated for sale, rental or distribution; also of all water originally appropriated for private use, but which after such appropriation has heretofore been, or may hereafter be sold, rented, or distributed, is hereby declared to be a public use, and subject to the regulation and control of the state in the manner prescribed by law."

Constitution of Idaho, Article 15, Section 1.

"The right to divert and appropriate the unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water."

Constitution of Idaho, Article 15, Section 3.

"The right to the use of any of the public waters of this state may be acquired by appropriation which must be for some useful or beneficial purpose."

Laws of Idaho 1895, page 174, Section 2.

See also Laws of Idaho 1899, page 380, Section 2.

Laws of Idaho 1903, page 223 and following.

In the case of *Taylor v. Hulett*, 15 Ida. 265, the

Supreme Court of that State had before it questions of the relative rights between appropriators in Wyoming and Idaho drawing waters from an interstate stream, and in passing upon those questions the Court uses the following language:

> "It would seem, upon both reason and authority, that the courts of this state, in ascertaining, decreeing, and protecting property rights in water appropriations within the jurisdiction of the state, may at the same time and for that purpose inquire into and determine rights and priorities on the same stream that are located and situated beyond the state line, in order to fairly and finally judicially determine the relative rights of the parties and decree the extent of the title and right of possession of the thing or subject-matter within this jurisdiction. This proposition ought to be accorded a special recognition and application by the courts in water and irrigation litigation. Streams rise in one state and flow into another, irrespective of boundary lines, and still the rules and doctrines of priority of appropriation and use are the same in most of the arid states. This is particularly true with respect to this case. Here the riparian doctrine of the common law has been abrogated in both Idaho and Wyoming, and the rule of 'first in time is first in right' is recognized and enforced in both states. Drake v. Earhart, 2 Idaho, 750, 23 Pac. 541; Moyer v. Preston, 6 Wyo. 308, 44 Pac. 845, 71 Am. St. Rep. 914; Farm Investment Co. v. Carpenter, 9 Wyo. 110, 61 Pac. 258, 50 L. R. A. 747, 87 Am. St. Rep. 918; Willey v. Decker,

supra. The relative rights, therefore, of appropriators of the water of an interstate stream are the same, whether the appropriations are all in the same state, or some in one state and the balance in another state. This proposition is accentuated in a case like this, where the court not only has jurisdiction of the res or subject-matter, but also obtains jurisdiction of the person of the defendant. In the case at bar the diversion by the defendants, being the act that causes the injury, takes place in Wyoming; but the injury itself that flows from the wrongful act takes place in this state. It has long been recognized as a general rule that, where an act is committed in one jurisdiction that occasions injury or damage in another jurisdiction, the injured person may elect to bring his action in either jurisdiction."

(5) *The Supreme Court of Utah.*

Similar provisions are found in statutes enacted by the legislature of Utah.

Statutes of Utah, 1905, Chapter 108, Section 47.
Statutes of Utah 1907, pages 56 and 248.
Compiled Laws of Utah 1907, Section 1288, Clause 18.

The question came up somewhat collaterally in the case of *Conant v. Deep Creek etc. Co.*, 23 Utah 627. The litigation concerned the rights of appropriators taking water from an interstate stream. This question had been adjudicated by the District Court

for Oneida County, Idaho, the stream arising in Idaho and flowing into Utah. In defining the force of the Idaho decision the Supreme Court of Utah in the case above cited uses the following language:

> "It is a recognized rule of law that a person who has appropriated water at a certain point in a stream is entitled to have so much of the waters of said stream as he has appropriated flow down to him to the point of his diversion; and if the settlers higher up on the stream, in another state, whose appropriations are subsequent, divert any of the waters of the stream which have been so first appropriated, then the courts of the latter state will protect the first settler in his rights. Howell v. Johnson (C. C.) 89 Fed. 556. The Idaho courts, therefore, have ample and complete jurisdiction to protect the rights of respondents to have the waters which they have appropriated, and which they divert in Utah, flow through the channel of the stream, and to limit and determine the rights of the Idaho appropriators with reference thereto; and by the decree entered in the suit in the district court of Oneida county, Idaho, such rights were fully protected, and may be enforced by proper proceedings in that court."

(6) *The Federal Courts in the Arid Region Hold against the Defendants.*

The case of *Howell v. Johnson* (*C. C.*) 89 Fed. 556, involved a question between Wyoming lands and

Montana lands, each party claiming appropriations from a nonnavigable interstate stream. The contention was made that the Wyoming citizens owning the Wyoming lands could not maintain the action in Montana because the State of Montana owned the waters in that State. This contention was overruled by the Court, which held that the rights must be determined without reference to State lines.

In the case of *Anderson v. Bassman*, (*C. C.*) 140 Fed. 14, the same question arose between land-owners in Nevada and land-owners in California, each claiming as an appropriator of water from the same non-navigable interstate stream. The Court quotes from the cases of *Howell v. Johnson* and *Hoge v. Eaton*, *supra*, and endorses the views expressed in those cases, saying:

> "This court is in entire accord with the views of these two Courts upon this question."

In the case of *Morris v. Bean*, (*C. C.*) 123 Fed. 618, the Circuit Court for the District of Montana, upon a demurrer, again had before it the relative rights of Wyoming and Montana appropriators from the same interstate stream, and again held that the prior appropriator is protected in his right "as against subsequent appropriators although the latter withdraw the water within the limits of a different state."

The final hearing of the case was in the same Cir-

cuit Court, but before a different Judge. *Morris v. Bean*, 146 Fed. 423.

The contention was again made at the final hearing that an appropriator in Wyoming could not in a court in Montana assert rights as against an appropriator in Montana. The Court overruled this contention, the opinion containing among other things the following:

> "In the early stages of this suit Judge Knowles refused to sustain the views thus presented by the defendants. Whether the ruling made is the law of this case does not become material, because the reasons which actuated him in his decision are not only based upon sound principles, but are sustainable upon authority. No case has been cited where the distinction sought to be drawn has prevailed in the courts, but, on the contrary, apparently, wherever the question has arisen the holding has been the other way."

The case last above cited went to the United States Circuit Court of Appeals for the Ninth Circuit and was there affirmed, the Court saying, among other things:

> "The right to divert or appropriate for a useful purpose the waters of a nonnavigable stream is recognized by the laws of Montana and Wyoming, and by sections 2339 and 2340 of the Revised Statutes (U. S. Comp. St. 1901, p. 1437); and the broad principle which underlies the relative

rights of appropriators from the same stream is, that whoever is first in time is first in right, and the fact that the stream, the waters of which are appropriated, is interstate and nonnavigable, does not affect the rule."

Bean v. Morris, 159 Fed. 651, 655.

The same question arose between appropriators in different States (California and Nevada) in the case of *Miller, et al. v. Rickey, et al.* (*C.C.*) 127 Fed. 573. The Circuit Court held the rights of the parties unaffected by State lines. The case was taken to the Circuit Court of Appeals and there affirmed. The opinion of the Circuit Court of Appeals contains the following:

"The water in the stream, which has a propensity to seek its level, and will continue in its current to the sea, is in strict reality the veritable thing in controversy. It knows not imaginary state or county lines, and is a thing in which no man has a property until captured to be applied to a beneficial use. The right of appropriation is recognized in law, which means the right of diversion and use. It is the right, not to any specific water, but to some definite quantity of that which may at the time be running in the stream. So the right acquired by an appropriation includes the right to have the water flow in the stream to the point of diversion. The fact of a state line intersecting the stream does not,

within itself, impinge upon the right. In other words, the appropriation may still be acquired although the stream is interstate and not local to one state; nor will the mere fact that the stream has its source in one state authorize a diversion of all the water thereof as against an earlier and prior appropriator across the line in another state. On the contrary, one who has acquired a right to the water of a stream by prior appropriation, in accordance with the laws of the state where made, is protected in such right as against subsequent appropriators, though the latter withdraw the water within the limits of a different state."

Rickey Land & Cattle Co. v. Miller, et al., (C. C. A. 9th Cir.) 152 Fed. 11, 17.

So far as we can discover all of the courts of the arid region without any exception, whether state courts or Federal Circuit Courts or Federal Circuit Courts of Appeals, have thus agreed that prior appropriation gives priority of right without regard to State lines. And this ruling has been unaffected by general language in constitutions or statutes to the effect that the waters of streams are "declared to be the property of the state" or "property of the public". Such expressions are held to mean only that the waters are *publici juris*:— the property of the "negative community", in other words, belong to no one, until seized and beneficially used.

These are familiar ideas to all systems of law. The conception is further that he who first beneficially uses—he who first appropriates becomes the owner in the full sense that he thereby acquires a right of property—the right to use as against all others.

1 Wiel on Water Rights, Section 172.

The Decisions of This Court.

The question of the relative rights of two states and their citizens in the waters of a nonnavigable interstate stream in certain of its phases has come before this Court.

In the case of *Kansas v. Colorado*, 185 U. S. 125, and 206 U. S. 46, the question arose between states one of which maintains the doctrine of riparian rights, the other the doctrine of appropriation. The Bill of Complaint in that case is grounded largely on the claim that Kansas has the right to the uninterrupted flow of the river, while "the extreme contention of Colorado is that it has the right to appropriate all the waters of the stream for the purposes of irrigating its soil and making more valuable its own territory".

While it seems to be contended that this Court did not in that case fully or clearly decide upon this "extreme contention" of Colorado—did not in terms decide whether or not Colorado as claimed in that case

and here has the "paramount right to the exclusive use of the water of her natural streams in so far as her necessities require the use of such waters for beneficial purposes within the state", it must be conceded that at the very least this Court in that case *arguendo* takes strong grounds against the doctrine there and here claimed in favor of Colorado. In that case the whole spirit of the decision is against that extreme contention. Besides this general spirit the Court made use of the following language:

> "Colorado could not be upheld in appropriating the entire flow of the Arkansas River, on the ground that it is willing to give, and does give, to Kansas something else which may be considered of equal value." (Page 100.)

And at another place in that case this Court said:

> "At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes." (Page 117).

This language seems to be entirely inconsistent with any view that Colorado by virtue of her sovereignty or of any declaration in her constitution has the

right to the exclusive use of all waters within the State regardless of the effect upon other states or upon the citizens of other states.

The case of *Rickey Land & Cattle Co. v. Miller & Lux*, *supra*, came before this court on certiorari, 218 U. S. 258. This Court affirmed the decree. The opinion contains the following:

> "It is conceivable, to be sure, that the decisions of this court may determine that the States have rights as against each other *in invitum* in streams that flow through the land of both. Kansas v. Colorado, 206 U. S. 46, 84. Missouri v. Illinois, 200 U. S. 496, 519, 520. These rights may vary according to the system of law required by natural conditions. They may be more or less analogous to common law rights between upper and lower proprietors, where irrigation is not necessary, as in most of the older States. See New York v. Pine, 185 U. S. 93, 96. There may be some, perhaps limited, right of appropriation in the upper State, at least in the watershed of the stream, where irrigation is the condition of using the land. See Kansas v. Colorado, 206 U. S. 46, 100-104, 117. But whatever this court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his State, and those rights, the petitioner insists, can, or at least should be, determined only in a suit brought by the State itself.
>
> * * * * * * * * *

> We are of opinion that the petitioner fails to establish the conclusion for which it contends. The alleged rights of Miller and Lux involve a relation between parcels of land that cannot be brought within the same jurisdiction. This relation depends as well upon the permission of the laws of Nevada as upon the compulsion of the laws of California. It is true that the acts necessary to enforce it must be done in California and require the assent of that State so far as this court does not decide that they may be demanded as a consequence of whatever right, if any, it may attribute to Nevada. But, leaving the latter possibility on one side, if California recognizes private rights that cross the border line, the analogies are in favor of allowing them to be enforced within the jurisdiction of either party to the joint arrangement."

Likewise the case of *Bean v. Morris*, *supra*, was brought to this Court upon certiorari, (221 U. S. 485.) The decree as entered by the courts below was likewise affirmed in that case. The Court, among other things, says:

> "We know no reason to doubt, and we assume, that, subject to such rights as the lower State might be decided by this court to have, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that State. Kansas v. Colorado, 206 U. S. 46, 93-95. Therefore, subject to the same qualifi-

cations, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri v. Illinois, 200 U. S. 496, 521. Rickey Land & Cattle Co. v. Miller & Lux, 218 U. S. 258, 260. But with regard to such rights as came into question in the older States, we believe that it always was assumed, in the absence of legislation to the contrary, that the States were willing to ignore boundaries, and allowed the same rights to be acquired from outside the State that could be acquired from within. Manville Co. v. Worcester, 138 Massachusetts, 89. Thayer v. Brooks, 17 Ohio, 489. Slack v. Walcott, 3 Mason, 508, 516. Stillman v. White Rock Manuf. Co., 3 Woodb. & M. 538. Rundle v. Delaware & Raritan Canal Co., 1 Wall. Jr. 275, 14 How. 80. Foot v. Edwards, 2 Blatchf. 310. See Wooster v. Great Falls Manuf. Co., 39 Maine, 246, 253, Armondiaz v. Stillman, 54 Texas, 623; State v. Lord, 16 N. H. 357. Howard v. Ingersoll, 17 Alabama, 780, 793. There is even stronger reason for the same assumption here. Montana cannot be presumed to be intent on suicide, and there are as many if not more cases in which it would lose as there are in which it would gain, if it invoked a trial of strength with its neighbors. In this very instance, as has been said, the Big Horn, after it has received the waters of Sage Creek, flows back into that State. But this is the least consideration. The doctrine of appropriation has prevailed in these regions probably from the first moment that they knew of any

law, and has continued since they became territory of the United States. It was recognized by the statutes of the United States, while Montana and Wyoming were such territory, Rev. Stat., Secs. 2339, 2340, p. 429, Act of March 3, 1877, c. 107, 19 Stat. 377, and is recognized by both States now. Before the state lines were drawn of course the principle prevailed between the lands that were destined to be thus artificially divided. Indeed, Morris had made his appropriation before either State was admitted to the Union. The only reasonable presumption is that the States upon their incorporation continued the system that had prevailed theretofore, and made no changes other than those necessarily implied or expressed. See Willey v. Decker, 11 Wyoming, 496; Smith v. Deniff, 24 Montana, 20."

It does not seem to us that the case of *Hudson Water Company vs. McCarter*, 209 U. S. 349, cited by counsel, has anything contrary to the contentions of complainant here. That case was based largely upon the principles underlying the doctrine of riparian rights. The opinion itself states, "the problems of irrigation have no place here." The attempt which was enjoined in that case was an attempt of a riparian proprietor to divert and take away to a long distance a very substantial portion of the stream. The holding by the State Court was "that a riparian proprietor has no right to divert waters for more than a reasonable

distance from the body of the stream or for other than the well known ordinary uses and that for any purposes in general he is narrowly limited in amount." This statement of the doctrine seems to be concurred in by this court. The case was not one where the state was seeking to divert the water of the stream so as to injure those below, but, on the contrary, the state, in its own right and in the right of the riparian owners below, sought successfully to prevent the diversion of the stream.

APPLYING THE PRINCIPLES MAINTAINED BY THE COURTS.

Both Colorado and Wyoming have held that the doctrine of prior appropriation of waters through the very necessities caused by the arid conditions prevailing, were in force throughout this region long before any constitutional provision was adopted or statute enacted on that question. Both states hold that he who first applies the waters to a beneficial use thereby acquires a property right prior and superior to the rights of all others who may come afterwards to those waters. The laws and customs of the two States concur. The constitutions of the two States contain similar terms upon the question, and the courts of both States hold

that these constitutional provisions enact nothing new but merely declare that which was the rule before. The rule and custom had in the beginning no regard to state boundaries; indeed it was recognized and prevailed when there were no state boundaries. There is no legislation in either state restricting the rights acquired to lands within its own boundaries.

These States touch one another along a line more than two hundred and fifty miles in length. Both States are at the summit of the continent. Across the boundary line between them some of the streams flow southward and some flow northward. Indeed about two-thirds of that line sees its streams arising in Wyoming and flowing southward into Colorado. Along about one-third of the line the streams originate in Colorado and flow into Wyoming. Throughout practically the entire line bounding Wyoming on the East, North and West Wyoming is the upper state. Her mountains and plains gather the water into streams and pour them into the domains of her neighbors. So the plaintiff is not here asking the enforcement of any right which shall work out advantageously to her alone.

For the moment we may waive for the purposes of the argument the question of the extent to which Colorado might go by appropriate legislation in the way of appropriating all of the streams of the State

as she might choose regardless of the destruction thereby wrought in other states. These facts would still remain.

1st. That Colorado has not so legislated.

2nd. That she concurs with Wyoming in the proposition that the very necessities of the region created the principles underlying appropriation which operated throughout the entire region before the States were in being and without regard to state lines.

3rd. That growing out of this absence of legislation coupled with this necessity and the resulting laws and customs, it must be assumed that Colorado has ignored and been willing to ignore boundaries and allow "the same rights to be acquired from outside the state that could be acquired from within".

Upon this assumption plaintiff and her citizens had a right to rely. They began the use of these waters long before there was any state boundary between the lands now in Colorado and those in Wyoming, and have continued till now. They applied these waters to a beneficial use long before any thought of using them came to the defendants. By such use Wyoming and her citizens have built up and are maintaining within the water shed a large and prosperous community. Such a community and the values they have created and are sustaining are substantial and give

substantial rights such as a court of equity will regard even in a contest between states. The defendants seek to destroy this community and these values, not because of any prior use of the water by them, but for the purpose of beginning in the future a new use of these waters. They seek to make fertile in the future lands which are now arid,—to create in the future a community where there is now a desert, but to make fertile this new region and build this new community in Colorado they restore to the desert a region which has already been reclaimed and destroy the community already built up in Wyoming. And this water is to be used by the defendants in the future, not upon riparian lands where some compensating benefit might accrue to the complainant, but entirely outside of the water shed at points so remote and so situated that no part of the water taken can in any way reach or benefit complainant or its citizens.

COLORADO MAY NOT NOW DIVEST COMPLAINANT AND HER CITIZENS OF THESE PROPERTY RIGHTS.

All of these appropriations of water by complainant and her citizens became vested property rights before the diversion charged in the Bill was threatened.

Upon the facts alleged all the courts agree that this result was accomplished. These property rights became so vested at a time when there was neither constitution nor statute of Colorado expressly or otherwise refusing her assent to a rule and principle which had been in operation from the beginning throughout the region with no limitations by artificial boundaries.

Colorado may not now if she would, by any act of her legislature or people, without process of law, take away these vested property rights. Indeed she has not attempted it. Her administrative officers alone without any legislative declaration, are claiming here their right as representatives of Colorado to create the disaster to Complainant and her people. No action of these can operate to overcome the presumption that Colorado concurs with Wyoming in ignoring boundaries, even if such presumption were necessary.

THE GENERAL SOVEREIGN RIGHTS OF COLORADO WITHIN HER OWN BOUNDARIES.

But Counsel quote from the case of Kansas v. Colorado the following:

> "The powers affecting the internal affairs of the States not granted to the United States by the

> Constitution nor prohibited by it to the States are reserved to the States respectively and all powers of a national character which are not delegated to the National Government by the Constitution are reserved to the people of the United States."

In the language above quoted this Court was not speaking of the rights of a state as against its neighbors. The question there discussed grew out of a contention by counsel for the GENERAL GOVERNMENT that in some way a superior right was vested in the United States as a sovereign "to control the whole system of the reclamation of arid lands" as against the states. The language quoted had to do with the powers conferred by the constitution upon the General Government. It had nothing to do with the question how far a state might invade or ignore private rights or the rights of other states.

SOME THINGS FORBIDDEN TO STATES.

It is manifest that there are many things injurious to her neighbors which no state may do even within her own boundaries.

> Missouri v. Illinois, 180 U. S. 208; 200 U. S. 496.
> Kansas v. Colorado, 185 U. S. 125; 206 U. S. 46.
> Rhode Island v. Massachusetts, 12 Peters 720.
> Georgia v. Tennessee Copper Co., 206 U. S. 230.

It is equally clear that general discussions as to the powers granted and powers reserved as between the states and the General Government are of little, if any, service in drawing the line between permitted and prohibited injuries by one state to its neighbor.

Nor is it true that controversies between states must be determined by the rules of strict legal right as distinguished from equitable principles. This court has jurisdiction of controversies between two states, not only such as arise at law but also such as arise in equity.

The plaintiff contends that the defendants are invading her rights. Of course before it arises to such dignity as to require redress here such an invasion must cause substantial injury, and it may be that substantial injury to a state must be weighed on different scales from those used in weighing injuries to individuals. But here the damage threatened we submit is substantial even in a controversy between states, and we submit that the substantial character of the right and damage being as shown, the equities of these states rest largely upon principles similar to those underlying equities between individuals. And in controversies between individuals all the courts of the arid region, State and Federal, unite, as we have seen, in sustaining the equities and redressing the grievances

such as these brought to the attention of this Court.

(b) THE RULE OF EQUITABLE APPORTIONMENT.

Counsel discuss in their brief the rule applied in the case of Kansas v. Colorado allowing to the upper state the right to use the waters of the stream in such way as not unreasonably to diminish the flow reaching the lower state.

It seems to us that this use of the Kansas-Colorado case ignores the caution given by the opinion in that case. The opinion warns that "the views expressed in this opinion are to be confined to a case in which the facts and the local law of the two states are as here disclosed". This warning is coupled with the discussion of the local law as decided by the courts of last resort of the two states. The rule of riparian rights as decided by the Supreme Court of Kansas was by this Court deduced from the opinion in *Clark v. Allaman*, 71 Kansas 206, considered in connection with a quotation therein from observations by Chief Justice Shaw in *Elliott v. Fitchburg Railroad Co.*, 10 Cush. 191. The riparian doctrine as held by Kansas was thus found to recognize "the right of appropriating the waters of a stream for the purposes of irrigation subject to the condition of an equitable division between the riparian proprietors." And this Court after show-

ing that to be the rule in Kansas declares that that state "cannot complain if the same rule is administered between herself and a sister state". Therefore it was that the rule of "equitable division" was adopted in that case. The divergence between the laws of Kansas and those of Colorado left no room to base the decision upon any principle concurred in by both. There was no principle held by Colorado which could be so used as to mete out justice and equity to Kansas with its different rule as to waters. Therefore the Colorado contentions seem to have been rejected. The riparian doctrine as held by Kansas was found to do equity both to Colorado and to Kansas, and therefore that doctrine was adopted.

In the case at bar both states have always held that it is just and right and equitable that the first appropriator shall be protected in his appropriation, that it is inequitable for anyone who afterwards attempts to use any waters of the stream to so use them as to interfere with the full use of the prior appropriator. Colorado has always freely granted equitable relief to protect the prior appropriators against any interference. How can she here complain "if the same rule is administered between herself and a sister state". Colorado when settling controversies between individuals has always insisted not only that this rule is

equitable but that every other rule is inequitable. Why shall she not herself submit to do that which is right? Wyoming has always held to the same rule and could not ask, and does not ask the application of any other rule here.

It seems to us, therefore, that the only rule of "equitable division" which actually does equity between these parties is the rule of prior appropriation.

(3) CERTAIN ANCILLARY QUESTIONS.

We will next discuss certain questions which counsel discuss in their brief and which though material are in relation to matters other than those of first importance on the merits.

(*a*) *The sufficiency of the Bill to show prior appropriation.*

It is claimed by counsel here that the Bill does not state a cause of action under the doctrine of prior appropriation. For this contention they cite the following cases:

Farmers High Line Canal & Reservoir Company, et al. v. Southworth, 13 Colo. 111.
Church v. Stillwell, 12 Colo. App. 43.
Carroll v. Vance, 39 Colo. 216.
Wutchumna Water Co. v. Pogue, 151 Cal. 105.

In each of the cases cited the averment was merely and only that the plaintiff appropriated. No fact was given as to time, or manner, or application to beneficial use. We have no quarrel with the rule as quoted by counsel from one of the Colorado decisions, as follows:

> "In pleading an appropriation, it is necessary to plead the facts which constitute the appropriation."

Nor with that other statement quoted from another Colorado case, as follows:

> "In a suit to determine the priorities of such right, it is not sufficient for the plaintiff to merely allege in his complaint that he has the priority of right. That is a legal conclusion. He must specifically aver all of the substantive facts which are necessary to constitute such priority."

Counsel quoted from a single averment in the Bill here which alleges the extent of the appropriation, viz., that the plaintiff and its citizens had appropriated the waters of the river for the actual irrigation of 325,000 acres of land. The Bill on page 9 alleges that:

> "For many years prior to the commencement of said wrongful acts the lands in Wyoming lying along the said Laramie River and its tributaries and in its drainage basin had been settled, cul-

tivated, improved and rendered highly productive *by the practice of irrigation and the use of the waters of the said Laramie River and its tributaries for the irrigation of the said lands.*"

Here we have the statement of the actual application of the water to the lands by irrigation, which is in itself an appropriation provided such application results beneficially. There is also the averment here that this application of the waters in the way of irrigation was many years prior to the commencement of the wrongful acts of the defendants, so that without stating it as a conclusion of law, the facts are here alleged making the appropriation prior and superior to the appropriation by the defendants, which, as the averment is, began many years later.

On page 15 of the Bill the allegation is made that the use of the waters in irrigation is beneficial, and that the taking away of the waters would be destructive to the values of the lands. The allegation is in these words:

> "And your Orator further avers that without the use of the said waters as aforesaid the lands of your Orator and its citizens within the said water shed within the State of Wyoming would be to a very large extent valueless and incapable of supporting any considerable population, and

that with the use of the said waters as aforesaid, the said lands are very valuable, to-wit, of a value of more than ten million of dollars, and support a large population, to-wit, a population of more than twenty thousand people, and that the wrongs and threatened wrongs of the said defendants as hereinafter set forth if persisted in would render the lands of your Orator and its citizens in the said water shed and drainage basin to a very large extent valueless."

The things necessary to constitute prior appropriation are these three.

1st. The water must have been applied upon the lands.

2nd. The use must have been beneficial.

3rd. This must have been accomplished prior to the application of the same waters by those who are sought to be made junior.

Wiel on Water Rights 3rd Ed. Sec. 365, and cases there cited.

All of these facts which constitute the prior appropriation are alleged in the Bill outside of the paragraph quoted by counsel. Having alleged these facts, it was not improper for the Bill in the paragraph quoted by counsel to draw the legal conclusion that there was

an appropriation and that it was prior to any right in the defendants.

(*b*) *The question as to the place of use.*

For the general purposes of the discussion here at this time we might well waive all contention with counsel in relation to the materiality of the place of use of the water. We might here for the purposes of the argument concede that the rule defining rights between appropriators disregards the place of use and permits water to be diverted from the water shed of one stream to the water shed of another. Even so, this is but a subsidiary rule to the general doctrine of appropriation and is applicable only where the doctrine of appropriation is adopted. This subsidiary rule, moreover, has the following conditions precedent.

First. The new diversion must not injure any prior appropriator.

Atchison v. Peterson, 20 Wallace 507, 514.
Wellington v. Beck, 30 Colo. 409.
Wellington v. Beck, 43 Colo. 70.
Telluride v. Blair, 33 Colo. 353.
Willey v. Decker, 11 Wyo. 496.

Second. If any appropriator would change the place of use of his waters, he may do so only in case he so changes the place of use as not to injure any other appropriator, either prior or subsequent.

New Cache La Poudre Irrigating Co. v. Water Supply & Storage Co., 49 Colo. 1.
Johnston v. Irrigating Co., 13 Wyo. 208, 237.

In this case under the averments of the Bill the diversion is practically a new diversion, and is destructive of the rights of complainant and her citizens who are prior appropriators.

The plaintiff might well complain against new appropriations within the water shed provided those new appropriations became injurious to her rights. But it was found, as the Bill alleges, that so far as water has heretofore been diverted for use in the water shed seventy-five per cent. of it returns to the stream. It was further found that the area within the water shed in Colorado upon which waters might be used, so far as the plaintiff now knows is not great, nor did the plaintiff find any threatened diversion for use within the water shed concerning which she felt it necessary to complain. The whole complaint, therefore, was that the defendants are threatening now to take water in such way as to greatly injure the plaintiff and her citizens, and to interfere with their prior appropriations, and one element in the matter of working injury is the fact that the threatened diversion will take the waters far beyond the water shed so as to increase greatly the injury that would otherwise be sustained.

We respectfully submit that the Bill states a cause of action; that the invasion of the rights of the plaintiff is of such magnitude as to entitle her to relief, and that the demurrer to the Bill should be overruled.

DOUGLAS A. PRESTON,

Attorney General of the State of Wyoming and Solicitor and of Counsel for the Plaintiff.

In the Supreme Court of the United States.

No....., Original.

IN EQUITY.

THE STATE OF WYOMING, COMPLAINANT,

vs.

THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, A MUNICIPAL CORPORATION, THE LARAMIE-POUDRE RESERVOIRS AND IRRIGATION COMPANY, A CORPORATION, DEFENDANTS.

BRIEF OF DEFENDANTS ON DEMURRER.

STATEMENT.

The rapid development of irrigation in that part of the United States formerly known as the Great American Desert has given rise to a variety of perplexing problems. Not that the problems themselves are new, for they are not, any more than irrigation itself is new. From the very beginning of the human race we find evidences that the artificial use of water

for growing crops was one of the first steps taken in the development of civilization. All of the great civilizations in the early history of mankind arose in countries where the rainfall was either so slight or so precarious and uncertain that the artificial application of water to land in order to raise crops was a necessity from the very beginning, and a necessity which constantly grew as the nation and its civilization grew.

Thus, there are innumerable quotations in the Old Testament pointing to a knowledge of irrigation; the laws of King Hammurabi of Babylon, unearthed comparatively recently, contained a complete irrigation code, and we know that irrigation was practiced in the valleys of the Tigris and Euphrates from a very early date. The old Chinese, Indian and Egyptian peoples were irrigators; in later days, both Carthage and Rome diverted water for domestic uses and for irrigation. Ruins of old irrigation systems are found all through northern Africa, in Peru and in Mexico. Irrigation has been practiced in Spain at least since the time of the Moors, and probably before; and in Italy, the valley of the Po has been irrigated since about 1100, there being one irrigation ditch at least still in use which is over 800 years old.

In all of these countries we find the development of irrigation closely paralleling in all essential respects our own development in the western part of this country. The same engineering and hydraulic questions have been met and overcome, and the same difficulty has been experienced in molding laws to fit the constantly increasing use and value of water. Indeed, a striking instance of this has come down to

us from Roman times and has found a permanent place in our language. In old Roman days an artificial water channel, and therefore a ditch, was a *rivus,* and the users from such a water-course were *rivals;* and the word still retains its suggestion of the constant struggle for water which apparently characterized the fellow-irrigators of those days, as it does those of our day.

In tracing the history of irrigation, we find that the first use of water is made by small individual ditches which water the land immediately adjacent to the stream. As civilization progresses and a larger amount of land is to be called into requisition to support the needs of the people, these ditches are extended.

By being taken out farther up the river they can be made to cover more land. This means, of course, a longer ditch and greater expense, and then the element of co-operation enters, and associations, and in later history companies, are formed to construct these ditches and divert the water. As the needs continually increase, the question of storage of flood waters, and of water during the season when it is not required upon the land, arises, and reservoirs are constructed. Later the people, in the constant search for more water, turn to other streams, and irrigation reaches the stage where great rivers are turned from their course and made to pass over or through mountain ranges, in order to bring the water into the region where it can be of the greatest amount of service. There are cases of this last-mentioned development in India, China and Italy.

In our own country this same development has been taking place, the only difference being that it has probably gone ahead much more rapidly here than in any other instance in history, due partly to the tremendous advances that have been made in all lines of science, and partly to the character of the Anglo-Saxon race, which has for the first time seriously taken up the science of irrigation. In their home of centuries in middle and northern Europe and in the British Isles, the Anglo-Saxon race and the allied Germanic races have not been called upon to meet this particular problem of applying water to land for the raising of crops, and in the early settlement of this country, in its eastern half, there was no necessity for such a practice. It was only when the Mormons, driven out from their eastern settlements, started to found an empire in the deserts of Utah, where at last they were sure that the unsympathetic civilization of the Gentiles would never reach them, and a little later when the discovery of gold in California brought thousands of settlers from the East, who had to be fed from a soil which, without the artificial application of water, was sterile and barren, that irrigation began in the United States.

The early Californians learned the value of water from their mining, where, both in placer and hydraulic mining, water was diverted and used before it was dreamed of applying it to the land for agricultural purposes. In Utah, however, the use of water for irrigation was instinctive, and our irrigation really had its beginning there. As this court, however, knows from the evidence in the case of Kansas vs. Colorado, there was irrigation in parts of New Mex-

ico and Arizona long before any settlement of the western portion of the country by the Anglo-Saxon race. But it is from the irrigation in Utah and California that the beginning of our present irrigation history should be dated. The development of irrigation here has followed the course which we have mentioned before—starting out first with irrigation of small tracts of land on the banks of the stream from which the water is taken, extending constantly farther and farther back from the stream, accompanied by the building of larger ditches, by the formation of irrigating companies and irrigation districts, and finally, when the enterprises grew too gigantic, to the entry into the field by the government itself.

Never in the history of irrigation have works of such magnitude, or enterprises of such daring or ingenuity, been projected or carried through as within the last sixty years. Reservoirs have been built until the flood waters and the winter flow of our streams are as fully appropriated as the ordinary flow of the streams during the irrigating season; and now the waters of the streams of the West are, when necessary, being carried across ranges of mountains by miles of ditches, or through the mountains by long tunnels, in order that every drop of water, so far as possible, shall be taken where it can be used; and not only where it can be used, but where it can be used with the least waste and largest return. In this stage of the work, some of the tremendous undertakings of the Reclamation Service are good examples.

In what is known as the Strawberry Project in Utah, the headwaters of Strawberry Creek are stored and diverted from the Green River drainage through

a tunnel 19,200 feet long, in the Wasatch Range, into Diamond Creek, a tributary of Spanish Fork River, and there used to irrigate lands draining into Utah Lake, at a cost of over three million dollars.

In what is known as the Milk River Project, the government is taking water from St. Mary's River, which rises in northwestern Montana and flows north into Canada, emptying into the Saskatchewan River. This water is to be taken over the Continental Divide by a canal twenty-six miles in length, into the north fork of the Milk River, which flows into the Missouri River, and carried down the Milk River over 100 miles. In this course it passes from the United States into Canada, and then back into the United States, before being diverted upon the lands to be irrigated. The total cost of this project is estimated at six million, two hundred thousand dollars.

In California the development of great centers of population is forcing a search for water and a tremendous diversion, as in the case of Los Angeles, where the water of the Owens River is being taken from the east side of the Sierra Nevadas to the Pacific slope, and thence to the city of Los Angeles, at a cost of twenty-five million dollars. The city of San Francisco has long been getting its water from the hills south of the city and bringing it to a different watershed; now it is proposed to go very much farther for a similar purpose, at tremendous expense. Some of the great cities of the East have done much the same thing. Thus, New York City has taken water from numerous small watersheds, all tributary to the Hudson; while Chicago takes water from the watershed of the Great Lakes and discharges it by canals into

the watershed of the Gulf of Mexico—a fact which was commented on by this court in the case of Missouri vs. Illinois, 180 U. S., 208; ibid., 200 U. S., 496.

The part which Colorado has played in this tremendous development of irrigation can hardly be overestimated. Situate on the very crest of the Continental Divide, with a climate which makes irrigation necessary for every acre of land which is to be cultivated, and with a soil which, when the water is applied, produces with an abundance undreamed of in less-favored localities, Colorado was quick to see the necessity of irrigation, and as quick to take advantage of her knowledge. The people early saw the futility of attempting to combine irrigation with the doctrine of riparian rights with which California was struggling, and, after declaring the water to be the property of the people of the State of Colorado, set at work at once to utilize that water to the greatest possible extent for the common good. Since then Colorado has to her credit a greater number of tremendous irrigation enterprises and a more widely developed system of irrigation than any other state in the Union. The various stages in the development of irrigation have been met and, after their problems have been grappled with, have been passed. The carrying of water from one watershed to another is not new in Colorado, nor in the history of irrigation elsewhere. It has been practiced here in a great many instances, and the Supreme Court of Colorado was probably the first court to pass upon such a question in the case of Coffin vs. The Lefthand Ditch Company, 6 Colo., 443.

The present project, which the State of Wyoming is now seeking to enjoin, is another project for the transfer of water from one watershed to another, at a cost of about five million dollars, and is similar to many of the instances mentioned above. The waters of some of the tributaries of Laramie River in Colorado are proposed to be brought through a tunnel in the Continental Divide to the plains of eastern Colorado and there used for irrigation. The State of Wyoming, which, as we shall see later in this brief, has been doing exactly the same thing for a number of years, following the lead of Colorado, though on a smaller scale, since the development of Wyoming has not kept pace with the development of Colorado, is now objecting to this diversion upon a theory which seems to be a blend of the doctrine of appropriation with the doctrine of riparian rights, and which results in her taking a position not unlike the position which was taken by Kansas in the case of Kansas vs. Colorado; namely, that under some doctrine of riparian rights as between states, Wyoming is entitled to have the water come down to her from Colorado without diminution, in order that her citizens, under the doctrine of appropriation, may apply the water to irrigation.

It is unnecessary to point out to this court that the use of water for irrigation has always raised legal questions of peculiar perplexity and interest. This seems to have been the case in all nations from what records we have, though the difficulty was perhaps not so striking, since in those cases the doctrine of irrigation generally grew up with the legal history of the nation, and where there were any such diffi-

culties there was always a supreme law-making power which was not embarrassed by any troublesome constitutional questions. In this country, however, the difficulties have been and still are great. The doctrine of irrigation has not grown up with the Anglo-Saxon people nor with their laws. It has arisen *ex necessitate rei*. Our people found themselves face to face with conditions which the English people had never before faced, and for which the common law in its great mass of decisions had no adequate theory. Our system of law, however, has been sufficiently assimilative to incorporate this doctrine of appropriation and to harmonize it with the rest of our body of law, in much the same way that it absorbed the new system of law which grew up out of the customs of miners in California and finally developed into our law of mining rights. Yet, in the law of irrigation the difficulties have been greater, since it has brought into being questions which never existed in the mining law; that is, questions between states.

It is obvious that these questions could not arise in the early history of irrigation in this country, the early irrigation being merely upon lands immediately joining the river, and the irrigated land being comparatively small in quantity. The results of irrigation in one state upon another state were not felt for a number of years, until the area of irrigated land had broadened, and until the scarcity of water and its value had grown tremendously. Nor do we yet know at all fully what the result of irrigation in one state is upon the stream in another state. How far the use of water in the upper state and the conserving of water by reservoirs is a benefit instead of a detriment

to the lower state, is a question which, as this court will remember, was involved in the Kansas-Colorado case, but as to which there is still a great deal of speculation among expert engineers. In other words, we are at that period when the states are beginning to be alarmed about the diversion of water in an upper state; and yet this diversion has not continued long enough, or been sufficiently fully observed, so that the damage or benefit, as the case may be, can be authoritatively stated, or the remedy (if remedy is necessary) prescribed.

Naturally Colorado is the center of these attacks, both because of her geographic location, being the upper state in regard to all streams and the lower in regard to none, and because, on account of the advance which she has made in irrigation, she is making more use of her water than most of the states, and therefore is the first one against which complaints are directed.

This litigation over water between states is therefore of recent growth. The ultimate question involved had been foreshadowed for some time before the case of Kansas vs. Colorado by a number of suits in both the federal and state courts between individual appropriators upon the same stream in different states. All of these cases in the federal courts, and some of the state cases, have been decided by applying the doctrine of priority of appropriation between the contending appropriators, without regard to state lines. The difficulty of this doctrine, however, can be seen at once, and was seen very plainly when the states themselves finally entered the field and the case of Kansas vs. Colorado was instituted

in this court. The doctrines of priority of appropriation are not the same in all of the states. The right does not date from the same acts, and the question of procedure necessary to gain a right is entirely different. Moreover, some states have attempted to combine the doctrine of appropriation with the doctrine of riparian rights, making a still greater difficulty in adjudicating rights in different states; but with the Kansas-Colorado case the chief difficulty was immediately apparent. If, as this court has held, a state has a right to sue to restrain a diversion of water by an upper state, or, at least, if this is a proper matter to be tried out between the states themselves; and if, as must be the case, a private appropriator's right is subordinate to, and dependent upon, the right of his state, how can the rights of private appropriators in different states be determined until the rights of their respective states are fixed? In the case of Kansas vs. Colorado these questions, while they would naturally suggest themselves, could not be determined, since Kansas was basing her claim upon a doctrine of riparian rights as against the doctrine of appropriation in Colorado. In this case for the first time is presented a question of right as between two states, both of which have adopted the appropriation doctrine.

Both states desire this water for the same purpose, and this presents squarely the question: Upon what basis are the rights of the states to the waters of interstate streams to be determined? It seems to us that there are only three positions which can possibly be taken upon this matter, and from which the doctrine which this court shall decide to be the law must be taken. These doctrines are as follows:

First—This matter is to be viewed as between two sovereign nations; sovereign in so far as they have not surrendered their sovereignty by the Constitution. This is not one of the matters in regard to which sovereignty was surrendered, and each state, therefore, has exactly the same right to the development and use of its natural resources as one independent nation has against another, and that is the right to the fullest use and enjoyment of all resources within its own borders, without regard to any effect such use and enjoyment may have upon a neighboring sovereignty.

Second—Although the question is one between two sovereignties, yet the sovereignty of each state is under some limitations. While each state has full authority over its own natural resources, yet it must use those resources in such a way as not to unreasonably diminish the resources of its neighboring state.

Third—The question should be settled upon the law of prior appropriation in regard to the particular appropriations in question, and without regard to state lines.

That this is a question between two sovereignties, and therefore falls within one of the first two theories given above, is, we think, conclusively settled by the case of Kansas vs. Colorado. The third doctrine is the one laid down in the early federal cases in the Circuit Courts and the Circuit Courts of Appeal between private parties, and practically amounts to a federal regulation, or at least to a federal adjudication, of all priorities upon a stream, regardless of state lines.

If the first doctrine, which we contend is the law as between states, is adopted, it is obvious that the bill in this case presents no ground for relief on behalf of the state of Wyoming. We think it is equally plain, however, that under either of the other two doctrines the bill is also defective in failing to present any case for relief, and we shall therefore discuss these doctrines in the order above given, and also discuss the allegations of the bill in reference thereto.

BRIEF AND ARGUMENT.

I.

The State of Colorado, as one of the sovereign states of the Union, has the right to control the waters of the non-navigable streams of the state without interference by any other state.

Colorado is situate upon the crest of the Continental Divide. Six interstate streams of considerable size take their rise in its mountains: the Grand River, running westerly into the State of Utah, and there forming a junction with the Colorado; the Laramie, flowing in a northerly direction into the State of Wyoming; the South Platte, flowing northeasterly into Nebraska; the Arkansas, easterly into Kansas; the Animas, southerly into New Mexico; also the Rio Grande, having its source in the Rocky Mountains, flowing southerly into New Mexico and forming the boundary between the United States and the Republic of Mexico. None of these streams are navigable.

Colorado is essentially an arid state, incapable of growing crops except by irrigation. The precipitation

is light, varying in the farming districts from an annual minimum of eight to fourteen inches, according to the locality, to an annual average in the higher mountains of about twenty-five inches, making a general average for the entire state estimated at 14+ inches.

According to the last census, Colorado contained a population of 799,024. While much of this population was originally attracted to the state by its mining resources, these interests have become less and less important in the passing years, and it may be conservatively stated at the present time that the entire population is either directly or indirectly dependent for its very existence upon irrigation.

In another part of this brief we shall urge that if the rule of equitable apportionment shall control, the topography of the state is such that, in so far as the Laramie River is concerned, it is a physical impossibility for Colorado to secure an equitable proportion of the waters of that stream; and if it were within the issues, we think it could likewise be demonstrated that as to other streams the same is true, and that an equitable apportionment would allow Colorado the use within her borders of all the waters of the streams having their sources within the state, leaving to the lower states, with their greater precipitation, all the waters falling within their borders, together with such surplus water as may be discharged in times of flood, and at other periods when the water is not required for beneficial purposes by the upper state.

Considering the several states of the Union as independent sovereignties, we shall endeavor to show that, under the rules, principles and precedents of international law, the State of Colorado as a sovereign

state has a right to the use of the waters of all its natural streams, so far as the same may be necessary to economically and yet fully develop the resources of the state. We shall then contend that this principle of international law has not been modified, set aside or annulled by the Federal Constitution, in so far as the issues in this case are concerned.

The nature and scope of such sovereignty, with respect to judicial jurisdiction, which is one of its elements, is well set forth by Chief Justice Marshall in the early case of the Schooner "Exchange" vs. McFaddon. The case involved the inquiry as to whether an American citizen could assert in an American court a title to an armed national vessel, found within the waters of the United States, and upon this question the great chief justice said, at page 135:

> "The jurisdiction of courts is a branch of that which is possessed by the nation as an independent sovereign power. The jurisdiction of the nation, within its own territory, is necessarily exclusive and absolute; it is susceptible of no limitation, not imposed by itself. Any restriction upon it, deriving validity from an external source, would imply a diminution of its sovereignty, to the extent of the restriction, and an investment of that sovereignty, to the same extent, in that power which could impose such restriction. All exceptions, therefore, to the full and complete power of a nation, within its own territories, must be traced up to the con-

sent of the nation itself. They can flow from no other legitimate source."

Schooner "Exchange" vs. McFaddon et al., 7 Cranch, 116, p. 136.

The question under consideration is very ably discussed in an opinion rendered by Judson Harmon while attorney general in 1895. The Mexican minister had complained upon the ground that the city of El Paso del Norte had for about three hundred years enjoyed the use of the waters of the Rio Grande for irrigation, while quite recently ditches for similar purposes had been constructed in Colorado and New Mexico and used with the effect of diminishing the water supply at El Paso del Norte, thus reducing the price of land and causing other damage. The claims of the injured parties were asserted for them by the Republic of Mexico, and upon a resolution of Congress the matter was submitted by the secretary of state to the attorney general of the United States for his opinion. In the opinion the authorities upon international law are reviewed and are shown to impose no duty or obligation upon the United States requiring it to prohibit its inhabitants from the use of the water of that part of the Rio Grande lying entirely within the United States, although such use results in reducing the amount of water below in the Republic of Mexico. It was also concluded that the fact that there is not enough water in the Rio Grande for the use of both countries for irrigation purposes does not give Mexico the right to subject the United States to the burden of arresting its development and denying to its inhabitants the use of a provision which nature has supplied entirely within its own territory; that the

recognition of such a right would not be consistent with the sovereignty of the United States, as "the fundamental principle of international law is the absolute sovereignty of every nation, as against all others within its own territory."

Opinions of the Attorneys General, Vol. 21, p. 274.
Hilton vs. Guyot, 159 U. S., 113.

International servitudes are upheld by some authorities, such as Heffter and Phillemore, while others, like Grotius and Woolsey, deny their existence apart from an agreement; but, as between the states, the right is only recognized on the assumption of a concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted.

Manville Co. vs. Worcester, 138 Mass., 89.

In the case at bar Colorado has by its Constitution, statutes and decisions expressly repudiated the right, as we shall hereafter show; hence an entirely different question is presented.

1 Phillemore, Int. Law, p. 303.
Heffter, Droit Int., sec. 43.
Letters of Grotius, 2 Hert, p. 106.
Woolsey's Int. Law, sec. 58.
Missouri vs. Illinois, 200 U. S., 521.

This brings us to the consideration of the question as to whether the same rule should be applied to interstate streams between the sovereign states of the

Union as between two independent nations with reference to international streams.

The first settlers in Colorado found that the land, outside of a few small valleys in the mountains, was a desert in its natural condition, incapable of sustaining any considerable population. They soon learned, however, that by taking the water from the streams and applying it to the soil the land became very fertile and wonderfully productive, and the custom of appropriation became established, together with certain well-recognized rules and customs governing its use. These rules and customs were so just and appropriate to the situation that they soon became the basis of decision by the courts.

It has been held by this court, as well as by the Supreme Court of Colorado, that the right to use the water for the purpose of irrigation, mining and manufacturing was a right that grew out of the necessities of the people, and existed before it was written into the Constitution and laws.

Broder vs. Water Co., 101 U. S., 274.

Yunker vs. Nichols, 1 Colo., 551.

Coffin vs. Left Hand Ditch Co., 6 Colo., 443.

In this manner water was given a new status; to-wit, the status of property devoted to the public use. Later, the Constitution of the State of Colorado and other states declared the water an asset and resource of the state, subject to appropriation by its citizens for beneficial uses.

"Water Public Property—The water of every natural stream not heretofore appropriated, within the state of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided."

Constitution of Colorado, Art. XVI, sec. 5.

"Water being essential to industrial prosperity, of limited amount, and easy of diversion from its natural channels, its control must be in the state which, in providing for its use, shall equally guard all the various interests involved."

Constitution of Wyoming, Art. I, sec. 31.

"The water of all natural streams, springs, lakes or other collections of still water, within the boundaries of the state, are hereby declared to be the property of the state."

Constitution of Wyoming, Art. VIII, sec. 1.

In reference to the Colorado Constitution the Supreme Court has said:

"All unappropriated water in the natural streams of the state is dedicated to the

use of the people and the ownership is vested in the public."

Wheeler vs. Northern Colo. Irr. Co., 10 Colo., 587.

"The provisions of the Constitution are so plain that no construction whatever is needed. All unappropriated waters in these streams belong to the state, the public, the people."

Wyatt vs. Laramer-Weld Irr. Co. et al., 1 Colo. App., 480-494.

Every legislative and judicial declaration in Colorado having reference to the streams of the state and the use of the waters thereof, since the Constitution was adopted, has been in recognition and affirmance of the doctrine that the entire flow of the water within the state is impressed with a public use for the benefit of the state and the people thereof. The statutes concerning the adjudication of priorities, of rights to water, contemplated the appropriation of all the waters flowing in Colorado for use on lands in Colorado. The statutes creating the offices of state engineer, division engineer and water commissioner, and authorizing them to control the distribution of the water of the several streams, are all based upon the assumption that the water belonged to the state. These statutes either in terms declare or by implication assume that the districts are restricted to lands within the state and not elsewhere.

Lampson vs. Vailes, 27 Colo., 201.

Turley et al. vs. Furman et al. (N. M.), 114 Pac., 278.

Colorado by her very necessities has been driven to declare her paramount right to the exclusive use of the water of her natural streams, in so far as her necessities require the use of such water for beneficial purposes within the state, and her Constitution and statutes negative any assumption of any concurrence between herself, on the one hand, and Wyoming or any other state, on the other hand, whereby the waters of these streams are to be apportioned with other states. The question presented here is one that was expressly left undecided in the case of Bean vs. Morris, 221 U. S., 485; to-wit: To what limits may the upper state go when it seeks to do all that it can? In that case, at page 488, the court said:

> "It follows from what we have said that it is unnecessary to consider what limits there may be to the powers of an upper state if it should seek to do all that it could."

The Constitution extends judicial power of the Supreme Court to controversies between states and gives the court original jurisdiction in cases in which a state shall be a party.

> "Therefore, if one state raises a controversy with another, this court must determine whether there is any principle of law and if so, what, upon which the plaintiff can recover."
>
> Missouri vs. Illinois, 200 U. S., 496-519.

In reference to such controversies the court is in the nature of an international tribunal to which the

several states have agreed to submit certain controversies. The fact that it must decide does not mean that it takes the place of a legislature, or that it is vested with arbitrary or with treaty-making power. It must, we think, be governed by principles explicitly or implicitly recognized, but it does not follow that every matter which would entitle a mere private party to redress would warrant interference by this court with the action of a state.

Missouri vs. Illinois, *supra*, p. 521.

In the case of Georgia vs. Tennessee Copper Co., 206 U. S., 230, some peculiarities are said to mark a suit between a state and a private party, and that, if a state has a case at all, it is somewhat more certainly entitled to specific relief (by injunction) than a private party might be; but this has reference to the nature of relief to be granted, and not to the cause of action itself. The reasoning in that case is only applicable where suit is against an individual, and not against a state as here. In this case we have a state defendant as well as one complainant.

There not being enough water at times for irrigation in both states, the question is the same here as in the Rio Grande case passed upon by Attorney General Harmon; viz.: Which state shall yield to the other?

This case is unlike the case of Missouri vs. Illinois, where the bill sought relief against the pouring of sewage and filth through an artificial drainage canal into the Mississippi River, to the detriment of the State of Missouri and its inhabitants.

Missouri vs. Illinois, 180 U. S., 208.

Missouri vs. Illinois, 200 U. S., 496-517.

So, also, the State of Georgia vs. Tennessee Copper Company, *supra*, is readily distinguishable, for the reason that in the Georgia case the action was to prevent the discharging of sulphurous fumes from the works of the defendant company in Tennessee so as to pollute the air over large tracts of territory in the State of Georgia, thereby causing wholesale damage to forest and vegetable life therein, if not to health in the latter state.

In each of the cases mentioned a *direct invasion* and injury by one of the sovereigns of the territory of the other was contemplated; but here an entirely different question is presented. In this case we have a duplicate of the Rio Grande case hereinbefore quoted from, and we feel that we cannot improve upon the language of the attorney general:

> "The injury now complained of is a remote and indirect consequence of acts which operate as a deprivation of prior enjoyments. So it is evident that what is really contended for is a servitude which makes the lower country dominant and subjects the upper country to the burden of arresting its development and denying to its inhabitants the use of a provision which nature has supplied entirely within its own territory.
>
> Such a consequence of the doctrine of international servitude is not within the language used by any writer with whose works I am familiar and could not have been within the range of his thought without finding expression."
>
> **Opinion of Attorney General Harmon,** *supra*, pp. 280-281.

The several states of the Union are sovereign as to all powers except those delegated to the federal government, having all the functions essential to separate and independent existence. Their preservation and the maintenance of their governments are as much within the care of the Constitution as is the national government.

Kansas vs. Colorado, 185 U. S., 125.
Kansas vs. Colorado, 206 U. S., 46.
1st Wharton Digest International Law, sec. 1.
Rhode Island vs. Mass., 12 Peters, 720.
People vs. Tyler, 7 Mich., 255.

"The states of the Union are a single state in all matters concerning the Federal body as a whole, and yet a group of states, perfectly independent in all matters which concern each member of the group, as a local, self-governing community."

Taylor on International Law, sec. 124.
Texas vs. White, 7 Wallace, 720, 721.
Wheeler vs. Smith, 9 Howard, 78.

"The powers affecting the internal affairs of the state not granted to the United States by the Constitution nor prohibited by it to the states are reserved to the states respectively and all powers of a national character which are not delegated to the National

Government by the Constitution are reserved to the people of the United States."

Kansas vs. Colorado, 206 U. S., 90.

The powers not delegated may be exercised by each state over all persons and properties within its boundaries.

Pennoyer vs. Neff, 95 U. S., 722.

This power may be exercised to the extent of restricting free navigation under certain circumstances.

Escanaba Transportation Co. vs. Chicago, 107 U. S., 678.

In the case of the Hudson Water Company vs. McCarter, 209 U. S., 349, this court sustained a law of the State of New Jersey prohibiting the transportation of water of the state into another state. In that case the problems of irrigation had no place, but, in speaking of the right of a state to keep and control its natural advantages, the court says:

"We are of the opinion further that the constitutional power of the state to insist that its natural advantages shall remain unimpaired by a citizen is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and there are benefits from a great river that might escape a lawyer's view. But the State is not required to submit even to an æsthetic

analysis. Any analysis may be inadequate. It finds itself in possession of what all will admit to be a great public good and what it has it may keep and give no one a reason for its will."

Hudson Water Co. vs. McCarter, 209 U. S., 349, pp. 356-357.

Of course, a citizen of another state has no greater rights than a citizen of the state within which the resources are situate, and, aside from the question of irrigation, we think the language quoted is applicable to the case at bar. It may be contended, however, that a different rule has been established by this court with reference to irrigation from interstate streams.

Kansas vs. Colorado, 185 U. S., 125.

Ibid., 206 U. S., 46.

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S., 258-261.

Bean vs. Morris, 221 U. S., 485.

In a Kansas vs. Colorado, *supra*, it is said:

"It cannot be denied in view of all the testimony * * * that the diminution of the flow of water in the river by the irrigation of Colorado has worked some detriment to the Southwestern part of Kansas, and yet when we compare the amount of this detriment with the great benefit which has obviously resulted to the counties in Colorado, it would seem that equality of right and equity

between the two states forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation."

Kansas vs. Colorado, 206 U. S., 113-114.

In the case of Rickey vs. Miller, *supra*, the court sustained the jurisdiction of a federal court in Nevada which was proceeding to determine a question of priority of appropriation as between two individual appropriators claiming priorities for irrigation in different states from an interstate stream.

In Bean vs. Morris, 221 U. S., 485, the jurisdiction of the lower court was again sustained in a proceeding to determine the priority of appropriation as between individual appropriators in different states. In this case the court, laying aside the question of the rights of the states, indulges in the presumption that the policy of both states is the same.

From the very nature of the *res*, there must be an inevitable conflict between the doctrine of apportionment between states and the doctrine of prior appropriation between the citizens of different states.

If the rule of apportionment between states is the correct one, after the apportionment has been made, the water of each state belongs to that state, the public, subject to state laws of appropriation for beneficial uses. The two doctrines can only be worked out by first making an equitable division between the states, leaving the distribution of the water allotted to each state for determination by the state under its law, without interference by appropriators in the other state.

In other words, under any rule of equitable apportionment between the states, it would seem to be inconsistent to hold that any question in any instance can be decided as between appropriators in different states. For example, if in the controversy between Wyoming and Colorado there is to be an apportionment of the waters equitably between the two states, how can any single appropriator in either state have any right which can be quieted as against any individual appropriator in the other state?

It appears from the bill of complaint in this case that there are a large number of individuals and corporations claiming water rights from the Laramie River in the State of Wyoming, and a number claiming water rights from the same river in the State of Colorado. If this controversy should be first tried out in a suit between the individual claimants, as in Rickey vs. Miller, and thereafter one of the states brings a separate action to determine the equitable apportionment of the water between Wyoming and Colorado, would not this necessarily result in overthrowing such rights as might be determined to exist between the individual claimants?

In the Kansas-Colorado case the court disposed of the private parties defendant to the bill in this language:

> "While several of the defendant corporations have answered, it is unnecessary to consider their defenses for if the case against Colorado fails, it fails also as against them."
>
> 206 U. S., at p. 85.

II.

It does not appear from the bill that the substantial interests of the State of Wyoming are being or will be injured by Colorado, its corporations or citizens, to the extent of destroying the equitable apportionment of benefits between the two states resulting from the flow of the Laramie River.

In case the doctrine of an equitable division between states shall be finally adopted as the better one, all things considered, then we say that complainant by her bill has not stated a cause for equitable relief. The bill alleges, upon page 2, that the stream rises in the mountainous district of northern Colorado, and flows in a general northwesterly course for about 27 miles in Colorado; thence northerly and northeasterly for a distance of about 150 miles in Wyoming. Upon page 4 the watershed or drainage basin of the Laramie River and its tributaries in Colorado is given as 395 square miles, while the watershed and drainage basis of the river and its tributaries in Wyoming is stated as 3,632 square miles. In other words, the drainage area tributary to the stream in Wyoming is more than nine times as great as the drainage area tributary to the stream in the State of Colorado.

Although Wyoming is north of Colorado, the elevation of the Laramie River is less in Wyoming than in Colorado, rendering it impossible for Colorado to ever receive any advantage of any portion of the water that falls within the State of Wyoming. But this is not all. An examination of the exhibits filed with the bill and made a part thereof will affirma-

tively show that the greater part of the small drainage area of the stream in Colorado is below all the ditches constructed or contemplated for taking water out of the stream for use in the State of Colorado. In other words, it affirmatively appears from the bill and exhibits that the threatened diversion of the defendants will tap about 67.9 square miles of the entire watershed of the Laramie within Colorado, which watershed is about 395 square miles, and that the diversion does not take the entire run-off of even 67.9 square miles within the State of Colorado, because that portion of the watershed lying between what is shown on Exhibit "B" as the two collection ditches is not tapped by the diversion works of the defendants. The section of the stream from which Colorado may divert water carries the run-off of only about one-sixth of the watershed within Colorado, and only about one-fifth of the run-off within that state.

We are therefore justified in urging that it affirmatively appears that Colorado has not taken and cannot take an equitable proportion of the water of the stream.

In another part of the bill, pages 2 and 3, it is alleged that the drainage basin of the river in Colorado is mountainous and heavily timbered, where snows fall in winter to a great depth, which, melting in the spring and summer, have, from time immemorial, supplied the water flowing in the channel of the Laramie River and its tributaries, etc. The pleader has not advised the court as to the amount of the precipitation in Colorado, or given any enlightenment whatever in reference to this very material and important subject. These are matters that could be

easily ascertained from the various reports of the proper officers of the federal and state governments, and failure to state these facts should not be looked upon with favor by the court.

Aside from this, as we have stated, the greater part of the drainage area of this river in Colorado is, owing to the topography of the country, not available in the upper state, but is available each season in the lower state, Wyoming.

The complainant alleges, on page 16 of the bill, that the defendants have already begun the construction of a tunnel or tunnels through the walls of said watershed, in order to convey the water for use upon another watershed. It must be assumed that the use the defendants have made and will make of the water so to be conveyed will be a most reasonable and beneficial use, and necessary to the reasonable development of lands within the State of Colorado.

The bill is more noticeable for what it fails to state in regard to certain matters than for the facts pleaded. That the tunnel spoken of had been run through the mountain for a distance of two and one-half miles, and was practically completed at the time the bill was filed, at a cost of more than a half million of dollars; that two millions of dollars had been expended in the construction of an irrigation system for the use of this water; that bonds had been sold, lands prepared for agriculture, and homes built in reliance upon the water so to be diverted from the Laramie River, were matters of general and public knowledge in the States of Colorado and Wyoming, and we submit that the pleader is not justified in the bare statement of the bill that Colorado and its citizens "have

already begun the construction of a tunnel or tunnels through the walls of said watershed."

At the time the bill was filed in the case of Kansas vs. Colorado (1902), the question of interstate water rights had received very little attention, and the pleader in that case was perhaps not required to strictly conform to the usual rules of pleading. Owing to the uncertainties then involved in such controversies, exactitude in pleading was not required; but in that case, and since, the matter has been so thoroughly considered and so exhaustively treated by this and other courts that we think greater strictness should be required in the present case.

In the Kansas-Colorado case the court said, at pages 117-118:

> "Summing up our conclusions, we are of the opinion that the contention of Colorado of two streams cannot be sustained; that the appropriation of the waters of the Arkansas by Colorado, for purposes of irrigation, has diminished the flow of water into the State of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the

valley it has worked little, if any, detriment, and *regarding the interests of both States and the right of each to receive benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree.* At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes.

"The decree which, therefore, will be entered will be one dismissing the petition of the intervenor, without prejudice to the rights of the United States to take such action as it shall deem necessary to preserve or improve the navigability of the Arkansas River. The decree will also dismiss the bill of the State of Kansas as against all the defendants, without prejudice to the right of the plaintiff to institute new proceedings whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations or citizens, the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two States resulting

from the flow of the river." (The italics are ours.)

This case has been cited with approval.

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S., 261.

Bean vs. Morris, 221 U. S., 485-486.

Mr. Wiel, in the third edition of his very excellent work upon Water Rights in the Western States, reaches the following, among other conclusions, regarding interstate streams:

> "The matter is now in a stage of development, and any conclusions must be tentative only. We suggest the following drawn from the foregoing authorities:
>
> (a) Between States, each is entitled to have for its prosperity an equitable apportionment of benefits from an interstate stream. Consequently, control of interstate streams is likely to gravitate toward the formation of joint commissions between the States to supervise their use and make regulations."

1 Wiel Water Rights in the Western States, sec. 345, p. 372.

In discussing the rule between riparian owners in one state and appropriators in another, Mr. Wiel, in section 342, page 364, says:

> "In the late case of Rickey etc. Co. v. Miller, in the supreme court of the United

States, the decision upon a question of procedure below referred to was based upon the principle of Kansas v. Colorado, that riparian owners in California or appropriators in Nevada, upon the Walker River crossing the boundary, must deduce any right they may have from the law of their respective States; and the enforcement of either right beyond the boundary of its State must depend upon the concurrence of the other State. Unless the upper State (California) will voluntarily impose conditions upon its citizens in favor of users in the lower State (Nevada), the latter have no right in the matter other than to complain that the lower State as such (and not merely the plaintiff) is not receiving an equitable share of the benefit of the stream. This seems to make rights upon interstate streams a matter of interstate relation, reachable by creation of joint commissions between the States interested, to establish rules for such streams."

The same author, in his discussion of the rule that should be applied between appropriators in different states, says, at paragraph 343, pages 364 and 365:

"As in the preceding sections, the supreme court of the United States rules that rights upon interstate streams are a matter of interstate concern (similar to international concerns, regarding the States as each a sovereign). Consequently it is for the States

> concerned to see that each receives by joint arrangement, an equitable apportionment of benefit from the stream, opening the way for joint commissions between the States to govern interstate streams."

As to the nature of the proof required to make out a case in a controversy between states, this court has said:

> "Before this court ought to intervene, the case should be of a serious magnitude, clearly and fully proved, and the principle to be applied should be one which the court is at perfect liberty to maintain against all considerations on the other side."
>
> Missouri vs. Illinois, 200 U. S., 521.

By a fundamental rule of universal application, the *probata* cannot go beyond the *allegata*, but must conform thereto. As was said by Sanborn, circuit judge, speaking for the Court of Appeals of the Eighth Circuit:

> "A court can consider only what is in issue under the pleadings. Averments without proofs and proofs without averments are unavailing. The judgment may not go beyond a determination of the issues presented by the pleadings nor beyond the scope and object of the prayers which they contain. These are axioms of the law of pleading and practice. They rest upon the basic principles of our jurisprudence that no man shall be deprived of his life, liberty or property

without due process of law; due process of law must give to the parties to be affected an opportunity to be heard respecting the justice of the judgment sought. It must be one which gives notice of the issue to be determined, which hears before it condemns, proceeds upon inquiry, and renders judgment only after trial."

Gentry vs. U. S., 101 Fed., 51.

If the holding of this court in Kansas vs. Colorado, *supra*, is that the doctrine of equitable apportionment should govern as between states, it does not appear from the bill that the threatened diversion will deprive Wyoming of her equitable part of the waters of the Laramie River.

III.

The Bill of Complaint Does Not State a Cause of Action Under the Doctrine of Prior Appropriation.

The allegation of the bill in this respect is:

"And your orator further avers that prior to the commencement of the wrongs or threatened wrongs hereinafter set forth, your orator and its citizens within the area of the drainage basin of said Laramie River and its tributaries in the state of Wyoming, had appropriated all the available waters of the said Laramie River and its tributaries above the required flow thereof for riparian

> proprietors as herein set forth, for the actual irrigation of the lands of your orator and its citizens within the drainage basin and water shed of the said Laramie River, to-wit, for the irrigation of more than 325,000 acres of land within the said water shed and drainage basin."
>
> Bill of Complaint, p. 14.

This is a mere allegation of a conclusion of law, and the pleading contains no statement of facts upon which the conclusion is based. This is not sufficient.

In the case of Farmers High Line Canal & Reservoir Company et al. vs. Southworth, 13 Colo., 111, the plaintiff alleged that he had a priority, without stating any facts with reference thereto, and that the defendant's right was subsequent in point of time to such priority. A demurrer upon this ground was filed and overruled by the trial court. Upon appeal, the Supreme Court held that the demurrer should have been sustained, and said:

> "In pleading an appropriation, it is necessary to plead the facts which constitute the appropriation."

The case of Church vs. Stillwell et al., 12 Colo. App., 43, was an action in reference to water rights for reservoir purposes, and the court said, at page 48:

> "In a suit to determine the priorities of such right, it is not sufficient for the plaintiff to merely allege in his complaint that he has the priority of right. That is a legal conclusion. He must specifically aver all of

the subsequent facts which are necessary to constitute such priority."

Carroll vs. Vance, 39 Colo., 216; 88 Pac., 1069.

Wutchumna Water Co. vs. Pogue, 151 Cal., 105; 90 Pac., 362.

The rule which requires the facts to be pleaded is not technical, but substantial; not a useless requirement, but necessary to advise the opposite parties and the court of the true nature and objects of the suit. If the pleader had stated the facts upon which the allegation in this case is made—this conclusion of law asserted—such facts would perhaps reveal that the valid appropriations on the Laramie River can be satisfied with the run-off of the drainage basin of that river, and yet leave a sufficiency of water to supply the alleged diversion of the defendants. The defendants ought not to be haled into court to meet litigation as grave in its character as that initiated by this proceeding, unless a clear case is stated in the bill of complaint. How were the appropriations which the complainant seeks to protect initiated? When and in what manner have they been perfected, if at all? are questions upon which the bill is entirely silent. Although the opinion upon demurrer in the Kansas-Colorado case intimates that less exactness will be required where a state is complainant than as between mere private litigants, this was, we think, said with reference more particularly to an equitable division of water between the states, and hence does not apply to the phase of the controversy now under consideration; to-wit, that the bill

does not state a cause of action as between contesting appropriators under the doctrine of prior appropriations.

PLACE OF USE NOT MATERIAL.

It is stated in the complaint, and objection is founded upon it, that this water is being carried to another watershed. If the court upholds the contention of the defendants that the State of Colorado has the absolute right to use for beneficial purposes within the state all the waters falling within its borders, the particular place of use within the state is eliminated from consideration; so, likewise, if the doctrine of equitable apportionment shall be the basis of decision, we assume that the place of use of the water awarded to Colorado will be left entirely to the state. If, however, the doctrine of prior appropriation is to be the rule of decision in this case, we shall still claim that the place of use within the state is unimportant. In Kansas vs. Colorado, 206 U. S., 46, the court, at page 94, in speaking of the state, said:

> "It may determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the west of the appropriations of water for the purposes of irrigation shall control. Congress cannot enforce either rule upon any state."

See also:

> U. S. vs. Rio Grande Irr. Co., 174 U. S., 690.

We have already shown that the doctrine of prior appropriation has always been the law of the arid regions of the United States, and that all legislation has been based upon the voluntary recognition of pre-existing rights. (U. S. vs. Rio Grande Irr. Co., *supra.*) This doctrine of diversion and appropriation obtaining in the arid regions has arisen from the necessity of the situation, and the same reason that justifies the doctrine justifies taking the water to another watershed. It is the law, and has always been the custom throughout the arid regions, to make application regardless of the watershed. In fact, in order to secure the benefit of the right of appropriation, it is in many cases absolutely necessary to make application of the water upon another watershed. Both Colorado and Wyoming recognize and enforce the doctrine of appropriation, and also the right to apply to another watershed. The following cases in Colorado recognize the right to divert water from one watershed to another:

Coffin vs. Left Hand Ditch Co., 6 Colo., 443, 449.

Thomas vs. Guirand, 6 Colo., 530, 532.

Hammond vs. Rose, 11 Colo., 524, 526.

Oppenlander vs. Left Hand Ditch Co., 18 Colo., 142-144.

Coffin vs. Left Hand Ditch Company, *supra*, has been cited and followed in Wyoming.

Moyer vs. Preston, 6 Wyo., 308, 318, 321.

Willey vs. Decker, 11 Wyo., 496, 516, 528, 530.

Coffin vs. Left Hand Ditch Company, *supra*, is cited with approval in the following federal cases:

Boquillas Cattle Co. vs. Curtis, 213 U. S., 339, 347.

Cascade Town Co. vs. Empire Water & Power Co., 181 Fed., 1014 and 1015 (C. C. Colo.).

Snyder vs Colorado Gold Dredging Co., 181 Fed., 65 (C. C. A.).

The following excerpt from the opinion of the court in Coffin vs. Left Hand Ditch Company, *supra*, is applicable:

> "The doctrine of priority of right by priority of appropriation for agriculture is evoked, as we have seen, by the imperative necessity for artificial irrigation of the soil. And it would be an ungenerous and inequitable rule that would deprive one of its benefit simply because he has, by large expenditure of time and money, carried the water from one stream over an intervening watershed and cultivated land in the valley of another. It might be utterly impossible, owing to the topography of the country, to get water upon his farm from the adjacent stream; or if possible, it might be impracticable on account of the distance from the point where the diversion must take place and the attendant expense; or the quantity of water in such stream might be entirely insufficient to supply his wants. It sometimes happens that the most fertile soil is found

along the margin or in the neighborhood of the small rivulet, and sandy and barren land beside the larger stream. To apply the rule contended for would prevent the useful and profitable cultivation of the productive soil, and sanction the waste of water upon the more sterile lands. It would have enabled a party to locate upon a stream in 1875, and destroy the value of thousands of acres, and the improvements thereon, in adjoining valleys, possessed and cultivated for the preceding decade. Under the principle contended for, a party owning land ten miles from the stream, but in the valley thereof, might deprive a prior appropriator of the water diverted therefrom whose lands are within a thousand yards, but just beyond an intervening divide." (Pp. 449-450.)

In Willey vs. Decker, *supra*, the Supreme Court of Wyoming, at page 531, quotes with approval the following from the Colorado case of Oppenlander vs. Left Hand Ditch Co., *supra:*

> "The appropriator, though he may not own the land on either bank of a running stream, may divert the water therefrom and carry the same whithersoever necessity may require for beneficial use, without returning it or any of it to the natural stream in any manner."

See also:

> Wiel on Water Rights in the Western States, p. 365.

Black's Pomeroy on Water Rights, sec. 47.
Offield vs. Ish, 21 Wash., 277; 57 Pac., 809.
Long on Irrigation, p. 50.

This doctrine of diversion of water from one watershed to another is determined by the local necessities, and obtains throughout the world for domestic and irrigation purposes, without returning the water to the natural stream in any manner. Whether the water shall be taken across a divide and used upon the lands drained into another stream is simply an incident of locality. This rule is not characteristic of any set of laws or of any particular civilization, but is the outgrowth of human conditions.

The court will take judicial notice that the doctrine that water may be diverted to non-riparian land is recognized and followed by the Reclamation Service of the United States government in irrigation enterprises throughout the arid regions; also by the State of Wyoming, the State of Colorado, and by other arid states and countries. All this without limit as to the place of application. Some examples of this have already been referred to.

> "It has been very justly observed at the bar, that the court is bound to take notice of public facts and geographical positions."
>
> U. S. vs. Rio Grande Irr. Co., 174 U. S., 690.

> "The law of any State of the Union, whether depending upon statutes or upon opinions, is a matter of which the courts of

the United States are bound to take judicial notice without plea or proof."

Lamar vs. Micou, 114 U. S., 218-223.

The proposed Bear River diversion works in Utah is an example. This project is mentioned in several reports of the Reclamation Service, from the second to the seventh.

A large number of other federal reclamation projects, diverting water from one watershed for the irrigation of lands upon a different watershed, are described in Public Document No. 1262 of the Sixty-first Congress, Third Session, the same being a message from the President of the United States transmitting a report of the Board of Army Engineers in relation to the Reclamation Fund for the reclamation of arid lands.

In Wyoming, in practice, water is taken from one watershed to another in numerous instances. The greatest number of these cases are in the valley of the Powder and Tongue Rivers near Buffalo and Sheridan, Wyoming. The most notable case, and one which is almost exactly parallel to the diversion from the Laramie River into the Poudre Valley, of which complaint is made in this case, is that of a group of ditches taking water from the Piney, a tributary of Powder River, to Prairie Dog Creek, a tributary of Tongue River. In other words, this water is taken from the Powder River watershed to the Tongue River.

It therefore appears that, by common consent, waters may be taken from one stream for use upon a different watershed, whenever the topography of the country requires this to be done in order to secure the

best results, and that this practice is supported by both reason and authority.

To recapitulate, we conclude that the states should each have the right to control the waters of their non-navigable streams within their borders; but if the court shall conclude that the doctrine of equitable apportionment between states is the proper one, the demurrer should be sustained for the reason that the bill does not state a cause of action for equitable relief. The doctrine of priority of appropriation, which has sometimes been applied between individual appropriators in different states, can have no application in this case; and, even if it had, the bill does not contain facts sufficient to make a case.

For the reasons given, we respectfully submit that the demurrer should be sustained and the bill dismissed.

IN EQUITY

THE STATE OF WYOMING, COMPLAINANT,

vs.

THE STATE OF COLORADO, THE GREELEY-POUDRE IRRIGATION DISTRICT, A MUNICIPAL CORPORATION, THE LARAMIE-POUDRE RESERVOIRS AND IRRIGATION COMPANY, A CORPORATION, DEFENDANTS.

ANSWER OF THE STATE OF COLORADO.

This defendant, the State of Colorado, now and at all times hereinafter saving to itself all and all manner of benefit or advantage of exception or otherwise that can or may be had or taken to the many errors, uncertainties and imperfections in the said bill of complaint contained, for its answer thereto, or to so much thereof as it is advised it is material and necessary for them to answer to, saith:

I.

Admits that the greater extent of the drainage basin of the Laramie River in Colorado is in a mountainous and heavily timbered country, where snows fall in winter, but denies that the run-off from said drainage basin supplies all of the waters flowing in the channel of the Laramie River and its tributaries. Defendant avers that less than one-half of the run-off of the Laramie River is supplied by the drainage basin of the Laramie River and its tributaries within the State of Colorado. Defendant avers that among the tributaries of the Laramie River rising in the mountainous regions of Colorado and discharging their waters into the Laramie River, in addition to those enumerated in the bill of complaint, are Johnson Creek and Beaver Creek. Defendant denies that Complainant's Exhibit A shows either the drainage basin of the Laramie River and its tributaries, or the irrigated lands thereunder, within the State of Wyoming, and avers that the map attached to the joint and several answer of the Greeley-Poudre Irrigation District and The Laramie-Poudre Reservoirs and Irrigation Company, marked Exhibit I and made a part of this answer, shows the drainage basin of the Laramie River and its tributaries, and the irrigation ditches and works taking water therefrom, within the State of Wyoming, but avers that only about 25,000 acres of the lands designated on Exhibit I as irrigated lands were under irrigation at the time of the inception of the defendant's, The Laramie-Poudre Reservoirs and Irrigation Company's rights to divert water through the tunnel mentioned

in the bill of complaint, and which diversion is sought to be enjoined herein. Defendant denies that the map marked Exhibit B, attached to the bill of complaint, is a correct map of the drainage basin of the said river and its tributaries within the State of Colorado, and avers that Exhibit I, heretofore mentioned, and made a part of this answer, is a true map of the last-mentioned drainage basin. Defendant admits that the larger part of the watershed of said river and its tributaries in Colorado is mountainous, rocky, and timbered, and avers that a large portion of the 3,865 square miles of the drainage area of said river and its tributaries in Wyoming is also mountainous, rocky, and timbered, upon which the precipitation of moisture is great, and from which the run-off is about 500,000 acre-feet annually. Defendant avers that a considerable part of the run-off from the drainage area of said river and its tributaries within Colorado enters the Laramie River after it enters the State of Wyoming. Defendant avers that about 4,000 acres of the drainage basin of said Laramie River and its tributaries within Colorado are of irrigable character. Defendant denies that the greater portion of the drainage area of said river and its tributaries in Wyoming is irrigable and productive, and avers that not to exceed 100,000 acres of the drainage area of the said river and its tributaries within the State of Wyoming are productive under irrigation; that of this area about 50,000 acres lie in said drainage area between the Colorado line and the Wheatland Reservoir, as shown on Defendant's Exhibit I, which last-mentioned area is located at a high altitude—to-wit, about 7,500 feet—where the irriga-

tion season is short—to-wit, about six weeks—commencing about the fifteenth of June, and the lands of which are of inferior quality, unproductive, adapted to raising only limited crops. Defendant further avers that the remaining portion of the lands in the drainage basin of said river and its tributaries, lying in the vicinity of Wheatland, aggregate about 50,000 acres. This land has some productivity, but the greater part of the irrigation rights therefor were initiated long after the inception of the rights through which these defendants make claim to divert a part of the waters of said river and its tributaries, through the tunnel mentioned in the bill of complaint. Defendant admits that prior to the act of Congress of July 25, 1868, creating the Territory of Wyoming, that portion of the watershed and drainage basin of the Laramie River and its tributaries which is now within the State of Wyoming was within the boundaries and subject to the laws of the Territory of Dakota; but denies that at any time the riparian proprietors on said stream had the right to have the waters of said stream or its tributaries flow across or along their lands unpolluted and undiminished. Defendant avers at no time did the doctrine of riparian ownership of waters obtain in that part of Dakota Territory, since said act of Congress a part of the State of Wyoming. Defendant avers that at no time has it been the law that diversions of water from said stream or its tributaries in Wyoming, or diversions therefrom made in Colorado for application in Wyoming, could be made to the prejudice of the rights of the State of Colorado in the exercise of her inherent sovereign power to divert from

the section of the Laramie River within Colorado the entire run-off of said section for use within the State of Colorado. Defendant avers that change in the point of diversion, the place of use, and the kind of use, where the same is made from the section of the stream within Colorado, may at any time be made within the State of Colorado, provided the same can be done without prejudice to any existing appropriations within the State of Colorado. Defendant further avers that the waters of said stream and its tributaries within the State of Colorado constitute a part of the natural resources of, and were and are owned by, the State of Colorado, subject to the right of appropriations thereof under her laws. Defendant avers that the right of appropriation and use of the waters of said stream and its tributaries within Colorado is to no extent affected by, or subject to, the laws of any other sovereignty than that of the State of Colorado. As to whether or not the United States of America in 1862, or at any other time, granted to the Union Pacific Railway Company 350,000 acres of land, or any part thereof, within the State of Wyoming, riparian to the Laramie River and its tributaries, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. As to whether or not the last-mentioned lands, or any part thereof, have passed from said railroad company, or are at this time owned or possessed by 1,500 or any other number of people, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. This defendant denies that the right to the continuous flow of the waters of said river, or any part thereof, or any of

the waters of its tributaries, is vested in the citizens of complainant; denies that the doctrine of continuous flow or of riparian rights at any time obtained in the drainage basin of the Laramie River and its tributaries within the State of Wyoming; admits that, prior to the commencement of construction of the system of irrigation having for its purpose the diversion by the defendants of a part of the waters of the Laramie River and its tributaries, some of the lands lying along said river and its tributaries had been settled and improved, and that some part thereof had been rendered more productive by irrigation from said stream and its tributaries, but avers that the run-off of said river and its tributaries was ample to supply the demands and rights so created, and leave an abundance of water to supply the diversions sought to be enjoined herein. Defendant denies that the lands of said area without the use of water, the diversion of which is sought to be enjoined herein, would be rendered valueless, and also denies that 20,000 people, or any number in excess of 2,000, residing upon said lands, are supported, directly or indirectly, by reason of the irrigation and cultivation of said lands; denies that $20,000,000, or any sum in excess of $500,000, had been expended within the State of Wyoming in the development or use of the waters of said stream or its tributaries, prior to the initiation of the rights of the defendant, the Laramie-Poudre Reservoirs and Irrigation Company. As to whether or not 400,000 acres of land lying in the drainage basin of said river and its tributaries within the State of Wyoming had been patented by the United States of America prior to the commencement

of construction of its said system of irrigation by defendant, the Laramie-Poudre Reservoirs and Irrigation Company, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. As to what number of acres of the last-mentioned land are now owned, possessed, or occupied by citizens of complainant, defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. Defendant admits that certain of the waters of said river and its tributaries are used by citizens of towns and villages in Wyoming, but avers that there is more than sufficient run-off in said stream and its tributaries to satisfy such needs and to supply the rights of the defendants sought to be enjoined in this suit; admits the existence of certain appropriations from said river and its tributaries prior to the commencement of construction of the defendant's system of irrigation, mentioned in the bill of complaint, but avers that the run-off of said stream and its tributaries was and is more than sufficient to satisfy the same and the diversions sought to be enjoined in this action. As to whether or not complainant is the proprietor of 50,000 acres of land within said watershed, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. Defendant admits that prior to the commencement of construction of the irrigation system for the purpose of the diversions, sought to be enjoined herein, certain citizens of the State of Colorado had appropriated, for the purpose of irrigating certain lands within said drainage basin, certain waters of said river and its tributaries, and avers that such appropriations

amounted to about 8,000 acre-feet of water per annum. As to what part of said waters, applied within the drainage basin of Colorado, has heretofore returned to the stream and its tributaries, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. Defendant avers that other appropriations of said waters of said Laramie River and its tributaries had been made by the State of Colorado and its citizens within the State of Colorado, prior to the appropriations of said waters by complainant and its citizens, as set forth in the complaint, and avers that on the 25th day of August, 1902, the defendant The Laramie-Poudre Reservoirs and Irrigation Company, and its predecessors in title, by commencement of construction, initiated its rights to the diversion, for the purpose of irrigation and domestic use, through the tunnel mentioned in the bill of complaint, to 1235 *second-feet* of water, and that at the time of the initiation of such rights of the defendant The Laramie-Poudre Reservoirs and Irrigation Company and its predecessors in title, there was abundant water in the said stream to satisfy all prior appropriations then in existence in the State of Colorado and in the State of Wyoming. Defendant denies that, prior to the threatened diversion sought to be enjoined in the complaint, the plaintiff and its citizens had appropriated all of the available waters of the said Laramie River and its tributaries, but avers that at such time there was ample run-off in said stream, and that there is now ample water therein, to supply the threatened diversions of these defendants and all prior rights in the State of Wyoming. Defendant avers that at no time prior to

the institution of this suit had more than 50,000 acre-feet annually been taken from said stream and its tributaries for use in the State of Wyoming. Defendant avers at the time of the initiation of the rights, the exercise of which is sought to be enjoined in this suit, rights for the appropriation of water for irrigation and domestic use in the State of Wyoming had been created or initiated for not exceeding 50,000 acre-feet, and avers that at such time there was available to supply such last-mentioned rights or initiated rights more than 800,000 acre-feet annually in the run-off of said stream. As to whether or not the plaintiff had, and its citizens had, at any time employed the waters of said stream and its said tributaries, for the subirrigation of 25,000 acres of land riparian to said stream and its said tributaries, said land being owned and possessed by said complainant and its citizens, and for live-stock and domestic uses, this defendant has not and cannot obtain sufficient knowledge or information upon which to base a belief. Defendant denies that the waters sought to be diverted through the tunnel mentioned in the bill of complaint would render the lands lying within the basin of said stream and its tributaries, within the State of Wyoming, to a large extent valueless and unable to support any considerable population; denies that the use of the waters so sought to be enjoined would add the value of $10,000,000 to the lands within said watershed within the State of Wyoming, or would enable said land to support a population of 20,000 people, or any other considerable number of people; denies that the diversion sought to be enjoined herein would render the lands in the water-

shed of said stream and its tributaries within Wyoming valueless. Defendant denies that it and its co-defendants are threatening to divert, by the tunnel mentioned in the bill of complaint, or otherwise, more than 100,000 acre-feet per annum of the waters of said stream and its tributaries, and avers that the maximum diversion which can be made through said tunnel, or the irrigation system in aid thereof, does not and cannot exceed 70,000 acre-feet annually from the run-off of said stream, which run-off amounts to about 800,000 acre-feet annually. Defendant denies that there has been diverted in any manner within the State of Colorado, for application to a beneficial use within the drainage basin of said river and its tributaries, a larger amount of water than was necessary to the appropriations made prior to the acquired rights of complainant and its citizens. Defendant avers that at no time has a greater amount of water been diverted from said stream for application to a beneficial use within the State of Colorado than the appropriations within the State of Colorado called for. and that at such time there was ample water in said stream to satisfy such appropriations and all prior appropriations within the State of Wyoming. Defendant avers that the State of Colorado is the owner of all waters within said State of Colorado, with the full right to dispose of them as it may choose, and denies that such rights are subject to the rights acquired by the complainant and its citizens, as alleged in the bill of complaint; avers that it is the right of the defendant commonwealth to dispose of the waters of that portion of said stream lying within the State of Colorado, without let or hindrance by the com-

plainant or its citizens; and defendant avers that the defendant commonwealth can so dispose of the waters of said stream regardless of the prejudice that it may work to the complainant or its citizens within the State of Wyoming, and need give no reason for its will.

II.

Further answering said bill of complaint, this defendant, the State of Colorado, alleges that on the first day of August, 1876, it was admitted into the Union, and then became, and ever since said date has been, and now is, a sovereign state; that within the boundaries of its own territory it possesses the full rights and prerogatives of sovereignty, save as to that portion of power delegated to the federal government by the Constitution of the United States; and that this defendant, the said State of Colorado, is foreign to the State of Wyoming for all but federal purposes; that, being so sovereign within its own territory, it has the plenary and exclusive right and power to control and regulate the use of non-navigable waters within its boundaries, including non-navigable rivers and other streams, and that it has never surrendered this sovereign power over water rights and streams, nor delegated this power, or any portion thereof, to any other sovereign, either national or state.

Defendant further alleges that the territory of the State of Colorado is the apex of the Continental Divide, dividing the waters flowing into the Atlantic and the Pacific, and that streams originating in the mountain heights within the State of Colorado flow

in every direction out of the state; that the origin of these streams is generally near the center of the state, and at no place within the state do any of these streams attain any considerable size in comparison with rivers in the less arid sections of the country; that, owing to the topographical nature of the territory within the State of Colorado, these streams, as a rule, and particularly upon the eastern slope of the Rocky Mountains, after leaving the mountains in which they originate, flow across lands of a nature usually described as plains, and from which, owing to the lack of rainfall, these streams receive no additional supply of water, but, on the contrary, the water in said streams is very rapidly diminished by evaporation and by absorption by the soil through which they pass; that these lands have a soil of unusual fertility, and when irrigated produce crops unexcelled and almost unequalled in quantity and quality.

This defendant alleges that the Laramie River, named in the complainant's bill of complaint, is a stream having its sources within the boundaries of the State of Colorado and flowing within said state for a distance of twenty-seven miles, until it crosses the northern boundary thereof and enters the State of Wyoming; that said river is not navigable within either the State of Colorado or the State of Wyoming, and that the same is not an avenue or instrumentality of interstate commerce as between the States of Colorado and Wyoming. The use of the waters of said stream by diversion thereof, and application of the same upon lands within the territorial limits of the State of Colorado, is essential to the life and well-being of the inhabitants of a large

area within Colorado, and the right of continued use of the said waters is as vital to the inhabitants of the lands upon which said waters are to be applied as is the land itself. This defendant alleges that the jurisdiction and rights of the State of Wyoming, either in its sovereign capacity or as a proprietor of lands, and the rights of the citizens of Wyoming, do not extend into the State of Colorado, and this defendant further alleges that, under the laws and principles of international and interstate law, the sovereign rights of this defendant over the waters of the section of the Laramie River and its tributaries lying within the State of Colorado are not subservient to the sovereignty or rights of the State of Wyoming, and that the State of Wyoming has no dominant estate, rights, or jurisdiction as against this defendant, or its people, in that part of the Laramie River and its tributares flowing in the State of Colorado, and that the State of Colorado cannot be subjected to the burden of arresting its development, or of denying to its inhabitants the use of an element which nature has supplied entirely within its own territory, and without which, and the free use thereof, the lands to which said water is sought to be applied would be uninhabitable.

III.

This defendant, further answering the bill of complaint, says that the Laramie River and certain of its tributaries rise within the State of Colorado; that the drainage area thereof within the State of Colorado is about 428 square miles, and that the

length of the said stream in Colorado is about twenty-seven miles; that the drainage area of said stream and its tributaries within the State of ~~Colorado~~ Wyoming is 3,865 square miles, and that the total drainage area of said stream within the States of Colorado and Wyoming is 4,293 square miles, and that the length of said stream within Wyoming is about 150 miles; that the annual run-off of the sections of said stream lying within the State of Colorado is about 300,000 acre-feet, and that the annual run-off of the sections of said stream lying within the State of Wyoming is about 500,000 acre-feet; that the diversion system, the operation of which is sought to be enjoined herein, taps only the upper sections of said stream and its tributaries lying within the State of Colorado, and only about seventy-five square miles of the said drainage area of 428 square miles lying within Colorado. Further, that said diversion system sought to be enjoined herein cannot divert annually more than 70,000 acre-feet of the annual run-off of 800,000 acre-feet of said stream and its tributaries. Further, that by reason of natural conditions, there cannot be diverted from said stream for said use within the State of Colorado more than 90,000 acre-feet annually. Defendant further alleges that said stream and its tributaries rise in the mountains of Colorado, at an altitude of from about 8,000 to 14,000 feet; that its waters flow through a deep valley and mountain canyons within Colorado, and thence along the same into the section of the stream lying within the State of Wyoming; that the bed of said stream within Colorado is so low that water can only be diverted from the upper sections of said stream and its tributaries

for use in Colorado; and defendant alleges that, under and by the system the operation of which is sought to be enojined herein, and all other practicable means, no more than 90,000 acre-feet annually can be diverted from said stream and its tributaries for use upon lands lying within the State of Colorado.

Defendant avers that long prior to the institution of the present suit, and at a time when all of the diversion from said stream and its tributaries for use within the State of Wyoming did not exceed 50,000 acre-feet, citizens of this defendant and predecessors in title to the co-defendants of this defendant, acting under the authority and by the permission of this defendant, the State of Colorado, diverted from said stream about 8,000 acre-feet annually, and applied the same to irrigation and domestic uses within the watershed of said stream. Defendant further avers that on, to-wit, August 25, 1902, the predecessors in interest of the co-defendants of this defendant conceived an extensive system of irrigation for the conveyance of about 70,000 acre-feet of the run-off of the upper reaches of the said stream to a body of 125,000 acres of rich land, lying in the valley of the Cache la Poudre River in the County of Weld, State of Colorado, and necessary for the reclamation of said body of land; that, in pursuance thereof, and in accordance with the laws of this defendant and by its permission, irrigation rights for said system were initiated by the predecessors in interest of the co-defendants of this defendant, on August 25, 1902, by the commencement of actual construction on said system; and since the last-mentioned date, in further pursuance of said undertaking, a collection system

for gathering the upper water of said river and its tributaries, a reservoir for impounding the same, and a tunnel of about 12,000 feet in length for the carriage of the same through the mountain range constituting the eastern boundary of the watershed of said river and its tributaries, have all been constructed and are now practically completed, at a cost of about $1,200,000. Defendant further avers that, in addition to said expenditure and construction, water rights and other interests, including reservoir sites, have been purchased, and construction work done thereon, at a further cost of about $1,500,000. Defendant avers that said system is practical and will with due diligence be completed. Defendant avers that, in aid of said irrigation system, an irrigation district, the defendant The Greeley-Poudre Irrigation District, a municipal corporation, was formed under the laws of the State of Colorado, embracing about 125,000 acres of land; that bonds for said purpose were voted and issued to the amount of $5,100,000 par value, and made a first lien on the lands of said district, and that a total of about $2,700,000 of said bonds, par value, have been expended in the purchase of water rights and in the construction of said irrigation system. Defendant further avers that about $2,300,000 of said bonds are in the treasury of said district, and are available for the completion of said system.

Defendant avers that, relying upon the diversion of said 70,000 acre-feet annually from said Laramie River and its tributaries, citizens of this defendant have filed upon large bodies of public lands in said district under the homestead and desert land laws of

the United States, and have placed valuable improvements thereon, and are preparing at great expense to make homes thereon; that large bodies of other land in said district have been purchased relying on said diversion from the Laramie River, and valuable improvements have been made on the same; that if the said diversion from the Laramie River is permitted, it will enhance the value of said land about $50,000,000; if denied, it will largely destroy the value of said lands, and will defeat the acquisition of title to all of said lands filed upon under the desert land laws of the United States. Defendant further avers that at the time of the initiation of the irrigation rights, the exercise of which is sought to be enjoined in this proceeding, there was, and after this proposed diversion is made will be, abundant water left in the Laramie River and its tributaries to supply all the irrigation rights in the State of Wyoming which had their origin prior to the inception of the rights, the exercise of which is sought to be enjoined herein. The defendant further avers that the lands within the State of Wyoming, to the irrigation of which the water of the Laramie River and its tributaries has been applied and can be applied, are greatly inferior in productiveness to the lands within the State of Colorado to which the waters herein involved will be applied; and, further, that the lands within the State of Wyoming, in addition to being non-productive, require a greatly increased quantity of water over the necessities of the lands in the State of Colorado for their irrigation; and, further, that the application of water thereto—that is, to the lands

within the State of Wyoming—will produce less returns.

This defendant, having now fully answered all the allegations in plaintiff's bill of complaint, or so much thereof as the defendant is advised ought to be answered, asks to be hence dismissed with costs and charges in this behalf sustained.

NUMBER 5 - ORIGINAL

IN EQUITY

THE STATE OF WYOMING,
COMPLAINANT,

vs.

THE STATE OF COLORADO, The Greeley-Poudre Irrigation District, and The Laramie-Poudre Reservoirs and Irrigation Company,
DEFENDANTS.

SUPPLEMENTAL BRIEF ON BEHALF OF DEFENDANTS

PRELIMINARY STATEMENT.

This is an original proceeding between two states of the Union, each asserting sovereign rights.

The defendant Irrigation District is a public corporation organized under the laws of Colorado for the reclamation of a portion of the arid lands of the state by means of a large irrigation system theretofore owned by the defendant Irrigation Company,

a Colorado corporation, engaged in the completion of the system for the defendant Irrigation District.

This suit involves the diversion and use by Colorado and its citizens, for the necessary reclamation of arid lands, of a portion of the waters of that branch of the Laramie River which rises and flows within the State of Colorado.

The Laramie River is an interstate stream, rising and flowing in both Wyoming and Colorado. The diversion complained of is from the southerly or Colorado branch of the stream. The topographical conditions are such that the tunnel project here complained of defines the limit of maximum diversion from the Colorado branch of the river for use in that State. Colorado can never take more than 91/250 of the waters of the branch of the stream rising within the territorial limits of the State, by means of the tunnel project and all other existing diversions, and a greater portion of the waters rising in Colorado must for all time flow into the State of Wyoming, there to increase the supply from the Wyoming branches of the stream, for the use and benefit of Wyoming and its citizens.

The Laramie River in turn is one of many branches or tributaries of the North Platte River, the northerly branch of the Platte River, which unites with the southerly branch, the South Platte River, at North Platte, Nebraska.

(See Map, Exhibit 1, attached to the answer of the corporation defendants.)

The greater portion of the waters of both branches of the Platte River rise within the State of Colorado, and the diversion complained of is from the head-waters of one branch of the stream for use in the reclamation of land situate within the drain-

age of another branch of the same stream. The waters have their origin, and diversion and application occur within the State of Colorado.

Wyoming asserts the right, both as the owner of lands within the drainage area of the Laramie River and also because of alleged prior appropriations of water from the stream within that State by its citizens, to the undiminished flow of the waters which rise and flow in Colorado, as well as those waters which have their source within Wyoming. She denies to Colorado the right to divert and use a portion of the waters rising in that State by means of a system of ditches leading to a tunnel through the mountain range which forms the easterly border of the drainage area of the Colorado branch of the stream, for use upon lands lying within a neighboring drainage. Wyoming also asserts that, as a State, she has the right to an undiminished flow of the waters of the Colorado branch of the Laramie River for the use and benefit of the citizens of Wyoming, and prays that Colorado and appropriators within that State be enjoined from making the diversions of which complaint is made.

Colorado, by answer, denies that this diversion of a portion of the waters of the stream within its borders will injure Wyoming or its citizens, or that the waters of the Colorado stream were appropriated by citizens of Wyoming prior to the initiation of the Colorado enterprise complained of, and alleges that after the Colorado diversions shall have been made there will yet remain ample water in the stream to satisfy all prior appropriations by citizens in Wyoming. Colorado avers that the waters of the Laramie River constitute a natural resource of the State; that it is the owner of all waters within its borders, and that it has full right to utilize the same for its

own necessities and those of its people, and that it may dispose of them as it may choose; denies that the right to divert and use the waters of its stream is to any extent affected by, or subject to, the laws of Wyoming or any other sovereignty or is subject to the rights acquired by complainant and its citizens as in the bill of complaint alleged; and avers that Colorado has the right to use and dispose of the waters of that portion of the stream rising and flowing within its borders, without let or hindrance and regardless of any prejudice it may work to complainant or its citizens, and that it need give no reason for its will.

Colorado further alleges its admission as a State of the Union August 1, 1876; that within the boundaries of its own territory it possesses the full rights and prerogatives of sovereignty, save as delegated by the Constitution to the United States; that Colorado is foreign to Wyoming for all but federal purposes; that being so foreign, within its own territory, it has the plenary and exclusive right and power to control and regulate the use of non-navigable waters; and that it has never surrendered the sovereign power over water rights or streams, or any portion thereof to any other sovereignty, either national or state; that the territory of Colorado is the apex of the continental divide; that its streams originate in its mountain heights, and from thence flow in all directions into lower states; that these streams have an ever-diminishing flow out across arid plains of unusual fertility and productivity when supplied with water for irrigation, but that the waters of these streams are inadequate to supply the needs of its lands; that the portion of the Laramie River in Colorado is non-navigable, has its source within the boundaries of the State and flows therein for a distance

of 27 miles until it enters Wyoming; that the use of the waters of the stream by the diversion and application thereof upon lands within the territorial limits of Colorado is essential to the life and well-being of the State and the inhabitants of a large area thereof, and that the right of continued use of such water is as vital to the inhabitants of the lands upon which such waters are to be applied as is the land itself; that the jurisdiction and rights of Wyoming, either in its sovereign capacity or as a proprietor of lands, and the rights of its citizens, do not extend into Colorado, and that under the laws and principles of international and interstate law the sovereign rights of Colorado over the section of the Laramie River and its tributaries rising and flowing within the State are not subservient to the sovereignty or rights of Wyoming; that Wyoming has no dominant estate or jurisdiction in or against Colorado or its people in that part of the river and its tributaries flowing in Colorado; and that Colorado cannot be subjected to the burden of arresting its development by denying to its inhabitants the use of an element which nature has supplied entirely within its own territory, and without which and the use thereof, the lands to which said water is to be applied would be relatively valueless. Colorado further alleges that the average annual run-off from that portion of the stream within her borders is about 300,000 acre feet, and that the annual run-off of the section of the stream within Wyoming is about 500,000 acre feet; that the irrigation system, the operation of which is sought to be enjoined, diverts water from but a small section of the stream and its tributaries lying within Colorado, and that by means of said system Colorado cannot divert more than 70,000 acre feet out of the 300,000 acre feet of the annual run-off of the Colorado sec-

tion of the stream and its tributaries; and, further, that by reason of natural conditions, no more than 90,000 acre feet per annum of the water of the stream can ever be diverted by Colorado for use upon lands lying within the State.

Further, that long prior to the initiation of the present suit, that is to say, on August 25, 1902, when diversions from the entire stream and its tributaries for use within Wyoming did not exceed 50,000 acre feet per annum, predecessors in interest of the corporate defendants commenced construction of the irrigation system complained of for the necessary reclamation of 125,000 acres of rich but arid land lying in the valley of the Cache la Poudre River in Colorado, and that the tunnel through the mountain range and a large part of the mountain diversion canals of the system have been practically completed at a cost of about $1,200,000. That in aid of said irrigation system defendant Irrigation District was organized under the laws of Colorado and thereafter issued bonds in the amount of $5,100,000 for the purpose of purchasing and completing said irrigation system, and that about $2,700,000 of the bonds of said district have been expended in the purchase of water rights and the completion of said irrigation system; that relying upon the diversion of a portion of the waters of the Laramie River and its tributaries in Colorado by means of the tunnel system, citizens have filed upon large bodies of public lands therein under the laws of the United States and have placed valuable improvements and homes thereupon; and that if said diversion is permitted it will enhance the value of the lands within the irrigation district about $50,000,000, but if denied it will largely destroy the value of said lands and also defeat the

acquisition of title to large areas thereof under the public land laws of the United States.

Colorado further avers that at the time of the initiation of the irrigation enterprise complained of there was, and, if the proposed diversion shall be made there will be, abundant water remaining in the Laramie River and its tributaries to supply all the lands in Wyoming claiming water from said stream under rights which had their origin prior to the commencement of the Colorado enterprise; that the lands within Wyoming to the irrigation of which the water of the Laramie River and its tributaries has been and can be supplied are greatly inferior in productiveness to the lands in Colorado to which the waters herein involved will be applied; and that a greater quantity of water will be used upon the Wyoming lands than upon a like area in Colorado, and that the same quantity of water would produce less returns when applied to Wyoming lands than if applied to lands in Colorado; and that Colorado by diverting a portion of the waters of the river within her borders is not unreasonably exercising her right as a state so to do, and prays that the complaint be dismissed.

The corporate defendants filed like answer and further, after denying the claims of Wyoming, justified their acts under the Constitution and laws of Colorado and claim that in making the diversion complained of they are acting under the authority and with the approval of the defendant State, and that in so doing they are exercising, with the approval of the State, one of its inalienable and sovereign rights, that is, the right to avail itself, through its citizens, of one of its great natural resources; that construction of the enterprise complained of was commenced August 25, 1902, and that since hitherto

the corporate defendants and their predecessors have diligently pursued the work of construction and completion thereof; that about $2,700,000 of bonds of the irrigation district have been sold to innocent purchasers for value throughout the United States and the proceeds thereof expended upon purchase and completion of said irrigation system; that the payment of said bonds is dependent upon diversion and use of water from the Laramie River; that defendant Irrigation Company, as prior owner of said irrigation system, has contracted to complete the same for the defendant Irrigation District; that said irrigation system will never be able to divert more than 70,000 acre feet of water from the Colorado portion of the Laramie River, and that it is impossible, owing to natural physical conditions, to divert within the State of Colorado, by this and all other irrigation systems, more than 90,000 acre feet of water per annum and that the run-off of said stream and its tributaries furnishes abundant water to satisfy all appropriations in Wyoming earlier in date than those sought to be enjoined herein even after the defendant Irrigation District shall have diverted all available waters by its irrigation system.

Evidence was taken and case presented both on brief and by oral argument December, 1916. Defendants file this suplemental brief pursuant to order for reargument entered herein.

For greater convenience we separate this brief into two volumes: **VOLUME I** is devoted to a discussion of the law of the case, **VOLUME II** to the facts.

ORDER FOR REARGUMENT.

The order restoring this case to the docket for reargument provides:

> "1. Counsel are requested to specially direct their attention to the rule which they deem should properly be applied to a solution of the controversy for decision: That is, whether the rights asserted are to be tested and determined solely by the application of the general principles of prior appropriation, without regard to state boundaries, or whether, on the contrary, the general principles of prior appropriation are subject to be restricted or their operation limited in this case by state lines, and if so, by what principles, under that assumption, the case is to be controlled.
>
> 2. They are moreover requested not merely by generalizations to state the facts relied upon, but specifically, by careful reference to the pages of the record, and to group them under the various propositions relied upon, including the extent of the use of water in both states when the work complained of was begun and when this suit was commenced, and the extent of appropriation made or authorized in either or both states since its commencement.
>
> 3. In view of the legislation of Congress concerning reclamation and the extensive public works which have been constructed under that legislation and the possible consequences which may result from the rule to be applied in the solution of this controversy, the clerk is instructed to notify

the Attorney General of the United States of this order for reargument."

We shall confine ourselves to discussion of the first two paragraphs or subdivisions of the order.

We feel that the third paragraph calls for a statement from the United States in the first instance and we should not anticipate their position but rather make reply, if occasion so requires.

The first two paragraphs naturally subdivide the discussion into (I) the law of interstate water rights and (II) the facts of this particular case. We shall deal with each of these in their order and separate volumes.

PART I.

THE LAW OF INTERSTATE WATER RIGHTS.

This subdivision demands more than limited notice and citation of authorities.

In order that we may be of any aid to the court in ascertaining the rule of law which shall govern this and similar cases, we must undertake a thorough and exhaustive treatment of the fundamental principles of state and national government, the relations of the states to one another, and the relation of the individual to the state. We realize that the rule of interstate law to be announced in this case may affect not alone Wyoming and Colorado, in their realtions one to the other, but more important still, may control the future relation of the states one to the other and to the United States.

The continued development of our resources, and the growing demands of our citizens and of each of the states must, from time to time in the future, call

for adjustment of controversies between the states which, under the law of nations, treaty or arbitration failing, would be determined by the sword. With this situation before us we shall not limit our presentation of the law to that which we believe should govern this particular case but rather to the broader field of interstate law governing the relation of all the states of the Union in their full or limited jurisdiction over waters within their borders.

1. STATES—NOT INDIVIDUALS—INVOLVED.

Here the rights of two states of the Union are involved and all individual citizens of either and the private rights or claims of any thereof, are necessarily included within whatever rights the respective states may be held to possess.

The State of Colorado and The Greeley-Poudre Irrigation District, a public corporation of Colorado, diverting and applying the waters of the Laramie river through the tunnel system here involved, and The Laramie-Poudre Reservoirs and Irrigation Co., a Colorado corporation previously owning and engaged in construction of the tunnel irrigation system and contracting to complete the same and turn it over to the irrigation district, are parties defendant. The character of parties is the same as in Kansas v. Colorado (185 U. S. 125, 206 U. S. 46). In that case Mr. Justice Brewer observed:

> "While several of the defendant corporations have answered, it is unnecessary to specially consider their defences, for if the case against Colorado fails it fails also as against them."
>
> Kansas v. Colorado, 206 U. S. 46, 85.

Whatever the rights of these corporate defendants may be, the controversy is one between two sov-

ereign states (Wyoming and Colorado) and whatever rights the corporate defendants may have or claim, are necessarily included within the greater rights of Colorado. For,

> "The creature cannot rule the creator."
> 206 U. S. 46, 85.

and the controversy rises above a mere question of local private interest or adjustment of private property rights of citizens of the two states, and is such a controversy as would obtain between independent nations.

> Missouri v. Illinois, 180 U. S. 208; 200 U. S. 496;
> Kansas v. Colorado, 185, U. S. 125; 206 U. S. 46;
> Richey Land & Cattle Co. v. Miller & Lux, 218 U. S. 258.

In fact, were not such the case, the action would, no doubt, have been dismissed on demurrer.

In determining rights between states, private property rights of citizens of each become of secondary importance, the controversy presents itself along broader lines of sovereign rights and powers of the states under whose jurisdiction the citizen obtains and enjoys his private property and the decision determining the rights of the state necessarily includes those of the private citizens. As well said by Mr. Justice Brewer in *Kansas v. Colorado:*

> "Here is a dispute of a justiciable nature which might and ought to be tried and determined. If the two states were absolutely independent nations it would be settled by treaty or by force. Neither of these ways being practicable, it must be settled by decision of this court.

It will be perceived that Kansas asserts a pecuniary interest as the owner of certain tracts along the banks of the Arkansas and as owner of the bed of the stream. We need not stop to consider what rights such private ownership of property might give. * * *

It is the state of Kansas which invokes the action of this court, charging that, through the action of Colorado, a large portion of its territory is threatened with disaster. * * * It is not acting directly and solely for the benefit of any individual citizen to protect his riparian rights. Beyond its property rights it has an interest as a state * * *. Its prosperity affects the general welfare of the state.

The controversy rises therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint. Georgia v. Tennessee Copper Co., 206 U. S. 230.

This changes in some respects the scope of our inquiry. It is not limited to the simple matter of whether any portion of the waters of the Arkansas is withheld by Colorado. We must consider the effect of what has been done upon the conditions in the respective states, and so adjust the dispute upon the basis of equality of rights as to secure as far as possible to Colorado the benefits of irrigation without depriving Kansas of the like beneficial effects of a flowing stream."

Kansas v. Colorado, 206 U. S. 46, 98.

In the language of Mr. Justice Holmes:

"The case has been argued largely as if it were one between two private parties; but it is not * * *. This is a suit by a state for an injury to it in its capacity of a quasi-sovereign. In that capacity the state has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain. * * * When the states by their union made the forcible abatement of outside nuisance impossible to each, they did not thereby agree to submit to whatever might be done. They did not renounce the possibility of making reasonable demands on the ground of their still remaining quasi-sovereign interests. An alternative to force is a suit in this court.

The states by entering the union, did not sink to the position of private owners, subject to one system of private law. This court has not quite the same freedom to balance the harm that will be done by an injunction against that of which the plaintiff complains, that it would have in deciding between two subjects of a single political power. * * * It is a fair and reasonable demand on the part of a sovereign that the air over its territory shall not be polluted * * *. If any such demand is to be enforced this must be notwithstanding the hesitation that we might feel if the suit were between private parties."

Georgia v. Tennessee Copper Co., 206 U. S. 230, 237-238.

As previously noted, The Greeley Poudre Irrigation District is a public corporation of Colorado

organized for the purpose of completing the enterprise theretofore undertaken by the other corporate defendant, and of using a relatively small portion of the waters of the Laramie river (as it rises and flows in Colorado) for the irrigation of part of the arid lands of the state. As such it is an agency of the state and whatever powers or rights it may possess it derives from the state. It is similar in this respect to the Sanitary District of Chicago, whose position was thus defined by Mr. Justice Shiras:

> "The averment and conceded facts are that the corporation is an agency of the state to do the very things which, according to the theory of the complainants' case, will result in the mischief to be apprehended. It is state action and its results that are complained of * * *."
>
> Missouri v. Illinois, 180 U. S. 208, 242.

As observed by Mr. Justice Holmes in a suit involving the private property interests of citizens in different states:

> "But whatever this court may decide, if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state."
>
> Rickey Land & Cattle Co. v. Miller & Lux, 218 U. S. 258, 261.

Such being the nature of the controversy, we shall consider property rights of private citizens to the use of waters of flowing streams (within the state) to the better ascertain the greater rights of the state itself. The law of states, not individuals, is here involved and we shall but incidentally refer to rules of private usufructuary property of citizens.

II. INDEPENDENT NATIONS — THEIR DIGNITY AND EQUALITY—THEIR RELATION TO ONE ANOTHER AND THE RELATION OF THE CITIZEN TO THE STATE.

Nations have absolute dominion of everything within their boundaries, including the rivers, streams and waters therein, unless voluntarily surrendered, and the individual property rights of the citizen are only such as the State may grant him. The citizen and his property rights are at all times inferior and subordinate to the state or nation.

Vattel in his "Law of Nations" (1872 Ed. Chitty) thus defines the rights of independent nations; their dignity and equality, their relation to one another, to their own citizens and to the citizens of one another;—and the relation of the citizen to the state in his property rights:

> "Every nation, every sovereign and independent state, deserves consideration and respect, because it makes an immediate figure in the grand society of the human race, is independent of all earthly power, and is an assemblage of a great number of men, which is, doubtless, more considerable than any individual. The sovereign represents his whole nation; he unites in his person all its majesty. No individual, though ever so free and independent, can be placed in competition with a sovereign; this would be putting a single person upon an equality with a united multitude of his equals. Nations and sovereigns are, therefore, under an obligation, and at the same time have a right, to maintain their dignity, and to cause it to be respected, as being of the utmost importance to their safety and tranquility.

We have already observed that nature has established a perfect equality of rights between independent nations. Consequently, none can naturally lay claim to any superior prerogative; for, whatever privileges any one of them derives from freedom and sovereignty, the others equally derive the same from the same source." (pp. 148-9.)

"It is a settled point with writers on the *natural* law, that all men inherit from *nature* a perfect *liberty* and *independence*, of which they cannot be deprived without their own consent. In a state, the individual citizens do not enjoy them *fully* and absolutely, because they have made a *partial* surrender of them to the sovereign. But the body of the nation, the state, remains absolutely free and independent with respect to all other men, and all *other* nations, as long as it has not voluntarily submitted to them." (p. 53.)

"We have explained how a nation takes possession of a country, and at the same time gains possession of the domain and government thereof. That country, everything included in it, becomes the property of the nation in general. Let us now see what are the effects of this property, with respect to other nations. The full domain is necessarily a peculiar and exclusive right; for, if I have a full right to dispose of a thing as I please, it thence follows that others have no right to do it at all, since if they had any, I could not freely dispose of it. The private domain of the citizens may be limited and restrained in several

ways by the laws of the state, and it always is so by the eminent domain of the sovereign; but the general domain of the nation is full and absolute; since there exists no authority upon earth by which it can be limited; it therefore excludes all right on the part of foreigners. And, as the rights of a nation ought to be respected by all others, none can form any pretensions to the country which belongs to that nation, nor ought to dispose of it without her consent, any more than of the things contained in the country.

The domain of the nation extends to everything she possesses by a just title; it comprehends her ancient and original posessions, and all her acquisitions made by means which are just in themselves, or admitted as such among nations,—concessions, purchases, conquests made in the regular war, etc. And by her possessions we ought not only to understand her territories, but all the rights she enjoys.

Even the property of the individuals is, in the aggregate, to be considered as the property of the nation, with respect to other states. It, in some sort, really belongs to her, from the right she has over the property of her citizens, because it constitutes a part of the sum total of her riches, and augments her power. She is interested in that property by her obligation to protect all her members. In short, it cannot be otherwise, since nations act and treat together as bodies in their quality of political societies, and are considered as so many moral persons.

All those who form a society, a nation being considered by foreign nations as constituting only one whole, one single person all their wealth together can only be considered as the wealth of that same person. And this is so true, that each political society may, if it pleases, establish within itself a community of goods, as Campanella did in his republic of the sun. Others will not inquire what it does in this respect; its domestic regulations make no change in its rights with respect to foreigners nor in the manner in which they ought to consider the aggregate of its property, in what way soever it is possessed." (pp. 163-4.)

In the early case of *Schooner Exchange v. McFadden,* Chief Justice Marshall thus defined the jurisdiction of a nation within its own territory.

"The jurisdiction of the nation within its own territory is necessarily exclusive and absolute. It is susceptible of no limitation not imposed by itself. Any restriction upon it, deriving validity from an external source, would imply a diminution of its sovereignty to the extent of the restriction, and an investment of that sovereignty to the same extent in that power which would impose such restriction. All exceptions, therefore, to the full and complete power of a nation, within its own territories, must be traced up to the consent of the nation itself. They can flow from no other legitimate source."

Schooner Exchange v. McFaddon, 7 Cranch. 116, 136.

In *Rhode Island v. Massachusetts* (1838) Mr. Justice Baldwin said:

"Neither state can have any right beyond its territorial boundary. It follows, that when a place is within a boundary, it is a part of the territory of a State; title, jurisdiction, and sovereignty are inseparable incidents, and remain so till the State makes some cession. * * * 'The jurisdiction of a State is co-extensive with its territory, co-extensive with its legislative power.' * * Whether the sovereignty of the United States, of a State, or the property of an individual, depends on the locality of a tree, a stone, or watercourse; whether the right depends on a charter, treaty, cession, compact, or a common deed; the right is to territory great or small in extent, and power over it, either of government or private property; the title of a State is sovereignty, full and absolute dominion; 2 Pet. 300, 301; the title of an individual is such as the State makes it by its grant and law."

Rhode Island v. Massachusetts, 12 Pet. 657, 733-4.

Vattel thus speaks of rivers, streams and lakes:

"When a nation takes possession of a country, with a view to settle there, it takes possession of everything included in it, as lands, lakes, rivers, etc."

He then treats of the various uses of rivers and the relations of the State and citizens thereto and continues:

"What we have said of rivers and streams, may be easily applied to lakes. Every lake, entirely included in a country, belongs to the nation that is the proprietor of that country; for in taking possession of

a territory a nation is considered as having appropriated to itself everything included in it; and, as it seldom happens that the property of a lake of any considerable extent falls to the share of individuals, it remains common to the nation. * * * The empire or jurisdiction over lakes and rivers is subject to the same rules as the property of them, in all of the cases which we have examined. Each State naturally possessed it over the whole or the part of which it possesses the domain. We have seen that the nation, or its sovereign, commands in all places in its possession."

Vattel's Law of Nations (1872 Edition), 120, 123, 125.

III. STATES OF THE UNITED STATES INDEPENDENT NATIONS, SAVE FOR POWERS SURRENDERED TO THE UNITED STATES.

Each state of the Union, new or original, has the same unlimited jurisdiction over all persons and things, within its territorial limits, as any foreign nation, where that jurisdiction has not been surrendered to the United States by the Constitution. This rule has been so frequently announced and confirmed by this court that limited citation will for the present suffice.

The many cases dealing with state jurisdiction over waters, next to be reviewed, are likewise authority for this fundamental principle of our government.

In the early case of *New York v. Miln*, Mr. Justice Barbour thus defines the sovereignty of a state of the United States:

"That a state has the same undeniable and unlimited jurisdiction over all persons

and things, within its territorial limits, as any foreign nation where that jurisdiction is not surrendered or restrained by the Constitution of the United States. That, by virtue of this, it is not only the right, but the bounden and solemn duty of a state, to advance the safety, happiness and prosperity of its people, and to provide for its general welfare, by any and every act of legislation, which it may deem to be conducive to these ends; where the power over the particular subject or the maner of its exercise is not surrendered or restrained, in the manner just stated."

New York v. Miln, 11 Pet. 102, 139.

In *Chisholm v. Georgia*, 2 Dall. 419, 435:

"Every state in the Union, in every instance where its sovereignty has not been delegated to the United States, I consider it to be as completely sovereign as the United States are in respect to the powers surrendered. The United States are sovereign as to all the powers of government actually surrendered. Each state in the Union is sovereign as to all the powers reserved. It must necessarily be so, because the United States have no claim to any authority but such as the states have surrendered to them. Of course the part not surrendered must remain as it did before."

In *Texas v. White*, 7 Wall. 700, 725:

"But the perpetuity and indissolubility of the Union, by no means implies the loss of distinct and individual existence, or of the right of self-government by the states. Under the Articles of Confederation each

state retained its sovereignity, freedom, and independence, and every power, jurisdiction, and right not expressly delegated to the United States. Under the Constitution, though the powers of the states were much restricted, still, all powers not delegated to the United States, nor prohibited the states, are reserved to the states respectively, or to the people. And as we have already had occasion to remark at this term, that 'the people of each state compose a state, having its own government, and endowed with all the functions essential to separate and independent existence,' and that 'without the states in union, there could be no such political body as the United States.' (Citing County of Lane v. State of Oregon, 7 Wall. 76.) 'Not only, therefore, can there be no loss of separate and independent autonomy to the states, through their union under the Constitution, but it may be not unreasonably said that the preservation of the states, and the maintenance of their governments, are as much within the design and care of the Constitution as the preservation of the Union and the maintenance of the National Government. The Constitution, in all its provisions, looks to an indestructible Union, composed of indestructible states.''

Taylor on International Law, Sec 124;
1st Wharton Dig. International Law, Sec. 1;
Pennoyer v. Neff, 95 U. S. 722.

As we shall next observe, in the many authorities we shall review, no surrender is made of the un-

limited jurisdiction of each of the states over the rivers, streams and waters within its boundaries, save for regulation of navigation. This is thus reannounced and affirmed by Mr. Justice Brewer:

> "We have within our borders extensive tracts of arid lands which ought to be reclaimed, and it may well be that no power is adequate for their reclamation other than that of the national government. *But if no power has been granted, none can be exercised.* * * * While arid lands are to be found mainly, if not only, in the Western and newer states, yet the powers of the national government within the limits of those states are the same (no greater and no less) than those within the limits of the original thirteen; and it would be strange if, in the absence of a definite grant of power, the national government could enter the territory of the states along the Atlantic and legislate in respect to improving, by irrigation or otherwise, the lands within their borders. * * *
>
> It is enough for the purposes of this case that *each state has full jurisdiction over the lands within its borders, including the beds of streams and other waters.*" (Italics ours.)
>
> Kansas v. Colorado, 206 U. S. 46, 93.

All laws for regulation and control of uses of or usufructuary titles in water necessarily come from some law making sovereign power, state or national, and a more extensive review of the authorities upon the jurisdiction of the states over the waters within their borders is necessary before proceeding to a

discussion of the doctrine of prior appropriation as one of local, not interstate law.

IV. JURISDICTION OF STATES OF THE UNITED STATES OVER THE STREAMS AND WATERS WITHIN THEIR BORDERS.

Analytical treatment of the general subject of the jurisdiction of each state of the Union over the use of waters within its domain and the acquisition by the citizen of usufructuary titles therein, subject at all times to the paramount title of the state, would doubtless lead to a clearer discussion; but we are confronted at the very threshold with such an abundance of authority and such a wealth of precedent and discussion, involving necessarily the individual methods of treatment by each jurist and author, that so to subdivide the discussion, would necessitate so frequent duplication and repetition as to tire and annoy and thus make sacrifice of the benefits otherwise gained. We shall accordingly treat the subject generally, rather than in specific subdivisions, quoting more liberally than we would were the subject of less importance.

A comprehensive discussion necessarily involves consideration of the fundamental principles of government, the rights and powers of independent states and of states of the United States, in their relations not alone to their own citizens and the citizens of other states, but more essentially to each other and to the United States. The power to regulate the use of waters within its domain must necessarily rest with the state, unless in some manner limited by voluntary surrender of all or some portion of such power to the other states or to the United States in the Constitution.

(1) GENERAL STATEMENT.

At the outset, rather than in conclusion, we find that the authorities with remarkable unanimity announce and affirm certain general principles and conclusions which may be summarized as follows:

Each nation has jurisdiction and sovereign control over the waters of the flowing streams within its domain. Each of the original thirteen states of the United States possessed all of the powers of separate nations at the time of the formation of the Union. After the Union each of these original states retained and thereafter continued to exercise all of such rights, powers and jurisdiction formerly held, save as surrendered to the United States by the Constitution. Each of the original thirteen states, before the Constitution, was in all respects equal with the other independent states and each had the same sovereign powers of independent nations. After the adoption of the Constitution each state continued equal in all respects with all the rest. Each of the new states was admitted to the Union on an absolute equality with the original thirteen states and was and is possessed of the same powers and jurisdiction over the streams within its borders as were retained by the original states at the time of the adoption of the Constitution. Each state, old or new, stands upon an equality with all of the rest and the powers of the new states are no less and no greater than those of the original thirteen.

Whatever sovereign jurisdiction the United States may have exercised over the territories, upon admission to the Union, the sovereign powers theretofore exercised by Congress over the territories ceased to exist and passed to the new states upon admission. This sovereign jurisdiction extended to the

waters and streams within their borders to the same degree as with the original thirteen states. This control of the streams included the right to determine the use that may be made of the waters of the state by its citizens whether for navigation (except as delegated to Congress), fisheries, power, municipal supply, and domestic, irrigation, or any other use necessary to the state or its citizens according to the varying demands and conditions of the territory included within each of the new states, including the right to fix by local laws, rules and regulations the extent to which a usufructuary property in such waters may be obtained and enjoyed and the class of property owners (i. e., riparian, non-riparian, etc.) who may so possess and enjoy the use thereof, subject at all times to the greater right of the sovereign control remaining within the state. The uses thus recognized as limited property rights in the citizens of the respective states, and, so controlled by the conditions obtaining, have been determined by each state according to its own necessities and fixed by its local laws and decisions, and the United States and its courts have adopted the state laws, regulations and court decisions as the rules controlling within their respective jurisdictions.

No power was delegated to congress to determine the laws, rules or methods of use that should apply within the states and Congress, wherever it has legislated upon the subject with respect to public lands, has not only refused to infringe upon the powers of the states, but has specifically recognized the local laws, customs and court decisions as controlling upon the regulation of the streams within the states.

In the exercise of jurisdiction of the streams within their borders, each of the states of the Union

has fixed its own methods of regulation and control, varying to a greater or less degree in each thereof, according to the varied local conditions and necessities. In the states where irrigation is unnecessary, usufructuary titles under the common law rule of riparian rights have been recognized and permitted to a limited number of citizens (the owners of land bordering upon the streams) to the exclusion of other citizens, and even in such states the rules announced and the limits to the exercise of the usufructutary rights have varied in each of such states according to the local conditions and the necessities of the state and its people. In other states where the rainfall is insufficient to supply the necessities of the state and its citizens, usufructuary titles to the waters of the streams have been permitted to a limited class of citizens (viz.: the first appropriator for use on any lands, riparian or non-riparian, according to the extent of his beneficial use) under the arid region doctrine of appropriation. While in still others combining both humid and arid natural conditions (as California, Nebraska, etc.) usufructuary titles have been recognized under both the common law doctrine of riparian rights and the arid region doctrine of appropriation; and in all the states of the Union the doctrines, varied by local conditions, have been from time to time modified, enlarged or restricted according to the necessities obtaining, to such a degree that in no two of the states adopting a given general rule or combination of rules, are the laws, decisions or manner of regulating these usufructury rights identical.

An extended review of the history of the development of the law of waters of each of the states reveals an ever changing progression conforming to the conditions there prevailing, written by legisla-

tion and decisions of her courts and varying or departing to a greater or less degree, especially in the application of the fundamental principles, from the rules of similar states where like conditions generally obtain (for example, the variance between the application of the common law doctrine in New Jersey and California, California and Oregon, Oregon and Nebraska, or the variance in the application of the arid region doctrine in Nevada and Wyoming, and Wyoming and Colorado).

Finally each state has the right to adopt laws of her choice and thereafter to alter, enlarge or modify the same according to her conditions and her necessities and those of her people. Irrespective of the distinguishing features of the laws of each of the states the one predominant feature remains that all of the states have from the first history of the United States executed full control, save as surrendered in the federal Constitution, over the waters within their borders, and no state has imposed or could, if she would, impose her doctrines upon her neighbor and Congress cannot enforce any doctrine upon any state or group of states. Each state has at all times jealously guarded her paramount and sovereign powers and title over the waters within her borders and has at all times limited the enjoyment of this her ofttimes greatest natural resource, to usufructuary uses to only limited numbers of her citizens for the development of such limited portions of her area as would best serve the state and all her people. In humid states she has with equality recognized the usufructuary rights of riparian owners and excluded, to a greater or less degree, all others not included within this particular class. In arid states she has limited the beneficial use of her waters to the first to make use thereof, without respect to the location of the

lands, to the exclusion of those who subsequently desired the same; and at all times in her paramount and reserved right and power, she had modified, enlarged or restricted her rules and doctrines to suit her local conditions and growing necessities.

(2) DISCUSSION OF AUTHORITIES—STATE JURISDICTION OF WATERS.

From the abundance of authority, we shall confine ourselves primarily to a discussion of and citations from the decisions of this Court and of other Federal courts, and shall refrain from reference to numerous decisions of State courts, except where properly involved in the consideration of some decision of this Court or, in a few instances, where decisions of this Court have been relied upon by the state courts in applying the principles here involved. But limited reference will be made to accredited authors and then only for brevity and to avoid unduly prolonging the quotations from decisions, already extended out of ample caution and a consideration of the importance of the subject.

While an arrangement of authorities in groups according to the principles involved, might, to some degree, be more satisfactory, nevertheless we have preferred to follow the history of interpretation of the law of state jurisdiction of waters in the order of announcement by the courts of the land. We shall refer to national legislation in a separate and subsequent portion of this brief.

(a) Decisions of the Courts.

From the earliest decisions of this court to the present time, all uses of water for navigation, fisheries, power, domestic, irrigation and other beneficial purposes have been treated as within the sovereign

jurisdiction and control of the several states of the Union, (save alone for the paramount right of Congress in its control of navigation) and the laws of the states and decisions of their courts, have been universally recognized as controlling, by this court. We shall, therefore, make no distinction by segregation of the cases dealing with the various uses, but shall treat them as governed by one general principle of state control.

Willson vs. The Blackbird Creek Marsh Co. (1829) involved the right of Delaware to permit a Delaware corporation to dam a navigable creek and thereby interfere with navigation. Opinion by Chief Justice Marshall:

> "The act of assembly by which the plaintiffs were authorized to construct their dam, shows plainly that this is one of those many creeks, passing through a deep level marsh adjoining the Delaware, up which the tide flows for some distance. The value of the property on its banks must be enhanced by excluding the water from the marsh, and the health of the inhabitants probably improved. Measures calculated to produce these objects, provided they do not come into collision with the powers of the general government, are undoubtedly within those which are reserved to the States. But the measure authorized by this act stops a navigable creek, and must be supposed to abridge the rights of those who have been accustomed to use it. But this abridgement, unless it comes in conflict with the constitution or a law of the United States, is an affair between the government of Dela-

ware and its citizens of which this court can take no cognizance."

Willson vs. Blackbird Creek Marsh Co. 2 Pet. 245.

Martin vs. Waddell (1842) involved the question of title in certain lands covered with water in New Jersey. Opinion by Mr. Justice Taney:

> "The English possessions in America were not claimed by right of conquest but by right of discovery * * * and the absolute rights of property and dominion were held to belong to the European nation by which any particular portion of the country was first discovered. * * * The discoveries made by persons acting under the authority of the government were for the benefit of the nation; and the crown, according to the principles of the British constitution, was the proper organ to dispose of the public domains; and upon these principles rest the various charters and grants of territory made on this continent."

Of sovereign rights to waters within the borders of the states it is said:

> "When the Revolution took place, the people of each State became themselves sovereign; and in that character hold the absolute right to all their navigable waters and the soils under them for their own common use, subject only to the rights since surrendered by the constitution to the general government."

Martin vs. Waddell, 16 Pet. 367, 409, 410.

Pollard vs. Hagan (1844) involved a question of title in certain lands in Mobile Bay, Alabama,

overflowed at high tide: Opinion by Mr. Justice M'Kinley:

> "And we now enter into its examination with a just sense of its great importance to all the States of the Union, and particularly to the new ones. Although this is the first time we have been called upon to draw the line that separates the sovereignty and jurisdiction of the government of the Union, and the state governments, over the subject in controversy, many of the principles which enter into and form the elements of the question have been settled by previous well considered decisions of this court, to which we shall have occasion to refer in the course of this investigation." (3 How. 212, 220.)

To the argument that the United States derived title from the King of Spain and succeeded to all his rights and jurisdiction over the territory ceded and therefore held the land and the soil under navigable waters according to the laws of Spain,—that Alabama, by her compact with the United States on admission to the Union, agreed that the people of Alabama forever disclaimed all title to unappropriated lands lying within the state and that by such compact the land under navigable waters, as well as the public domain above high water, were reserved to the United States, he said:

> "We think a proper examination of this subject will show that the United States never held any municipal sovereignty, jurisdiction, or right of soil in and to the territory, of which Alabama or any of the new states were formed, except for temporary

purposes, and to execute the trusts created by the acts of Virginia and Georgia legislatures, and the deeds of cession executed by them to the United States, and the trust created by the treaty with the French republic, of the 30th of April, 1803, ceding Louisiana" (page 221).

He then discusses the derivation of title to the territory of Alabama and the legislative acts of the United States and of the states of Georgia and Virginia and says:

> "When the United States accepted the cession of the territory, they took upon themselves the trust to hold the municipal eminent domain for the new States, and to invest them with it, to the same extent, in all respects, that it was held by the States ceding the territories. * * *
>
> When Alabama was admitted into the Union, on an equal footing with the original States, she succeeded to all the rights of sovereignty, jurisdiction, and eminent domain which Georgia possessed at the date of the cession, except so far as this right was diminished by the public lands remaining in the possession and under the control of the United States, for the temporary purpurposes provided for in the deed of cession and the legislative acts connected with it. Nothing remained to the United States, according to the terms of the agreement, but the public lands. And, if an express stipulation had been inserted in the agreement, granting the municipal right of sovereignty and eminent domain to the United States,

such stipulation would have been void and inoperative, because the *United States have no constituional capacity to exercise municipal jurisdiction, sovereignty or eminent domain within the limits of a State* or elsewhere, except in the cases in which it is expressly granted" (page 223).

After observing that only in the District of Columbia and other places purchased and used for forts, magazines, arsenals, dock-yards and other government buildings, "the national and municipal powers of the government, of every description, are united in the government of the Union," except in cases theretofore mentioned of temporary territorial governments and that even there such a local government existed, he further said:

> "The right of Alabama and *every other new State*, to exercise all the powers of government, which belong to, and may be exercised by the original States of the Union, must be admitted, and remain unquestioned, except so far as they are temporarily deprived of control over the public lands. * * * The right of the United States to these lands * * * originated in voluntary surrenders made by several of the old States, of their waste and unappropriated lands to the United States, under a resolution of the old congress, of the 6th of September, 1780, recommending such surrender and cession, to aid in paying the public debt, incurred by war of the Revolution. The object of all the parties to these contracts of cession was, to convert the land into money, for the payment of the debt, and to erect new States

over the territory thus ceded; and as soon as these purposes could be accomplished, the power of the United States over these lands, as property, was to cease. * * *

We, therefore, think the United States hold the public lands within the new States by force of the deeds of cession, and the statutes connected with them, and not by any municipal sovereignty which it may be supposed to possess, or have reserved by compact with the new States, for that particular purpose. The provision of the constitution above referred to, shows that no such power can be exercised by the United States within a State. Such a power is not only repugnant to the constitution, but it is inconsistent with the spirit and intention of the deeds of cession." (page 224.)

After discussing the power of Congress to make rules and regulations respecting its own territory, he said:

"And this brings us to the examination of the question, whether Alabama is entitled to the shores of the navigable waters, and the soils under them, within her limits. The principal argument relied on against this right, is, that the United States acquired the land in controversy from the king of Spain.

* * * * * * *

If it were true that the United States acquired the whole of Alabama from Spain, no such consequences would result as those contended for. It cannot be admitted that the king of Spain could, by treaty or otherwise, impart to the United States any of his royal prerogatives; and much less can it be

admitted that they have capacity to receive or power to exercise them. Every nation acquiring territory, by treaty or otherwise, must hold it subject to the constitution and laws of its own government, and not according to those of the government ceding it. Vat. Law of Nations, B. 1, c. 19 Secs. 210, 244, 245, and b. 2, c. 7, Sec. 80." (p. 225.)

After a discussion of the Spanish cession, the ordinance of 1787 and the treaty with France, all of which gave to the United States the whole of the territory, he said:

"Alabama is, therefore, entitled to the sovereignty and jurisdiction over all the territory within her limits. * * * To maintain any other doctrine, is to deny that Alabama has been admitted into the Union on an equal footing with the original States, the constitution, laws, and compact, to the contrary notwithstanding. But her rights of sovereignty and jurisdiction are not governed by the common law of England as it prevailed in the colonies before the Revolution, but as modified by our own institutions. In the case of Martin and others v. Waddell, 16 Pet. 410, the present chief justice, in delivering the opinion of the court, said:

'When the Revolution took place, the people of each State became themselves sovereign; and in that character hold the absolute right to all their navigable waters, and the soils under them, for their own common use, subject only to the rights since surrendered by the constitution.'

Then to Alabama belong the navigable

waters, and soils under them, in controversy in this case, subject to the rights surrendered by the constitution to the United States; and no compact that might be made between her and the United States could diminish or enlarge these rights." (page 229).

Of the provision in the enabling act of Alabama declaring that all navigable waters within the State should forever remain public highways, etc., and its alleged conflict with the federal constitution, he said:

> "By the 8th section of the 1st article of the constitution, power is granted to congress 'to regulate commerce with foreign nations and among the several States.' If, in the exercise of this power, congress can impose the same restrictions upon the original States, in relation to their navigable waters, as are imposed by this article of the compact on the State of Alabama, then this article is a mere regulation of commerce among the several States, according to the constitution, and, therefore, as binding on the other States as Alabama. * * * As the provision of what is called the compact between the United States and the State of Alabama does not, by the above reasoning, exceed the power thereby conceded to congress over the original States on the same subject, no power or right was, by the compact, intended to be reserved by the United States nor to be granted to them by Alabama.
>
> This supposed compact is, therefore, nothing more than a regulation of commerce

to that extent among the several states, and can have no controlling influence in the decision of the case before us.

This right of eminent domain over the shores and the soils under the navigable waters, for all municipal purposes, belongs exclusively to the States within their respective territorial jurisdictions, and they, and they only, have the constitutional power to exercise it. * * * But in the hands of the States this power can never be used so as to affect the exercise of any national right of eminent domain or jurisdiction with which the United States have been invested by the constitution."

He then concludes:

"By the preceding course of reasoning we have arrived at these general conclusions: First, the shores of navigable waters, and the soils under them, were not granted by the constitution to the United States, but were reserved to the States respectively. Secondly, the new States have the same rights, sovereignity, and jurisdiction over this subject as the original States. Thirdly, the right of the United States to the public lands, and the power of congress to make all needful rules and regulations for the sale and disposition thereof, conferred no power to grant to the plaintiffs the land in controversy in this case." (p. 230.)

Holyoke Water-Power Co. v. Lyman (1873) involved construction of certain acts of the Massachusetts legislature granting the right to dam the Connecticut River for power and other purposes. It also involved the question of the interference with the

fisheries of the stream. Opinion by Mr. Justice Clifford:

> "Rivers, though not navigable even for boats or rafts, and even smaller streams of water, may be and often are regarded as public rights, subject to legislative control, as the means for creating power for operating mills and machinery, or as the source for furnishing a valuable supply of fish, suitable for food and sustenance. Such water-power is everywhere regarded as a public right, and fisheries of the kind, even in waters not navigable, are also so far public rights that the Legislature of the State may ordain and establish regulation to prevent obstructions to the passage of the fish and to promote the usual and uninterrupted enjoyment of the right by the riparian owners. * * * Water rights of the kind, whether the streams are used for mill purposes or merely as fisheries, are justly entitled to public protection, as they are in many cases of great value to the community where they exist."

> "Public rights, in all juridictions, are subject to legislative control, and it is settled law in Massachusetts, and has been for a century and a half, including her colonial history, that the right of fishery in such rivers as the Connecticut and Merrimac, even above the point where they are navigable for boats or rafts, and the right to erect and maintain dams to create water-power for mill purposes, are public rights and that the owners of such rights are bound

by such reasonable regulations as the State may make and ordain for their protection and enjoyment."

Holyoke Water-Power Co. v. Lyman, 82 U. S. 133, 135, 136, 138; 15 Wall. 500.

Barney v. Keokuk (1877) involved the question of title in certain "made" lands on the water front of Keokuk. Opinion by Mr. Justice Bradley, who after considering the local law of Iowa, as interpreted by its courts, to the effect that the title of riparian proprietors on the Mississippi extends only to the high water mark and that the shore between the high and low water mark as well as the bed of the river, belongs to the State; and after observing that the confusion of navigable with tide waters found in the common law had long prevailed in this country, and had laid the foundation, in many States, of doctrines with regard to the ownership of soil in navigable waters above tide water, he said:

"Whether, as rules of property, it would now be safe to change these doctrines where they have been applied, as before remarked, is for the several States themselves to determine. If they choose to resign to the riparian proprietor rights which properly belong to them in their sovereign capacity, it is not for others to raise objections. In our view of the subject, the correct principles were laid down in *Martin v. Waddell*, 16 Pet. 367, *Pollard v. Hagan* (*supra*), and *Goodtitle v. Kibbe*, 9 How. 471.

It properly belongs to the States by their inherent sovereignty, and the United States has wisely abstained from extending (if it could extend) its survey and grants be-

yond the limits of high water. The cases in which this court has seemed to hold a contrary view depended, as most cases must depend, on the local laws of the States in which the lands were situated."

Barney v. Keokuk, 94 U. S. 324.

McCready v. Virginia (1877) involved the right of Virginia to prohibit the citizens of other States from planting oysters in the Ware River, when its own citizens have that privilege. Opinion by Mr. Chief Justice Waite:

"The principle has long been settled in this court, that each State owns the beds of all tide-waters within its jurisdiction, unless they have been granted away. * * * In like manner, the States own the tide-waters themselves, and the fish in them, so far as they are capable of ownership while running. For this purpose the State represents its People, and the ownership is that of the People in their united sovereignty. *Martin v. Waddell,* 16 Pet. 410.

The title thus held is subject to the paramount right of navigation, the regulation of which, in respect to foreign and interstate commerce, has been granted to the United States. There has been, however, no such grant of power over the fisheries. These remain under the exclusive control of the State, which has consequently the right, in its discretion, to appropriate it tide-waters, and their beds to be used by its People as a common for taking and cultivating fish, so far as it can be done without obstructing navigation.

Such an appropriation is, in effect,

> nothing more than a regulation of the use by the People of their common property. The right which the People of the State thus acquire comes not from their citizenship alone, but from their citizenship and property combined. It is, in fact, a property right, and not a mere privilege or immunity of citizenship."
>
> McCready v. Virginia, 94 U. S. 391.

Pound v. Turck (1878) involved the right of the State of Wisconsin to authorize the construction of dams across the Chippewa river and the interference thereof with navigation. After stating that the want of power was supposed to rest on the repugnance of the Wisconsin statute to the provisions of the federal constitution conferring authority upon Congress "to regulate commerce with foreign nations, and among the several States," Mr. Justice Miller said:

> "The principle established by the decisions to which we have referred is, that, in regard to the powers conferred by the commerce clause of the Constitution, there are some which by their essential nature are exclusive in Congress, and which the States can exercise under no circumstances; while there are others which from their nature may be exercised by the States until Congress shall see proper to cover the same ground by such legislation as that body may deem appropriate to the subject. Of this class are pilotage and other port regulations, *Cooley v. Bd. of Wardens*, 12 How. 299; bridges across navigable streams, *Gilman v. Philadelphia;* and, as specially applicable to the case before us, to erect dams across navigable streams, *Willson v. Black-*

bird Cr. M. Co., 2 Pet. 245. This general doctrine was very fully examined and sustained in *Gilman v. Philadelphia*, 3 Wall. 713, and again in *Crandall v. Nevada*, 6 Wall. 35. * * *

But to the Legislature of the State may be most appropriately confided the authority to authorize these structures where their use will do more good than harm, and to impose such regulations and limitations in their construction and use as will best reconcile and accommodate the interest of all concerned in the matter. And since the doctrine we have deduced from the cases recognizes the right of Congress to interfere and control the matter whenever it may deem it necessary to do so, the exercise of this limited power may all the more safely be confided to the local Legislatures."

Pound v. Turck, 95 U. S. 459, 462, 464.

Escanaba Co. v. Chicago, (1882) involved construction of a bridge across the Chicago River, a navigable stream of Illinois, under the laws of that State. Opinion by Mr. Justice Field:

"But the States have full power to regulate within their limits matters of internal police, including in that general designation whatever will promote the peace, comfort, convenience and prosperity of their people. This power embraces the construction of roads, canals, and bridges, and the establishment of ferries, and it can generally be exercised more wisely by the States than by a distant authority. * * * If the power of the State and that of the Federal government come in conflict, the latter must control

and the former yield. This necessarily follows from the position given by the Constitution to legislation in pursuance of it, as the supreme law of the land. But until Congress acts on the subject, the power of the State over bridges across its navigable streams is plenary. This doctrine has been recognized from the earliest period, and approved in repeated cases, the most notable of which are *Willson v. The Blackbird Creek Marsh Co.*, 2 Pet. 245, decided in 1829 and *Gilman v. Philadelphia*, 3 Wall. 713, decided in 1865."

In denying that the ordinance of July 13, 1787, for the government of the territory northwest of the Ohio River could bind the State of Illinois after its admission, he said:

"Its provisions could not control the authority and powers of the State after her admission. Whatever the limitation upon her powers as a government whilst in a territorial condition, whether from the ordinance of 1787 or the legislation of Congress, it ceased to have any operative force, except as voluntarily adopted by her, after she became a State of the Union. On her admission she at once became entitled to and possessed of all the rights of dominion and sovereignty which belonged to the original States. She was admitted and could be admitted, only on the same footing with them. The language of the resolution admitting her is 'on an equal footing with the original States *in all respects whatever.*' 3 Stat. 536. Equality of constitutional right and

power is the condition of all the States of the Union, old and new. Illinois, therefore, as was well observed by counsel, could afterwards exercise the same power over rivers within her limits that Delaware exercised over Black Bird Creek, and Pennsylvania over the Schuylkill River."

Escanaba Co. v. Chicago, 107 U. S. 678, 683, 687, 688.

Cardwell v. American Bridge Co. (1885), involved an action for the removal of a bridge across the American River, California, as an interference with *navigation*. Opinion by Mr. Justice Field:

"The questions thus presented are neither new nor difficult of solution. Except in one particular, they have been considered and determined in many cases, of which the most important are *Willson v. Blackbird Creek Marsh Co.*, 2 Pet. 245; *Pennsylvania v. Wheeling Bridge Co.*, 13 How. 518, 564; *Gilman v. Philadelphia*, 3 Wall. 713; *Pound v. Turck*, 95 U. S. 459; *Escanaba Co. v. Chicago*, 107 U. S. 678, and *Miller v. Mayor of New York*, 109 U. S. 385. In these cases the control of Congress over navigable waters within the States so as to preserve their free navigation under the commercial clause of the Constitution, the power of the States within which they lie to authorize the construction of bridges over them until Congress intervenes and supersedes their authority, and the right of private parties to interfere with their construction or continuance, have been fully considered, and we

are entirely satisfied with the soundness of the conclusions reached."

Of the contention that a clause in the enabling act admitting California as a State, declaring all navigable waters within the State to be common highways and forever free, etc., a declaration similar to that in the ordinance of 1787, he said:

> "And in *Escanaba Co. v. Chicago,* we held, with respect to the State of Illinois, that the clause was superseded by her admission into the Union, for she then became entitled to and possessed of all the rights of domain and sovereignty which belonged to the original States. The language of the resolution admitting her declared, that it was on 'an equal footing with the original States in all respects whatever;' so that, after her admission, she possessed the same power over rivers within her limits that Delaware exercised over Blackbird Creek and Pennsylvania over Schuylkill River. * * *
>
> The clause, therefore, in the act admitting California, quoted above, upon which the complainant relies, must be considered, according to these decisions, as in no way impairing the power which the State could exercise over the subject if the clause had no existence. * * * The act admitting California declares that she is 'admitted into the Union on an equal footing with the original States *in all respects whatever.*' She was not, therefore, shorn by the clause as to navigable waters within her limits of any of the powers which the original States

possessed over such waters within their limits."

Cardwell v. American Bridge Co., 113 U. S. 205, 208, 210-12.

In *St. Louis v. Myers* (1885), of rights of *riparian owners* it is said:

"They are left to be settled according to the principles of State law."

St. Louis v. Myers, 113 U. S. 566, 567.

Hamilton v. Vicksburg etc. R. R. (1886) involved repair of a bridge over Bouff River, Louisiana, temporarily interfering with navigation. Opinion by Mr. Justice Field:

"What the form and character of the bridges should be, * * * were matters for the regulation of the State, subject only to the paramount authority of Congress to prevent any unnecessary obstruction to the free navigation of the streams. Until Congress intervenes in such cases, and exercises its authority, the power of the State is plenary. When the State provides for the form and character of the structure, its directions will control, except as against the action of Congress, whether the bridge be with or without draws, and irrespective of its effect upon navigation."

In answer to the contention that the clause in the enabling act of Louisiana providing that the river Mississippi, etc., should be common highway and forever free, and that therefore Congress had previously acted in respect to the stream in question, he said:

"A similar provision is found in the acts admitting the States of California, Wisconsin, and Illinois into the Union, with re-

spect to the navigable rivers and waters in them, the purport and meaning of which have been the subject of consideration by this Court. Escanaba Co. v. Chicago, 107 U. S. 678, and Cardwell v. American Bridge Company, 113 U. S. 205. In the latter case, we had before us the clause in the act admitting California, and we held that it did not impair the power which the State could exercise over its rivers, even if the clause had no existence."

Hamilton vs. Vicksburg, etc., R. R. 119 U. S. 280, 281.

Willamette Iron Bridge Co. vs. Hatch (1888) involved construction of an act of the Oregon Legislature permitting the building of a bridge on Willamette River, Oregon. It was charged that the bridge obstructed *navigation* and that it was contrary to the act of Congress admitting the State of Oregon into the Union, wherein it was provided that all navigable waters of the state should be common highways, etc. Opinion by Mr. Justice Bradley:

"The power of Congress to pass laws for the regulation of the navigation of public rivers, and to prevent any and all obstructions therein, is not questioned. But until it does pass some such law, there is no common law of the United States, which prohibits obstructions and nuisances in navigable rivers, unless it be the mairtime law, administered by the courts of admiralty and maritime jurisdiction. * * * Such obstructions and nuisances are offenses against the laws of the states within which the navigable waters lie, and may be in-

dicted or prohibited as such; but they are not offenses against United States laws which do not exist; and none such exist except what are to be found on the statute book. * * * This is the result of so many cases, and expressions of opinion by this court, that it is almost superfluous to cite authorities on the subject. * * *

The usual case, of course, is that in which the acts complained of are clearly supported by a state statute; but that really makes no difference. Whether they are conformable or not conformable to the state law relied on is a state question, not a federal one."

Of the provision in the Oregon enabling act, claimed to vest authority in Congress, he said:

"The clause in question had its origin in the 4th article of the compact contained in the ordinance of the old Congress for the government of the territory northwest of the Ohio, adopted July 13, 1787; * * *

This court has held that when any new state was admitted into the Union from the Northwest Territory, the ordinance in question ceased to have any operative force in limiting its powers of legislation as compared with those posessed by the original states. On the admission of any such new state, it at once became entitled to and possessed all the rights of dominion and sovereignty which belonged to them. See the cases of *Pollard vs. Hagan* (*supra*); *Permoli vs. First Municipality of N. O.*, 44 U. S. 3 How. 589; *Escanaba Co. vs. Chicago;*

Cardwell vs. American Bridge Co.; Huse vs. Glover (*supra*).

In admitting some of the new states, however, the clause in question has been inserted in the law, as it was in the case of Oregon, whether the state was carved out of the territory northwest of the Ohio, or not; and it has been supposed that in this new form of enactment, it might be regarded as a regulation of commerce, which Congress has the right to impose.

* * * * * * *

It is obvious that if the clause in question does prohibit physical obstructions and impediments in navigable waters, the State Legislature itself, in a state where the clause is in force, would not have the power to cause or authorize such obstructions to be made without the consent of Congress. But it is well settled that the legislatures of such states do have the same power to authorize the erection of bridges, dams, etc., in and upon the navigable waters wholly within their limits, as have the original states in reference to which no such clause exists. It was so held in *Pound vs. Turck*, 95 U. S. 459, in reference to a dam in the Chippewa River in Wisconsin, in *Cardwell vs. American Bridge Co.*, 113 U. S. 205, in reference to a bridge without a draw, erected on the American River in California, which prevented steamboats from going above it; and in *Hamilton vs. Vicksburg, S. & P. R. Co.*, 119 U. S. 280, relating to railroad bridges in Louisiana; in all which cases the clause in question was in force in the

states where they arose, and in none of them was said clause held to restrain in any degree the full power of the state to make, or cause to be made, the erections referred to, which must have been more or less obstructions and impediments to the navigation of the streams on which they were placed."

Willamette Iron Bridge Co. vs. Hatch, 125 U. S. 1, 12.

We may here pause to suggest, that even had Congress insisted on the insertion of a clause in the enabling acts of each of the new states, surrendering full jurisdiction to the United States over all streams within the domain of each new state, such a clause would have been inoperative for the reasons assigned in the cases last reviewed.

Control by the states over game is in many respects similar to control over the waters within their domain and we digress for the moment to quote from a more recent decision of this court applying the same reasoning to game as this court applied to waters in the foregoing cases.

Ward vs. Race Horse (1896) involved question of right of Wyoming after admission as a state to control the killing of game within her borders notwithstanding prior treaty with Bannock Indians permitting hunting on government lands. Opinion by Mr. Justice White:

"The power of the state to control and regulate the taking of game cannot be questioned. Geer vs. Conn. 161 U. S. 519."

While discussing the Indian treaty of 1868 and the law of Wyoming passed subsequent to its admission to the Union:

"To suppose that the words of the treaty intended to give to the Indian the right to enter into already established states and seek out every portion of unoccupied government land and there exercise the right of hunting, in violation of the municipal law, would be to presume that the treaty was so drawn as to frustrate the very object it had in view. It would also render necessary the assumption that Congress, whilst preparing the way, by the treaty, for new settlements and new states, yet created a provision not only detrimental to their future well-being, but also irreconcilably in conflict with the powers of the states already existing."

And further:

"The act which admitted Wyoming into the Union, as we have said, expressly declared that that state should have all the powers of the other states of the Union, and made no reservation whatever in favor of the Indians. * * * But the language of the act admitting Wyoming into the Union, which recognized her co-equal rights, was merely declaratory of the general rule."

Of the power of the states to regulate the killing of game within their borders, even on unoccupied government land:

"The power of all states to regulate the killing of game within their borders will not be gainsaid, yet, if the treaty applies to the unoccupied land of the United States in the State of Wyoming, that state would be bereft of such power, since every isolated piece of land belonging to the United States

as a private owner, so long as it continued to be unoccupied land, would be exempt in this regard from the authority of the state. Wyoming, then, will have been admitted into the Union, not as an equal member, but as one shorn of a legislative power vested in all the others states of the Union, a power resulting from the fact of statehood and incident to its plenary existence. * * * The enabling act declares that the State of Wyoming is admitted on equal terms with other states, and this declaration, which is simply an expression of the general rule, which presupposes that states, when admitted into the Union, are endowed with powers and attributes equal in scope to those enjoyed by the states already admitted, repels any presumption that in this particular case Congress intended to admit the State of Wyoming with diminished governmental authority."

Ward vs. Race Horse, 163 U. S. 504, 507, 509, 511, 514.

No reservation of control over waters (other than those already cited concerning navigation) appear in any of the enabling acts admitting the new states to the Union. All specifically declare that the new states are admitted in all respects equal with the original thirteen states so that neither the United States nor any other state may lay claim to any waters within the borders of any new state, but even had such a reservation been attempted it would be inoperative, if for no other reason, as in violation of that provision of the Constitution guaranteeing equality of the new states with the old, in all respects.

Manchester vs. Massachusetts (1891) involved

the right of Massachusetts to control *fisheries* within Buzzard's Bay lying wholly within the territory of that state. Opinion by Mr. Justice Blatchford, wherein he affirms the right of Massachusetts to control the waters of the bay in her sovereign capacity, is in part as follows:

> "By the definitive Treaty of Peace of September 3, 1783, between the United States and Great Britain (8 Stat. 81), His Britannic Majesty acknowledged the United States, of which Massachusetts Bay was one, to be free, sovereign and independent States, and declared that he treated them as such, and, for himself, his heirs and successors, relinquished all claims to the government, propriety and territorial rights of the same and every part thereof. *Therefore, if Massachusetts had continued to be an independent nation, her boundaries on the sea, as defined by her statutes, would unquestionably be acknowledged by all foreign nations, and her right to control the fisheries within those boundaries would be conceded.*" (Italics ours.)

He then speaks of the limits within which by international law Massachusetts is entitled to claim jurisdiction, and continued:

> "We think it must be regarded as established that, as between nations, * * * included in this territorial jurisdiction is the right of control over fisheries, whether the fish be migratory, free-swimming fish, or free-moving fish, or fish attached to or imbeded in the soil."

He then quotes with approval from McCready

vs. Virginia, supra, that the states own all tide waters within their jurisdiction, the fish in them and the soil beneath them and further quotes as follows from Smith vs. Maryland, 59 U. S. 18 How. 71, 74:

> " 'Whatever soil below low-water mark is the subject of exclusive propriety and ownership belongs to the state on whose maritime border and within whose territory it lies, subject to any lawful grants of that soil by the state, or the sovereign power which governed its territory before the declaration of independence. *Pollard vs. Hagan*, 44 U. S. 3 How. 212; *Martin vs. Waddell*, 41 U. S. 16 Pet. 367; *Den vs. Jersey Co.* 56 U. S. 15 How. 462. But this soil is held by the state, not only subject to, but in some sense in trust for, the enjoyment of certain public rights, among which is the common liberty of taking fish, as well shell fish as floating fish.' "

It having been urged that the Massachusetts act was unconstitutional:

> "*In United States vs. Bevans,* Marshall Ch. J., said: 'The jurisdiction of a state is co-extensive with its territory; co-extensive with its legislative power. The place described is unquestionably within the original territory of Massachusetts. It is then within the jurisdiction of Massachusetts, unless that jurisdiction has been ceded to the United States.' If the place where the offense charged in this case was committed is within the general jurisdiction of Massachusetts, then, according to the principles declared in *Smith vs. Maryland*, the statute

in question is not repugnant to the constitution and laws of the United States."

The extent of the territorial jurisdiction of Massachusetts is thus defined:

> "The extent of the territorial jurisdiction of Massachusetts over the sea adjacent to its coast is that of an independent nation; and, except so far as any right of control over this territory has been granted to the United States, this control remains with the state."
>
> Manchester vs. Massachusetts, 139 U. S. 240, 35 U. S. Sup. Ct. Rep. 159, 164, 165, 166.

The leading case of *Hardin vs. Jordan* (1891) involved interpretation of *riparian rights* to lands underlying a small lake in Cook County, Illinois, and whether or not the title of the riparian owner on such lake extended to the center of the lake or the water's edge. Mr. Justice Bradley in an exhaustive opinion reviewed the law as already announced in the foregoing cases and in part said:

> "Such being the form of the title granted by the United States to the plaintiff's ancestor, the question is as to the effect of that title in reference to the lake and the bed of the lake in front of the lands actually described in the grant. This question must be decided by some rule of law, and no rule of law can be resorted to for the purpose except the local law of the State of Illinois. If the boundary of the land granted had been a fresh-water river, there can be no doubt that the effect of the grant would have been

such as is given to such grants by the law of the state, extending either to the margin or center of the stream, according to the rules of that law."

After treating of the effect of meander line surveys and having stated: "It has never been held that the lands under water, in front of such grants, are reserved to the United States or that they can afterwards be granted out to other persons, to the injury of the original grantees," Justice Bradley continued:

> "With regard to grants of the government for lands bordering on tide water, it has been distinctly settled that they only extend to high-water mark, and that the title to the shore and lands under water in front of lands so granted enures to the state within which they are situated, if a state has been organized and established there. Such title to the shore and lands under water is regarded as incidental to the sovereignty of the state—a portion of the royalties belonging thereto and held in trust for the public purposes of navigation and fishery—and cannot be retained or granted out to individuals by the United States. *Pollard vs. Hagan,* 3 How. 212; *Goodtitle vs. Kibbe,* 9 How. 471; *Weber vs. Harbor Commissioners,* 18 Wall. 57. Such title being in the state, the lands are subject to state regulation and control, under the condition, however, of not interfering with the regulations which may be made by Congress with regard to public navigation and commerce. The state may even dispose of the usufruct of such lands,

as is frequently done by leasing oyster beds in them and granting fisheries in particular localities; also, by the reclamation of submerged flats, and the erection of wharves and piers and other adventitious aids of commerce. Sometimes large areas so reclaimed are occupied by cities, and are put to other public or private uses, state control and ownership therein being supreme, subject only to the paramount authority of Congress in making regulations of commerce, and in subjecting the lands to the necessities and uses of commerce. See *Manchester vs. Massachusetts,* 139 U. S. 240; *Smith vs. Maryland,* 18 How. 71; *McCready vs. Virginia,* 94 U. S. 391; *Martin vs. Waddell,* 16 Pet. 367; *Den vs. Jersey Co.,* 15 How. 426.

This right of the states to regulate and control the shores of tide waters, and the land under them, is the same as that which is exercised by the Crown of England. * * * But it depends on the law of each state to what waters and to what extent this prerogative of the state over the lands under water shall be exercised. In the case of *Barney vs. Keokuk,* 94 U. S. 324, we held that it is for the several states themselves to determine this question, and that if they choose to resign to the riparian proprietor rights which properly belong to them, in their sovereign capacity, it is not for others to raise objections."

The Court then reviews the different rules of interpretation of riparian rights obtaining in Iowa

on the one hand and Illinois and Mississipi on the other, and reviews the law of Illinois and authorities from England, Scotland, New York, Massachusetts, New Jersey, Michigan and other states and nations, in their departure or lack of departure from the English common law rules of riparian rights, and the rules adopted by each of the several states in their sovereign jurisdiction of regulation of waters within the borders, as governed and controlled by the local conditions.

The dissenting opinion by Mr. Justice Brewer and Justices Gray and Brown was based entirely upon the interpretation of local laws, but the dissenting justices concurred in the underlying principle that the local law of Illinois must govern, using the following language:

> "Beyond all dispute the settled law of this court, established by repeated decisions, is that the question how far the title of a riparian owner extends is one of local law. For a determination of that question the *statutes of the state and the decisions of its highest court furnished the best and the final authority.* In the case of *St. Louis vs. Rutz*, decided at the present term, 138 U. S. 226, 242, it was said by Mr. Justice Blatchford, speaking for the court: 'The question as to whether the fee of the plaintiff, as a riparian proprietor on the Mississippi River, extends to the middle thread of the stream, or only to the water's edge, is a question in regard to a rule of property, which is governed by the local law of Illinois, *Barney vs. Keokuk*, 94 U. S. 324, 338; *St. Louis vs. Myers*, 113 U. S. 566; *Packer vs. Bird*, 137

U. S. 661. In *Barney vs. Keokuk,* it is said that if the states 'choose to resign to the riparian proprietor rights which properly belong to them in their sovereign capacity, it is not for others to raise objection.' The cases referred to in this quotation affirm the same doctrine."

Mr. Justice Bradley then concludes as follows:

"Believing that the law of Illinois has been determined by its Supreme Court, we think that determination is conclusive on this court. * * * The long judicial experience of those judges and their familiarity with the laws of Illinois give to these opinions great weight."

Hardin vs. Jordan, 140 U. S. 371, 380-2, 384, 402, 405.

Kaukauna Water Power Co. vs. Green Bay & Miss. Canal Co. (1891) involved the use of water *for power* on Fox River, Wisconsin. Opinion by Mr. Justice Brown. After stating that the rights of riparian proprietors have been determined by the courts of Wisconsin, it is said:

"With respect to such rights, we have held that the law of the state, as declared by its Supreme Court, is controlling as a rule of property."

By an act of the legislature of 1848, authorizing the construction of the dam in question, it had been enacted that:

"When a water power shall be created by reason of any dam erected * * * such power shall belong to the state, subject to future action of the legislature."

The validity of the act was questioned. Upon this subject the Court said:

> "The improvement of the navigation of a river is a public purpose, and the sequestration or appropriation of land or other property, therefore, for such purpose is doubtless a proper exercise of the authority of the state under its power of eminent domain.
>
> * * * * * * *
>
> But if, in the erection of a public dam for a recognized public purpose, there is necessarily produced a surplus of water, which may properly be used for manufacturing purposes, there is no sound reason why the state may not retain to itself the power of controlling or disposing of such water as an incident of its right to make such improvements."
>
> Kaukauna Water Power Co. vs. Green Bay & Miss. Canal Co. 142 U. S. 254.

The leading case of *Shively vs. Bowlby* (1894) involved title to lands below the high water mark in Astoria, Oregon. The exhaustive opinion of Mr. Justice Gray reviews the law of England and the United States from the earliest times to the date of the decision, including many of the cases already cited in this brief. Like the case of Kansas vs. Colorado, *infra*, a synopsis of the opinion is inadequate.

In part the Court said, quoting from *Martin vs. Waddell, supra:*

> " 'When the Revolution took place, the people of each state became themselves sov-

ereign; and in that character hold the absolute right to all their navigable waters, and the soils under them, for their own common use, subject only to the rights since surrendered by the Constitution to the general government.' " (p. 16.)

Of the rights of riparian owners in the several colonies:

> "But the nature and degree of such rights and privileges differed in the different colonies, and in some were created by statute, while in others they rested upon usage only." (p. 18.)

Then follows an exhaustive review of the decisions of the courts of the original states. He quotes with approval, in part as follows from *Stevens vs. Patterson & Newark Ry.* 5 Vroom (34 N. J. Law) 532, 549:

> " 'That all navigable waters within the territorial limits of the state, and the soil under such waters, belong in actual propriety to the public, that the riparian owner, by the common law, has no peculiar rights in this public domain as incidents of his estate; and that the privileges he possessed by the local custom or by force of the wharf act to acquire such rights, can, before a possession has been taken, be regulated or revoked at the will of the legislature.' " (p. 22).

From *Bailey vs. Philadelphia, Wilmington & Baltimore R. R.*, 4 Harrison (Del.) 389, 395:

" 'All navigable rivers within the state belong to the state, not merely in right of eminent domain, but in actual propriety.' " (p. 23)

The review of the decisions of the courts of the original thirteen states is then concluded as follows:

"The foregoing summary of the laws of the original thirteen states shows that there is no universal and uniform law upon the subject; but that each state has dealt with the lands under the tide waters within its borders according to its own views of justice and policy, reserving its own control over such lands, or granting rights therein to individuals or corporations, whether owners of the adjoining upland or not, as it is considered for the best interests of the public. Great caution, therefore, is necessary in applying precedents in one state to cases arising in another." (p. 26.)

Of the new states:

"The new states admitted into the Union since the adoption of the Constitution have the same rights as the original states in the tide waters, and in the lands below the high water mark, within their respective jurisdictions." (p. 26.)

He then quotes with approval from *Pollard vs. Hagan, supra:*

" 'Alabama is therefore entitled to the sovereignty and jurisdiction over all the territory within her limits, subject to the common law to the same extent that Georgia possessed it before she ceded it to the United

States. To maintain any other doctrine is to deny that Alabama has been admitted into the Union on an equal footing with the original states, the Constitution, laws and compact to the contrary notwithstanding.' 'Then to Alabama belong the navigable waters, and soils under them in controversy in this case, subject to the rights surrendered by the Constitution to the United States.'" (pp. 27-28.)

The following discussion had been predicated upon the various acts of cession of Virginia and Georgia, but it is then said:

"That these decisions do not, as contended by the learned counsel for the plaintiff in error, rest solely upon the terms of the deed of cession from the State of Georgia to the United States, clearly appears from the constant recognition of the same doctrine as applicable to California, which was acquired from Mexico by the treaty of Guadalupe Hidalgo of 1848." (p. 28.)

Quoting from *Knight vs. U. S. Land Association*, 142 U. S. 183:

"'It is the settled rule of law in this court that absolute property in, and dominion and sovereignty over, the soils under the tide waters in the original states were reserved to the several states; and that the new states since admitted have the same rights, sovereignty and jurisdiction in that behalf, as the original states possess within their respective borders. Upon the acquisi-

tion of the territory from Mexico, the United States acquired the title to tide lands, equally with the title to upland; but with respect to the former they held it only in trust for the future states that might be erected out of such territory.' " (p. 30.)

From *Withers vs. Buckley*, 20 How. 84, he quoted from the opinion of Mr. Justice Daniel, as follows:

" 'It cannot be imputed to Congress that they ever designed to forbid, or to withhold from the state of Mississippi, the power of improving the interior of that state, by means either of roads or canals, or by regulating the rivers within its territorial limits, although a plan of improvement to be adopted might embrace or affect the course or the flow of rivers situated within the interior of the state. Could such an intention be ascribed to Congress, the right to enforce it may be confidently denied. Clearly, Congress could exact of the new state the surrender of no attribute inherent in her character as a sovereign independent state, or indispensable to her equality with her sister states, necessarily implied and guaranteed by the very nature of the Federal compact. Obviously, and it may be said primarily, among the incidents of that equality is the right to make improvements in the rivers, watercourses and highways, situated within the state.' " (p. 34.)

From *St. Clair vs. Lovingston*, 23 Wall 46:

" 'By the American Revolution, the people of each state, in their sovereign char-

acter, acquired the absolute right to all their navigable waters and the soil under them. The shores of navigable waters and the soil under them were not granted by the Constitution to the United States, but were reserved to the states respectively. And new states have the same rights of sovereignty and jurisdiction over this subject as the original ones.' " (p. 36.)

Of the policy of the United States in disposing of public lands:

"And the territories acquired by Congress, whether by deed of cession from the original states, or by treaty with a foreign country, are held with the object, as soon as their population and condition justify it, of being admitted into the Union as states, upon an equal footing with the original states in all respects; and the title and dominion of the tide waters and the lands under them are held by the United States for the benefit of the whole people, and, as this court has often said, in cases above cited, 'in trust for the future states.' * * *

The Congress of the United States, in disposing of the public lands, has constantly acted upon the theory that those lands, whether in the interior or upon the coast, above high water mark, may be taken up by actual occupants, in order to encourage the settlement of the country; but that the *navigable waters*, and the soils under them, whether within or above the ebb and flow of the tide, shall be and remain public highways; and, being chiefly valuable for the pub-

lic purposes of commerce, navigation and fishery, and for the improvements necessary to secure and promote those purposes, shall not be granted away during the period of territorial government; but, unless in case of some international duty or public exigency, shall be held by the United States in trust for the future states, and shall vest in the several states, when organized and admitted into the Union, with all the powers and prerogatives appertaining to the older states in regard to such waters and soils within their respective jurisdictions; in short, shall not be disposed of piecemeal to individuals as private property, but shall be held as a whole for the purpose of being ultimately administered and dealt with for the public benefit by the state, after it shall have become a completely organized community." (pp. 49-50.)

In conclusion:

"At common law, the title and dominion in lands flowed by the tide were in the King for the benefit of the nation. Upon the settlement of the Colonies, like rights passed to the grantees in the royal charters, in trust for the communities to be established. Upon the American Revolution, these rights, charged with a like trust, were vested in the original states within their respective borders, subject to the rights surrendered by the Constitution to the United States.

Upon the acquisition of a territory by the United States, whether by cession from

one of the states, or by treaty with a foreign country, or by discovery and settlement, the same title and dominion passed to the United States for the benefit of the whole people, and in trust for the several states to be ultimately created out of the territory.

The new states admitted into the Union since the adoption of the Constitution have the same rights as the original states in the tide waters, and in the lands under them, within their respective jurisdictions. The title and rights of riparian or littoral proprietors in the soil below high water mark, therefore, are governed by the laws of the several states, subject to the rights granted to the United States by the Constitution.

The United States, while they hold the country as a territory, having all the powers both of national and municipal government, may grant, for appropriate purposes, titles or rights in the soil below high water mark of tide waters. But they have never done so by general laws; and, unless in some case of international duty or public exigency, have acted upon the policy, as most in accordance with the interest of the people and with the object for which the territories were acquired, of leaving the administration and disposition of the sovereign rights in navigable waters, and in the soil under them, to the control of the states, respectively, when organized and admitted into the Union.

Grants by Congress of portions of the public lands within a territory to settlers thereon, though bordering on or bounded by navigable waters, convey, of their own force, no title or right below high water mark, and do not impair the title and dominion of the future state when created; but leave the question of the use of the shores by the owners of uplands to the sovereign control of each state, subject only to the rights vested by the Constitution in the United States." (pp. 57-8.)

Shively vs. Bowlby, 152 U. S. 1.

Grand Rapids & Indiana R. R. Co. vs. Butler (1895) involved title of riparian owners of Grand River, Michigan, a meandered stream, to islands in the channel. Quoting with approval from *Middleton vs. Pritchard,* 3 Scammon 510, 520, and *Hardin vs. Jordan, supra:*

" 'The United States have not repealed the common law as to the interpretation of their own grants, nor explained what interpretation or limitation should be given to or imposed upon the terms of the ordinary conveyances which they use, except in a few special instances; but these are left to the principles of law, and rules adopted by each local government, where the land may lie. We have adopted the common law, and must, therefore, apply its principles to the interpretation of their grant.' "

Further he said:

"*Hardin vs. Jordan* was a case from Illinois, and the question was to the effect of the

title granted by the United States along a small lake, in respect of the bed of the lake in front of the land actually described in the grant, and we said (p. 380): 'The question must be decided by some rule of law, and no rule of law can be resorted to for the purpose except the local law of the State of Illinois. If the boundary of the land granted had been a fresh-water river, there can be no doubt that the effect of the grant would have been such as is given to such grants by the law of the state, extending either to the margin or center of the stream, according to the rules of that law.' "

Grand Rapids & Indiana R. R. Co. vs. Butler, 159 U. S. 87, 93.

Lake Shore & Michigan Southern Ry. Co. vs. Ohio (1897), proceedings by *quo warranto* ordering the removal of a bridge across Ashtabula River, Ohio. The case came before this court on jurisdiction of Ohio or its courts to control the subject matter of the controversy on the theory that a federal and not a state question was presented by reason of act of Congress, Sept. 19, 1890 (26 Stat. 426,453), fixing national regulation of construction of bridges over rivers involving *interstate navigation*. Opinion by Mr. Justice White:

"The contention is that the statute in question manifests the purpose of Congress to deprive the several states of all authority to control and regulate any and every structure over all navigable streams, although they be wholly situated within their territory. That full power resides in the states

as to the erection of bridges and other works in navigable streams wholly within their jurisdiction, in the absence of the exercise by Congress of authority to the contrary, is conclusively determined. *Wilson vs. Blackbird Creek Co.*, 2 Pet. 245; *Withers vs. Buckley*, 20 How. 84; *Cardwell vs. American Bridge Co.*, 113 U. S. 205; *Willamette Bridge Co. vs. Hatch*, 125 U. S. 1; *Shively vs. Bowlby*, 152 U. S. 1, 33, and authorities there cited. Indeed, the argument at bar does not assail the rule settled by the foregoing cases, but asserts that as the power which it recognizes as existing in the states is predicated solely upon the failure of Congress to exert its paramount authority, therefore the rule no longer obtains, since the act of 1890, relied on, substantially amounts to an express assumption by Congress of entire control over all and every navigable stream, whether or not situated wholly within a state."

The Court then discusses the act of 1890 and holds that the purpose of the federal statute was not to deprive the states of all power over navigable streams wholly within their borders but that the federal act simply created an "additional and accumulative remedy to prevent such structures, although lawfully authorized, from interfering with commerce."

Lake Shore & Michigan Southern Ry.
vs. Ohio, 165 U. S. 365, 366, 369.

St. Anthony Falls Water Power Co. vs. St. Paul Water Commissioners (1897) involved damages for alleged injuries to the owners of a certain *power*

plant on the Mississippi River. who claimed right to use of *all the water* that would naturally flow past their land in the Mississippi River, under charter granted by Minnesota, and as riparian land owners. Opinion by Mr. Justice Peckham:

> "In regard to the first proposition, we are of opinion that the property rights of the plaintiff in error, as riparian owners, are to be measured by the rules and decisions of the state courts of Minnesota. This principle, we think has been announced and adhered to by this court from its very early days, and no distinction has been made between the rights of the original states and those which were subsequently admitted to the Union under the provisions of the Federal Constitution. The provisions of the act of Congress, already cited (act of February 26, 1857, C. 60, Sec. 2, 11 Stat. 166), making the Mississippi River a common highway for the inhabitants of the state and all other citizens of the United States, do not impair the title and jurisdiction of the state over the navigable waters within her boundaries more than rights of that nature are limited with regard to the original states. This has been uniformly held, and is so stated in many of the cases hereinafter cited where similar language has been used in the acts admitting states into the Union." (p. 358.)

The cases of *Martin vs. Waddell, supra; Pollard vs. Hagan, supra; Goodtitle vs. Kibbe,* 9 How. 471; *Barney vs. Keokuk, supra; St. Louis vs. Myers,*

supra; Packer vs. Bird, 137 U. S. 661; *Hardin vs. Jordan*, supra; *St. Louis vs. Rutz*, 138 U. S. 226, 242; *Kaukauna Water Power Co. vs. Green Bay & Mississippi Canal Co., supra;* and *Shively vs. Bowlby, supra;* are then reviewed with approval. Of these cases, and particularly the last mentioned, Mr. Justice Peckham then said:

> "The opinion refers to all the cases which we have above recited and many others, upon the various questions which are discussed in the case, and recognizes the rule that it belongs to the states to decide as to the character and extent of the riparian rights of owners upon navigable waters within the states.
>
> * * * The dispute has generally been as to the extent and character of the title as between the United States or the state and the riparian owner to lands under water, and as to the right of the riparian owner to build out from the shore piers or wharves so as to reach the navigable portion of the stream; but the principles laid down in all of these cases necessarily include the right of the state courts to decide, as a matter of local law, the point now under discussion, subject to the acknowledged jurisdiction of the United States under the Constitution in regard to commerce and the navigation of the waters of rivers. The jurisdiction of the state over this question of riparian ownership has been always, and from the foundation of the government, recognized and admitted by this court. The extent of the plaintiff's

riparian right of property was therefore the subject of adjudication by the state court, and the rule has been definitely stated by that court in its judgment, which is now under review." (pp. 365-66.)

Of the claim by the Power Company to the uninterrupted flow of *all* the waters of the Mississippi would naturally pass its plant, free from interference by diversion for municipal purposes subsequent in time to construction of the power plant, it is said:

"They were grants of power to the respective companies, under which they were licensed to build their dams out into the river for the purposes of utilizing the power, and of using the water that flowed down the river. These grants were in legal effect subject at all times to the paramount right of the state as trustee for the public to divert a portion of the waters for public uses, and they were also subject to the rights in regard to navigation and commerce existing in the general government under the Constitution of the United States. * * * But there is nothing in the language of the charters showing or implying that it was the intention of the state to grant to these parties the rights now claimed by them. It is difficult to believe that a legislature would ever grant to individuals or companies rights of that nature, even if it be assumed it had the power. It was proper and in accordance with a wise public policy to grant a privilege to these companies to build dams, etc., as

stated in the charters, and to permit them, by virtue of the dams and sluices, to use the water that in fact and from time to time might come down the river, but it cannot be supposed that the legislature meant by any grant of this kind to warrant that for all future time no part of the water that might otherwise naturally flow down the river should ever be used under the authority of the state for any public purpose, without compensating the plaintiffs for that diversion." (pp. 372-3.)

St. Anthony Falls Water Power Co. vs. St. Paul Water Commissioners, 168 U. S. 349, 358, 372.

United States Freehold Land and Emigration Co. vs. Diego Gallegos, et al. (1898), (No. 2545, U. S. Circuit Court, District of Colorado), involved the question of whether the doctrine of *riparian rights or the doctrine of apprporiation prevails* on the Culebra river, *in Colorado*, all of which stream and its tributaries are located upon the Sangre de Cristo Mexican Land Grant. Opinion by Judge Riner of Cheyenne, Wyoming:

"The demurrer presents the question whether the plaintiff can claim the right to use the water of the Culebra River as riparian proprietor, the river having its source and flowing its entire length through the land of the plaintiff. There is no allegation in the bill that the plaintiff has ever applied any of this water to a beneficial use, and no claim is made based upon its right as a prior appropriator. Its claim is made upon the sole ground that the stream has its

source and flows its entire length through the lands of the plaintiff, and that the grant, the treaty and the act of Congress secure to it the rights of a riparian owner.

Without discussing the question at length, I am inclined to the view that the riparian rights of such a riparian proprietor do not differ in any respect from those held by any other riparian proprietor who derives his title immediately, or mediately, from the United States, and *that the power to prescribe the rules which define and regulate the water rights of private riparian proprietors upon unnavigable streams belongs exclusively to the legislature of the state.* (Italics ours.)

Colorado was admitted into the Union upon an equal footing with the original states. Whatever the limitation upon her powers as a government may have been, while in a territorial condition, it ceased to have any operative force, except as voluntarily adopted by her after she became a state of the Union. On her admission she at once became entitled to and possessed of all the rights of dominion and sovereignty which belonged to the original states."

Of limitations of title through Mexican grant:

"The treaty with Mexico, while it secured to private owners the title and ownership of the tracts of land which had been granted them by Mexico, did not attempt to provide that this ownership should be governed by rules of law different from those

which govern and control all private ownership of lands within the territorial jurisdiction of the United States or of any particular state. And the source of the plaintiff's title can, I think, make no difference as to the rights of property which accompany and flow from its ownership.

The constitution of the State of Colorado provides that 'the water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided.' It further provides that 'the right to divert unappropriaetd waters of any natural stream for beneficial uses shall never be denied,' and that priority of appropriation shall give the better as between those using the water for the same purpose. (Art. 16, Sec. 5-6.)

It was early held in Colorado that the common law doctrine as to the riparian rights by which the riparian proprietor is entitled to the flow of water in its natural channel upon and over his lands, whether he makes any beneficial use of it or not, is inapplicable to Colorado (Coffin vs. Left Hand Ditch Company, 6 Colo. 447). This doctrine is sustained in most, if not all, of the states (except California) within what is known as the arid region.

The common law doctrine relating to the rights of a riparian proprietor in the water of a natural stream, and the use

thereof, is unsuited to our requirements and necessities and never did obtain in this region of country. A different principle, viz., that the right to use water for beneficial purposes depends upon a prior appropriation, is much better adapted to the material conditions existing in this and adjoining states. * * * That the state has the power to regulate the use of water within its boundaries I have no doubt. And to the legislature of the state the authority is most properly confided, to authorize the use of water and to impose such regulations and limitations upon its use as will best reconcile and accommodate the interests of all concerned."

United States Freehold Land & Emigration Co. vs. Diego Gallegos, 1 Legal Adviser (Mills Pub. Co., Denver), 412.

(Note: The above opinion is particularly interesting in view of the fact that it was written by a Wyoming judge sitting for a Colorado court and determining the right of Colorado to control the waters of her streams, prior to the decisions of this Court, which we hereafter cite, which affirm the rules so announced by Judge Riner.)

In *United States vs. Rio Grande Dam & Irrigation Co.* (1899), this court reviewed decisions of the Supreme Court of the Territory of New Mexico in an action brought by the United States to restrain the defendant from constructing a dam for irrigation across the Rio Grande River in the territory in obstruction of navigation. The Territorial courts de-

cided adversely to the contention of the United States. Opinion by Mr. Justice Brewer.

After discussing the question of the navigability of the Rio Grande River in New Mexico, of the right to appropriate the greater portion of the flow of the Rio Grande at the dam, said:

> "The unquestioned rule of the common law was that every riparian owner was entitled to the continued natural flow of the stream." (Quoting 3 Kent Com. Sec. 439.)
>
> "While this is undoubted, and the rule obtains in those states in the Union which have simply adopted the common law, it is also true *that as to every stream within its dominion a state may change this common law rule and permit the appropriation of the flowing waters for such purposes as it deems wise.* Whether this power to change the common law rule and permit any specific and separate appropriation of the waters of a stream belongs also to the legislature of a territory, we do not deem it necessary for the purposes of this case to inquire. We concede *arguendo* that it does.
>
> Although this power of changing the common law rule as to streams within its dominion belongs to each state, yet *two limitations* must be recognized:
>
> First, that in the absence of specific atubority from Congress a state cannot by its legislation destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be necessary

for the beneficial uses of the government property. Second, that it is limited by the superior power of the general government to secure the uninterrupted navigability of all navigable streams within the limits of the United States. In other words, the jurisdiction of the general government over interstate commerce and its natural highways vests in that government the right to take all needed measures to preserve the countryeve n against any state action. * * *

Notwithstanding the unquestioned rule of the common law in reference to the right of a lower riparian proprietor to insist upon the continuous ffow of the stream as it was, and although there has been in all the western states an adoption or recognition of the common law, it was early developed in their history that the mining industry in certain states, the reclamation of arid lands in others, compelled a departure from the common law rule, and justified an appropriation of flowing waters both for mining purposes and for the reclamation of arid lands, and there has come to be recognized in those states, by custom and by state legislation, a different rule—a rule which permits, under certain circumstances, the appropriaton of the waters of a flowing stream for other than domestic purposes."

After quoting from the Acts of Congress of July 26, 1866; March 3, 1877 and March 3, 1891 (which we shall hereafter quote at length), wherein the rights of the states to control their waters are recognized and confirmed, he concluded:

"Obviously by these acts, so far as they extended, *Congress recognized and assented to the appropriation of water in contravention of the common law rule as to continuous flow.* * * * This legislation must be interpreted in the light of existing facts—that all through this mining region in the West were streams, not navigable, whose waters could safely be appropriated for mining and agricultural industries, without serious interference with the navigability of the rivers into which those waters flow. *And, in reference to all these cases of purely local interest the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, although in contravention to the common law rule, which permitted the appropriation of those waters for legitimate industries.*" (Italics ours.)

The remainder of the opinion, construing the act of 1890 concerning navigation, and the paramount rights of the United States to control interference with navigation, we shall quote in a later portion of this brief.

United States vs. Rio Grande Dam & Irrigation Co., 174 U. S. 690, 702-6.

Gutierres vs. Albuquerque Land & Irrigation Co. (1903) involved the validity of certain statutes in the territory of New Mexico concerning construction of irrigation works. Two contentions were urged, first, that the territorial act was invalid because it assumed to dispose of property of the United States without its consent; and, second, that the territorial act was inconsistent with the legislation of Congress and therefore void. We shall later have occasion

to quote at greater length from the opinion of Mr. Justice White. In part he said:

> "The argument in support of the first proposition proceeds upon the hypothesis that the waters affected by the statute are public waters, the property, not of the territory or of private individuals, but of the United States; that by the statute private individuals, or corporations, for their mere pecuniary profit, are permitted to acquire the unappropriated portion of such public waters, in violation of the right of the United States to control and dispose of its own property wheresoever situated. Assuming that the appellants are entitled to urge the objection referred to, we think, in view of the legislation of Congress on the subject of the appropriation of water on the public domain, particularly referred to in the opinion of this court in United States vs. Rio Grande Dam & Irrigation Co., 174 U. S. 704-706, the objection is devoid of merit."

After quoting from the various acts of Congress to which we shall refer, he continued:

> "That the purpose of Congress was to recognize as well the legislation of a territory as of a state with respect to the regulation of the use of public waters, is evidenced by the act of March 3, 1891 (26 Stat. at L. 1095, Chap. 561, U. S. Comp. Stat. 1901, p. 1570)."

Gutierres vs. Albuquerque L. & I. Co.
188 U. S. 545, 552, 553.

Clark vs. Nash (1904) reviewed a decision of the Supreme Court of Utah affirming a judgment of condemnation for right of way in favor of an individual land-owner across his neighbor's land for enlargement of an irrigation ditch. Objection was raised on the ground that the proposed use of the enlarged ditch by a private land-owner was not a public use, even though the statute permitted it. Opinion by Mr. Justice Peckham:

> "In some states, probably in most of them, the proposition contended for by the plaintiffs in error would be sound. But whether a statute of a state permitting condemnation by an individual for the purpose of obtaining water for his land or for mining should be held to be a condemnation for a public use, and, therefore, a valid enactment, may depend upon a number of considerations relating to the situation of the state and its possibilities for land cultivation, or the successful prosecution of its mining or other industries. Where the use is asserted to be public, and the right of the individual to condemn land for the purpose of exercising such use is founded upon or is the result of some peculiar condition of the soil or climate, or other peculiarity of the state, where the right of condemnation is asserted under a state statute, we are always, where it can be fairly be done, strongly inclined to hold with the state courts, when they uphold a state statute providing for such condemnation. * * * Those facts must be general, notorious, and acknowledged in the state, and the state courts

may be assumed to be exceptionally familiar with them. They are not the subject of judicial investigation as to their existence, but the local courts know and appreciate them. They understand the situation which led to the demand for the enactment of the statute, and they also appreciate the results upon the growth and prosperity of the state which, in all probability, would flow from a denial of its validity. * * * With all these the local courts must be presumed to be more or less familiar.

This court has stated that what is a public use may frequently and largely depend upon the facts surounding the subject, and we have said that the people of a state, as also its courts, must, in the nature of things, be more familiar with such facts, and with the necessity and occasion for the irrigation of the lands, than can any one who is a stranger to the soil of the state, and that such knowledge and familiarity must have their due weight with the state courts. *Fallbrook Irrig. District vs. Bradley*, 164 U. S. 112, 159."

After concluding that the use of water for irrigation under the state of facts presented was a "public use," the necessity of the adoption of the rule of appropriation for local administration of water rights in the Western states is thus affirmed:

"The rights of a riparian owner in and to the use of the water flowing by his land are not the same in the arid and mountainous states of the West that they are in the states of the East. These rights have been

altered by many of the Western states by their constitutions and laws, because of the totally different circumstances in which their inhabitants are placed, from those that exist in the states of the East, and such alterations have been made for the very purpose of thereby contributing to the growth and prosperity of those states, arising from mining and the cultivation of an otherwise valueless soil, by means of irrigation. This court must recognize the difference of climate and soil, which render necessary these different laws in the states so situated."

Clark vs. Nash, 198 U. S. 361, 367-9, 370.

Manigault vs. Springs, (1905) involved the damming and obstructing of *navigation* on Kinloch Creek, South Carolina, and the impairment of a stipulation between two *riparian owners* at the mouth of the Creek. Opinion by Mr. Justice Brown:

"As an original proposition we have repeatedly held that, in the absence of legislation by Congress, a state has power to improve its lands and promote the general health by authorizing a dam to be built across its interior streams, though they were previously navigable to the sea by vessels engaged in the coastwise trade."

After quoting with approval from *Willson vs. Blackbird Creek Marsh Co.*, *Pound vs. Turck*, *Escanaba Co. vs. Chicago*, *Cardwell vs. Bridge Co.*, *Willamette Iron Bridge Co. Hatch*, and other cases, *supra*, he continued:

"While all of these cases turned upon the power of the state to authorize the erec-

tion of bridges, *the same principle* applies where the legislature deems it necessary to the public welfare to make *other improvements* for the reclamation of swampy and overflowed lands, though certain individual proprietors may thereby be subjected to expense."

Two of the defendants and another joint riparian owners at the mouth of the creek, entered into a contract in 1898 compromising certain differences relative to a former damming of the creek. In 1903 the General Assembly passed an act deciding the necessity of draining the lowlands in that vicinity and authority was given the defendants to erect and maintain a dam across the creek. To the argument that the act of 1903 impaired the contract between the riparian owners of 1898 the court said:

> "It is the settled law of this court that the interdiction of statutes impairing the obligation of contracts does not prevent the state from exercising such powers as are vested in it for the promotion of the common weal, or are necessary for the general good of the public, though contracts previously entered into between individuals may thereby be affected. This power, which in its various ramifications is known as the police power, is an exercise of the sovereign right of the Government to protect the lives, health, morals, comfort and general welfare of the people, and is paramount to any rights under contracts between individuals.
>
> * * * * * * * *
>
> While this power is subject to limitations in certain cases, there is wide discre-

tion on the part of the legislature in determining what is and what is not necessary—a discretion ordinarily will not interfere with.

* * * * * * * *

It only remains to consider in connection with this branch of the case, whether the act of the General Assembly of 1903 was a proper exercise of the police power of the state. Of this we have no doubt. Although it was not an exercise of that power in its ordinarily accepted sense of protecting the health, lives and morals of the community, it is defensible in its broader meaning of providing for the general welfare of the people, by the reclamation of swampy, overflowed and infertile lands, and the erection of dams, levees and dikes for that purpose. We have often held that private interests are subservient to that right, except where property is taken for which compensation must be paid, and must give way to any general scheme for the reclamation or improvement of such lands."

The Court then concluded the discussion of this phase of the case, as follows:

> "We are of the opinion that the state had full power, in the absence of legislation by congress, to authorize the construction of this dam for the avowed purposes of this act."

Manigault vs. Springs, 199 U. S. 473, 478-9, 480-1, 483.

(Note: By the foregoing, riparian rights are

treated as inferior to the paramount sovereign right of the state.)

Whitaker vs. McBride (1905) involved title of *riparian land owners* along the Platte river in Nebraska, a meandered stream, to an island in the stream. Opinion by Mr. Justice Brewer:

> "It is the settled rule that the question of the title of a riparian owner is one of local law. In *Hardin vs. Jordan*, 140 U. S. 371, the matter was discussed at some length, the authorities cited, and the conclusion thus stated by Mr. Justice Bradley, delivering the opinion of the court (p. 384):
>
> 'In our judgment the grants of the Government for lands bounded on streams and other waters, without any reservation or restriction of terms, are to be construed as to their effect according to the law of the state in which the lands lie.'"
>
> Whitaker vs. McBride, 197 U. S. 510, 511-12.

We have omitted references to the following cases which we shall consider in another portion of this brief:

> Missouri vs. Illinois, (1901) 180 U. S. 208;
>
> Missouri vs. Illinois, (1906) 200 U. S. 496;
>
> Kansas vs. Colorado, (1902) 185 U. S. 125; and
>
> In re Withdrawal of Public Lands, (1903) 32 L. D. 254

Bacon vs. Walker, (1907) involved the construction of a state statute prohibiting the grazing of

sheep on the public domain in Idaho. In the opinion by Mr. Justice McKenna the right of the state to frame its laws and shape its policies to suit its conditions was thus confirmed:

> "The laws and policy of a state may be framed and shaped to suit its conditions of climate and soil. Illustrations of this power are afforded by recent decisions of this court. In Clark vs. Nash, 198 U. S. 361, a use of property was declared to be public which, independent of the conditions existing in the state, might otherwise have been considered as private. See also in Strickley vs. Highland Boy Gold Min. Co., 200 U. S. 527. In the first case there was a recognition of the power of the state to deal with and accommodate its laws to the conditions of an arid country and the necessity of irrigation to its development. The second was the recognition of the power of the state to work out from the conditions existing in a mining region the largest welfare of its inhabitants. And again, in Offield vs. New York N. H. & H. R. R. Co., 203 U. S. 372, the principle of those cases was affirmed and applied to conditions entirely dissimilar."
>
> Bacon vs. Walker, 204 U. S. 311-315.

Kansas vs. Colorado, (1907) involved a determination of the respective rights of the United States, the State of Kansas and the State of Colorado, to the use of the waters of the Arkansas river rising in Colorado and and flowing into Kansas. We shall quote at considerable length from the opinion by Mr. Justice Brewer in a subsequent portion of this brief dealing with the rules for interstate

streams and for the present shall make brief reference to that portion relating to state control of waters:

> "*While arid lands are to be found mainly, if not only, in the Western and newer states, yet the powers of the national government within the limits of those states are the same* (*no greater and no less*) *than those within the limits of the original thirteen;* and it would be strange if, in the absence of a definite grant of power, the national government could enter the territory of the states along the Atlantic and legislate in respect to improving, by irrigation or otherwise, the lands within their borders."

After discussing the claims to national control he concludes:

> "But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that each state has full jurisdiction over the lands within its borders, including the beds of streams and other waters." (Citing many of the decisions of this court already quoted in this brief).

Mr. Justice Brewer then quotes with approval from *Barney vs. Keokuk* and *Hardin vs. Jordan supra*, to the effect that the states in their inherent sovereignty have full jurisdiction over the waters within their borders, save that juridiction conferred upon Congress to regulate public navigation, and says:

"It may determine for itself whether the common law in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriations of waters for the puproses of irrigation shall control. Congress cannot enforce either rule upon any state. * * * *

In the argument on the demurrer counsel for plaintiff endeavored to show that Congress had expressly imposed the common law on all this territory prior to its formation into states. * * * But when the states of Kansas and Colorado were admitted into the Union they were admitted with the full powers of local sovereignty which belonged to other states (Pollard vs. Hagan and Shively vs. Bowlby, supra; Hardin vs. Shedd, 190 U. S. 508, 519) and Colorado by its legislation, has recognized the right of appropriating the flowing waters to the purposes of irrigation."

Kansas vs. Colorado, 206 U. S. 46, 92, 93, 94, 95.

Georgia vs. Tennessee Copper Co. (1907) involved injunction to prevent continued damage to the domain of Georgia. It is decisive of the greater right of the sovereign state to protect her domain irrespective of the private property rights of citizens. We shall quote more at length elsewhere. Mr. Justice Holmes in part said:

"This is a suit by a state for an injury to it in its capacity of quasi-sovereign. In that capacity the state has an interest independent of and behind the titles of its citi-

zens, in all the earth and air within its domain. It has the last word as to whether its mountains shall be stripped of their forests and its inhabitants shall breathe pure air.

Some peculiarities necessarily mark a suit of this kind. If the state has a case at all, it is somewhat more certainly entitled to specific relief than a private party might be. It is not lightly to be required to give up quasi-sovereign rights for pay, and apart from the difficulty of valuing such rights in money, if that be its choice it may insist that an infraction of them shall be stopped. The states, by entering the Union, did not sink to the position of private owners, subject to one system of private law. This court has not quite the same freedom to balance the harm that will be done by an injunction against that of which the plaintiff complains, that it would have in deciding between two subjects of a single political power."

Georgia vs. Tennessee Copper Co., 206 U. S. 230, 237-8.

In *Hudson Water Co. vs. McCarter* (1908) this Court reviewed the decisions of the Court of Errors and Appeals of New Jersey. The opinion by Mr. Justice Holmes clearly defines the sovereign rights of the state in the control of waters within its borders and also the line of demarcation between the private rights of riparian owners and the greater rights of the state:

"The courts below assumed or decided and we shall assume that the defendant represents the rights of a riparian proprietor,

and on the other hand, that it represents no special chartered powers, that give it greater rights than those. On these assumptions the Court of Errors and Appeals pointed out that a riparian proprietor has no right to divert waters for more than a reasonable distance from the body of the streaam or for other than the well-known ordinary uses, and that for any purpose anywhere he is narrowly limited in amount. It went on to infer that his only right in the body of the stream is to have the flow continue, and that there is a residuum of public ownership in the state."

After further discussion of the facts:

"But we prefer to put the authority which cannot be denied to the state upon a broader ground than that which was emphasized below, since in our opinion it is independent of the more or less attenuated residuum of title that the state may be said to possess. * * * * * *

It sometimes is difficult to fix boundary stones between the private right of property the police power when, as in the case at bar, we know of few decisions that are very much in point. But it is recognized that the State as *quasi-soverign* and representative of the interests of the public has a standing in court to protect the atmosphere, the *water* and the forests within its territority, irrespective of the assent or dissent of the private owners of the land most immediately concerned. *Kansas vs. Colorado*, 185 U. S. 125, 141, 142; S. C., 206 U. S. 46, 99; *Georgia*

vs. Tennessee Copper Co., 206 U. S. 230, 238. What it may protect by suit in this court from interference in the name of property outside of the state's jurisdiction, one would think that it could protect by statute from interference in the same name within. On the principle of public interest and the police power and not merely as the inheritor of a royal prerogative, the State may make laws for the preservation of game, which seems a stronger case. *Geer vs. Connecticut*, 161 U. S. 519, 534.

The problems of irrigation have no place here. Leaving them on one side, it appears to us that few public interests are more obvious, indisputable and independent of particular theory than the interest of the public of a State to maintain the rivers that are wholly within it substantially undiminished, except by such drafts upon them as the guardian of the public welfare may permit for the purpose of turning them to a more perfect use. This public interest is omnipresent wherever there is a State, and grows more pressing as population grows. It is fundamental, and we are of opinion that the private property of riparian proprietors cannot be supposed to have deeper roots. Whether it be said that such an interest justifies the cutting down by statute without compensation, in the exercise of the police power of what otherwise would be private rights of property, or that apart from statute those rights do not go to the height of what the defendant seeks to do, the result is the same. But we agree with the New

Jersey courts, and think it quite beyond any rational view of riparian rights than an agreement, of no matter what private owners, could sanction the diversion of an important stream outside the boundaries of the state in which it flows. The private right to appropriate is subject not only to the rights of lower owners but to the initial limitation that it may not substantially diminish one of the great foundations of public welfare and health.

We are of opinion, further, that the constitutional power of the state to insist that its natural advantages shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and there are benefits from a great river that might escape a lawyer's view. *But the state is not required to submit even to an aesthetic analysis.* Any analysis may be inadequate. *It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will.''*

Of the defense under the Fourteenth Amendment, respecting the contractual rights between the riparian owners and New York parties, he said:

"The defense under the Fourteenth Amendment is disposed of by what we have said. That under Article 1, Sec. 10, needs but a few words more. One whose rights,

such as they are, are subject to state restriction, cannot remove them from the power of the state by making a contract about them. The contract will carry with it the infirmity of the subject matter. *Knoxville Water Co. v. Knoxville,* 189 U. S. 434, 438; *Manigault v. Springs,* 199 U. S. 473, 480. But the contract, the execution of which is sought to be prevented here, was illegal when it was made."

Hudson Water Co. v. McCarter, 209 U. S. 349, 354-7.

While in the above opinion Mr. Justice Holmes observes, "The problems of irrigation have no place here" it would seem that the decision, involving as it did the rights of riparian proprietors as against a sovereign state would apply with equal effect to the rights of individual appropriators as against the state, as stated by the late Mr. Kinney:

"It is stated by Mr. Justice Holmes in rendering the opinion of the Court that 'the problems of irrigation have no place here,' the principles laid down in the case apply as much to cases where the diversion and use is made for the purpose of irrigation as for culinary and domestic purposes of a great city, as was the fact in the case at bar. * * *

There is no principle of law, as far as we are able to distinguish, why the same principles as laid down in the above case should not equally apply to a case where the diversion and use of the water was made for the purpose of the irrigation of land as well

as to a case where they were for municipal purposes."

Kinney on Irrigation and Water Rights
2nd Ed. Vol. 3, Page 2224.

See also Walbridge vs. Robinson, 22 Idaho 240, (*infra*) where the Court arrives at the same conclusion expressed by Mr. Kinney.

The decisions of the New Jersey Courts, reviewed by this Court in the above case are of value, not only as regards the limitations of private riparian rights, but as well of the paramount right of the state to control for its own benefit the natural resources of its territority irrespective of the wishes or contracts of the particular class of citizens (riparian owners) whom it had permitted to acquire usufructuary rights in its streams. To these we shall next refer.

McCarter v. Hudson County Water Co. (1905), Court of Chancery of New Jersey, involved taking of waters of Passaic River, in New Jersey to New York for the use of citizens of the latter state under a prohibitory statute of New Jersey. Opinion by Vice-Chancellor Bergen.

After stating the facts of the case wherein certain contracts have been made with a New Jersey Company to enlarge its mains and conduct water to New York and wherein it is said "that some of these contracts were prior and others subsequent to the approval of the legislative act, which defendant insists makes unlawful the threatened acts of the defendant" and "that the defendant had incurred large expense in laying mains and doing other necessary work to enable it to take the water through to New York State previous to the adoption of the statute now under consideration," the Vice-Chancellor said:

"The question is thus presented, can the defendant * * * divert from the Passaic river, free from any control or regulation by the state, whatever quantity it may desire of the fresh water running therein and carry it to another state, the consent of parties in interest other than the state being assumed?

As absolution from control or regulation means the right to withdraw, against the protest of the state, every drop of water from the river, a right which can only be sustained upon the ground of ownership, * * * if the contention of the defendant expresses the law, persons and corporations may, by acquiring the private rights in any running stream, obtain such an ownership in the water passing down the stream as to permit its total withdrawl and transportation to a foreign jurisdiction, leaving the citizens of this state entirely destitute of a natural and necessary element of life, so far as the same may be derived from streams supplied from the running surplus or overflow of water from lakes, ponds, springs and other natural sources of potable water.

If the public have any common rights in or to the running waters of our rivers and streams at any point during its flow to the sea, such a right is manifestly held by the state in trust for the public * * * and the fact that it has not heretofore objected is no reason why it may not now protest against a further spoliation of public property. It may lawfully permit its own citizens the

benefit of property held in trust for them, and at the same time limit such permission to those who have a common right therein.

* * * * * * * * * * *

Whether this act be valid or not, under the view I take of this question the state may rest its case upon general principles, and does not need the support of the statute under review. The state has a duty to perform in that it must protect its citizens against the assumption by individuals or corporations of any of its soverign rights, or the conversion to private use of such common property and rights as the state is said to hold in trust for the public use, the loss of which may destroy the health and comfort of its subjects. * * * * *

It is admitted that the Passaic river is the most important of the available sources of water-supply for the people of New Jersey, and that their necessity therefor is constantly increasing. This river in its natural condition carries from its source to the ebb and flow of the tide a necessary element of life, the common property of the public, subject to usufructuary use, * * * and no one has a right to divert the water for commercial purposes without the grant of the state, in the absence of which such abstraction is the conversion of public property without legislative authority. The state may grant this right, but until it does it should be held beyond the reach of private appropriation.

My opinion is that, subject to the lawful transient rights of riparian owners along the banks of running streams the waters of which finally empty into a tidal stream, there is vested in the soverign power the right to insist upon the proper riparian user of the waters therein, in order that the common right to the use of the residue, which is not private property, may be preserved for the benefit of those to whom all common property belongs; nor would the grant of every owner of land along the stream, from its source to tidewater, affect the right of the public (for which the state is but another name), for that only can be granted which the grantor hath, which is the transitory usufructuary use, subject to which running water is *publicis juris*. As the threatened act is an invasion of a common right, in that it will result in the removal from the state of the common property, it has a right to protest against the proposed diversion, and should seek to protect the public estate."

McCarter v. Hudson County Water Co., 70 N. J. Eq. 525, 527-8, 529, 533-4, 534-5.

McCarter vs. Hudson County Water Co. (1906), Court of Errors and Appeals, New Jersey, reviewed the decision of the Chancery Court (70 N. J. Eq. 525). Opinion by Mr. Justice Pitney, now of this Court.

After stating the facts and setting forth the provisions of the act of 1905 prohibiting the transporta-

tion of water from New Jersey to other states Mr. Justice Pitney said:

> "It is important to keep it clearly in mind that if the defendant carries out the project that it has in contemplation a considerable part of the fresh and potable waters of the River Passaic will be diverted out of the river at Little Falls, and conducted thence in a continuous, artificial channel or channels to some point outside of the State of New Jersey, and will there be permitted (subject only to defendant's control) to escape and flow forth, to the benefit of the citizens of the State of New York, and to the incidental profit of the defendant.
>
> The questions are whether such an artificial and extra-territorial outlet can be prevented by the people of the State of New Jersey, with or without an act of the legislature, and if an act be needed for the purpose whether the act of 1905 is a constitutional piece of legislation.
>
> It must, we think, be sufficiently obvious that the government established in this state by and for the people thereof has complete dominion (subject only to constitutional limitations) over all things within the borders of the state, including all lands and waters, and the mode of acquiring and disposing of rights of property therein. The fresh-water lakes, ponds, brooks, and rivers, and the waters flowing therein, constitute an important part of the natural advantages of this territority, upon the faith of

which its population has multiplied in numbers and increased in material and moral welfare. The regulation of the use and disposal of such waters, therefore, if it be within the powers of the state, is among the most important objects of the government."

After clearly defining the right of riparian owners in the usufructuary title to the waters of the state and the paramount right of the state to control its own natural resources, he answers the argument that the people of New York have a natural right to the waters of New Jersey, if such use can be obtained without impairing riparian owners, in part as follows:

"Stripped of all circumlocution, what is asserted is the right of the people of New York to derive an artificial water-supply from the the territority of New Jersey without the consent of the people of this state. This argument, however, is at once overthrown by reference to the established principle that one state cannot expropriate for its public purposes property within the territory of another state. * * * *

To admit that the people of the State of New York have any inherent right to gain a water supply from the lakes or streams of New Jersey by means of an artificial aqueduct constructed for the purpose is to assert that the sovereignty of New York extends to some extent and for some purposes over the soil of New Jersey. To state the proposition is to refute it. Such interstate

rights can be acquired only by interstate compact."

In conclusion:

"In our opinion, therefore, the legislature may prohibit the abstraction from the lakes, ponds and streams of the state of waters to be used for any other purpose than to meet the lawful uses of riparian owners (saving, of course, other rights vested under grants already made), and when the legislature has forbidden its abstraction for a stated purpose not within such uses, abstraction for that purpose becomes unlawful, and may be restrained at the instance of the attorney general. * * *

The act of 1905 looks not only to the present, but to the future. It recognizes that the growth and prosperity of the state depends not alone upon the advantages that it presently affords, but upon the assurance that the like advantages, to the extent of our natural resources, properly conserved, will remain for posterity. This policy of foresight, and the desire to foreclose in advance any claim of a vested right to transport the waters of our lakes and streams beyond the borders of the state, doubtless entered into the motive of the legislature in imposing a present prohibition."

McCarter v. Hudson County Water Co., 70 N. J. Eq. 695, 700, 701, 717, 719.

The New Jersey Act is set forth in full on pages 698-9, 70, N. J. Eq. in the opinion by Mr. Justice Pit-

ney. It is of interest to here note that California adopted the same act, made to conform to California conditions, in 1911.

See Stat. of Cal. 1911, Chap. 104, p. 271.

Also that Colorado adopted an act modeled after the New Jersey Act in 1917.

Colo. Session Laws, 1917, Chapter 151, p. 539 (quoted *infra*).

In *Walbridge v. Robinson,* 22 Idaho 240, the same doctrine is declared to apply in Idaho, and Wyoming follows the same doctrine in accordance with the opinion of its attorney general. See Biennial Report, Atty. Gen'l Wyo., 1915-16, p. 75.

Boquillas Cattle Co. vs. Curtis (1909) affirms the former decisions of this Court to the effect that each state in the exercise of its sovereign rights has exclusive control over the waters within its borders and may regulate the use of the same irrespective of the common law rules. The suit was brought to prevent the defendants from withdrawing water from the San Pedro River in Arizona by means of a dam and ditch upon the plaintiff's land. Plaintiff claimed title under a Spanish land grant to the lands lying on both sides of the river. Defendants "set up no title except that they had been the first to appropriate the water" while the plaintiff "claims as a riparian owner, and argues that as such it has a right that cannot be taken from it by simple appropriation." The decision of the Supreme Court of the Territority of Arizona dismissing the bill was brought to this Court for review. Opinion by Mr. Justice Holmes, who after discussing and following the decision of the local Court in Arizona and the ef-

fect of the patent of the United States affirming the Mexican Land Grant, said:

> "But, perhaps, the main contention of the plaintiff is based on the legislation of the Territory, and especially on the Howell Code of 1864, Chap. 61, Sec. 7, as follows: 'The common law of England, so far as it is not repugnant to, or inconsistent with the Constitution and laws of the United States, or the bill of rights or laws of this territory, is hereby adopted, and shall be the rule of decision in all the Courts of this Territory.' We assume that this section, however it may affect the case at bar, was within the power of the legislature to enact. * * * But we agree with the territorial court that, construed with the rest of the code, it is far from meaning that patentees of a ranch on the San Pedro are to have the same rights as owners of an estate on the Thames. * * * If there were nothing more in the code, it would be going a great way to say that such a broad phrase forbade the courts to hold that the common law was adaptable and established the English rule of riparian rights only for English conditions. * * * It might be argued, with force, that an amendment, inserting the words 'So far only as is consisent with and adapted to the natural and physical condition of the Territory, and the necessities of the people thereof,' merely expressed what was implied before. * * But we are not left to rely upon reasonable implications and argument, for other parts of the original code are express upon the point. Therefore we need not consider

whether, in any event, the statute could be supposed to confer property rights not previously possessed and not subject to legislative change."

Mr. Justice Holmes then quotes from the laws of Arizona wherein "all streams capable of being used for the purpose of irrigation are declared to be public property, and no one shall have the right to appropriate them exclusively, except under such equitable regulations as the legislature shall provide"; that all streams of running water are public; that the owners of arid lands shall have the right to construct ditches, etc., and are given the right to condemn ways therefor; that preference is given to irrigation over other uses with exclusive right to water for agricultural purposes and that precedence is given in time of scarcity to the oldest titles, and concludes:

> "There are many more details, but we have recited enough to show that the interpretation given by the Court below to the general adoption of the common law by the Howell Code, and the qualifications imposed upon it, were correct. They simply follow what has been understood to be the law for many years. *Clough v. Wing*, 2 Arizona, 371.
>
> The right to use water is not confined to riparian proprietors. *Gutierres v. Albuquerque Land & Irrigation Co.*, 188 U. S. 545, 556; *Coffin v. Left Hand Ditch Co.*, 6 Colorado, 443, 449, 450; *Willey v. Decker*, 73 Pac. Rep. 210, 220. Such a limitation would substitute accident for a rule based upon economic considerations, and an effort,

adequate or not, to get the greatest use from all available land."

Boquillas Cattle Co. v. Curtis, 213 U. S. 339, 345-7.

McGilvra vs. Ross (1909) involved *riparian rights* of lands bordering on Lakes Washington and Union in the State of Washington. The principal question was whether rights below high water mark pass to the patentees as appurtenant to the uplands or whether they vested in the state upon its admission to the Union. By Article XVII of the state constitution of Washington the state asserts its ownership to the beds and shores of all navigable waters in the state up to and including the ordinary water line. Opinion by Mr. Justice McKenna.

After discussing the opinion of *Shively v. Bowlby*, supra, and navigability as a limitation of riparian rights, it is said:

> "It is enough to say that the test of navigability of waters insisted on has had no place in American jurisprudence since the decision in the case of The *Propeller Gennesee Chief vs. Fitzhugh*, 12 How. 443, and is therefore no test of riparian ownership. This is the effect of *Shivley vs. Bowlby*, 152 U. S. *supra*. * * * And the term 'navigable waters,' as there used, meant waters which were navigable in fact. The definition was not inadvertent or unnecessary. It was that to which the reasoning conduced and which became the test of the dominion of the national and state governments over shore lands and the rights which they had or could convey. Hence this conclusion by the Court: 'The title and

rights of riparian or littoral proprietors in the soil below high-water mark, therefore, are governed by the laws of the several States, subject to the rights granted to the United States by the Constitution.'

It was observed that the United States while it is held the country as a Territory, having all the powers of national and municipal government, might have granted for appropriate purposes rights and titles below high-water mark. See *United States v. Winans*, 198 U. S. 371; *Prosser v. Northern Pacific R. R.*, 152 U. S. 59.

But, it was said, that they had never done so by general laws, but had considered it 'as most in accordance with the interest of the people and with the object for which the Territories were acquired of leaving the administration and disposition of the soverign rights in navigable waters, and in the soil under them, to the control of the States respectively, when organized and admitted to the Union.' This policy, it was remarked, as 'to navigable waters and the soils under them, whether within or above the ebb and flow of the tide,' has been 'constantly acted upon.' And hence it was further said: 'Grants by Congress of portions of the public lands within a Territory to settlers thereon, though bordering on or bounded by navigable waters, convey, of their own force, no title or right below high-water mark, and do not impair the title and dominion of the future state created, but leave the question of the use of the shores by the owners of uplands to the sovereign control of each state,

subject only to the rights vested by the Constitution in the United States.' The conclusion necessarily follows, as expressed by the Court, that the state may dispose of its lands under navigable waters 'free from any easement of the upland proprietor.'

Joy vs. St. Louis, 201 U. S. 332, is to the same effect. See also *Scranton v. Wheeler*, 179 U. S. 141, 190; *United States v. Mission Rock Co.*, 189 U. S. 391; *Kansas v. Colorado*, 206 U. S. 46-93. In the latter case it was said, as a deduction from many previous cases, including *Shively v. Bowlby*, 'that each state has full jurisdiction over the lands within its borders, including the beds of streams and other waters.' * * 'It properly belongs to the States by their inherent sovereignty, and the United States has wisely abstained from extending (if it could extend) its survey and grants beyond the limits of high water.' "

McGilvra v. Ross, 215 U. S. 70, 78-80.

Snyder v. Colorado Gold Dredging Co. (1910), Circuit Court of Appeals, Eighth District, involved certain placer mining claims along the Swan river in Colorado, waters for the use of which were claimed under the theory of riparian rights.

Opinion by Mr. Justice Van Devanter (then Circuit Judge):

"The common-law doctrine in respect of the rights of riparian proprietors in the waters of natural streams never has obtained in Colorado. From the earliest times in that jurisdiction the local customs, laws, and

decisions of courts have united in rejecting the doctrine and in adopting a different one which regards the waters of all natural streams as subject to appropriation and diversion for beneficial uses and treats priority of appropriation and continued beneficial use as giving the prior and superior right. Yunker v. Nichols, 1 Colo. 551; Coffin v. Left Hand Ditch Co., 6 Colo. 443, 447; Platte Water Co. v. Northern Colo. Irrigation Co., 12 Colo. 525, 531, 21 Pac. 711; Crippen v. White, 28 Colo. 298, 64 Pac. 184. *In so choosing between these inconsistent doctrines, Colorado acted within the limits of her authority, first* as a territory and and then as a state, and her choice was recognized and sanctioned by Congress, so far far as the public lands of the United States were concerned. United States v. Rio Grande Irrigation Co., 174 U. S. 690, 702-706; Gutierres vs. Albuquerque Land & Irrigation Co., 188 U. S. 545, 552-554; Clark v. Nash, 198 U. S. 361, 370; Kansas vs. Colorado, 206 U. S. 46, 94. Boquillas Land & Cattle Co. v. Curtis, 213 U. S. 339."

Of the application of local law in appropriation states:

"It needs only to be added that, by the settled rule of decision in the Supreme Court of the United States, conveyances by the United States of public lands on non-navigable streams and lakes, when it is not provided otherwise, are to be construed and have effect according to the law of the state in which the lands are situate, in so far

as the rights and incidents of riparian proprietorship are concerned. Hardin vs. Jordan, 140 U. S. 370, 384, 402; Hardin vs. Shedd, 190 U. S. 508, 519; Whitaker vs. McBride, 197 U. S. 510; Harrison v. Fite, 78 C. C. A. 447, 449; 148 Fed. 781, 783. Here it is not provided otherwise, either by statute or by the patent, and, as has been seen, the local law does not recognize a conveyance of the land as carrying any right to the unappropriated waters of the stream."

Snyder v. Colorado Gold Dredging Co.
181 Fed. 62, 65, 69.

In *Walbridge v. Robinson* (1912), Supreme Court of Idaho, the exclusive jurisdiction over and sovereign title to the waters of Idaho was determined. A land owner in Montana was denied the right to divert Idaho waters for the irrigation of his lands to the same degree as the State of New Jersey denied the use of its waters to New York in Hudson County Water Co. vs. McCarter (*supra*), although there was no prohibitive statute in Idaho similar to that of New Jersey (also that now adopted in California and Colorado). Opinion by Mr. Justice Ailshie is in part as follows:

"The state engineer, acting under authority of the state, has prosecuted this appeal. He contends that under the constitution and laws of Idaho, *the waters of the state belong to and are owned by the state*, and that the state holds the title to all the public waters in common for the benefit of all its people. In support of this contention, counsel cite Sec. 1, of Art. 15 of the constitution, which provides that 'The use

of all waters now appropriated, or that may hereafter be appropriated for sale, rental or distribution; also of all water originally appropriated for private use, but which after such appropriation has heretofore been, or may hereafter be sold, rented, or distributed, is hereby declared to be a public use, and subject to the regulation and control of the state in the manner prescribed by law' and Sec. 3240 of the Rev. Codes, which provides that, 'All the waters of the state when flowing in their natural channels, including the waters of all natural springs and lakes within the boundaries of the state, are declared to be the property of the state.' It is further contended that this latter declaration of the statute is only a written expression of what the law has always been with reference to the public waters of a state.

Freund, in his work on the Police Power of the state, at Sec. 417, seems to entertain this view, and in discussing similar statutes in other states, says: 'Such declaration is expressive of what is believed to be the law, and does not intend to make new law.'

We think it is clear that the title to the public waters of the State is vested in the State for the use and benefit of all the citizens of the State under such rules and regulations as may be prescribed from time to time by the law-making power of the State. This is not, however, an interest or title in the proprietary sense, but rather in the sovereign capacity as representative of all the

people for the purpose of guaranteeing that the common rights of all shall be equally protected and that no one shall be denied his proper use and benefit of this common necessity. The interest which an individual or the State may have in such things as water and gas and wild animals has received special consideration from courts and text-writers on account of the tendency of these things to escape beyond the power of control or possession or management of any particular person and without the volition of the one who claims to be the owner. They have, nevertheless, been classed together by most of the authorities. * * *

It will be found that the authorities quite uniformly class wild animals, fish, water, gas, light and air as things of the 'negative community,' or the property of no one, and that they are consequently *res communes* and subject to the regulation and control of the state in its sovereign capacity. * * * * * * * *

There is no doubt in our minds but that *the state* in its sovereign capacity *is the owner of the waters* flowing in the streams thereof and may exercise its authority over the same. If the foregoing propositions be correct, the state has the right to prohibit the diversion of the waters of its streams for use outside of and beyond the boundaries of the state. In other words, as said by the supreme court in *Geer vs. Connecticut, supra,* 'The common ownership imports the right to keep the property, if the sovereign so chooses, always within its jurisdiction for every purpose.' "

The court then quotes with approval from Hudson County Water Co. vs. McCarter (*supra*) and of the right of the state to prohibit diversion of its waters for lands in other states in the absence of prohibitory statutes, said:

> "It is conceded in the outset that there is no express legislation to that effect. It is contended by the appellant that, in the absence of a positive statute authorizing such a thing or conferring such a right, the right does not exist, and that no presumption arises that the state by its silence intends to permit the diversion and use of its waters beyond its jurisdiction. * * *
>
> In the light of these authorities and the fundamental reason and principle of justice on which they rest, it would seem necessary for anyone, who claims a right under the laws of a state, which right is to be exercised beyond the jurisdiction thereof, to rest such right upon some specific legislative grant or authority. In the case at bar, a right is urged to enjoy the use of state property or a natural resource of the state beyond the jurisdictional borders of the state and within the confines of another state. A gift or grant of state property or a public franchise, or a right which must emanate from the sovereignty representing the whole people, ought not to arise by mere inference or failure of the sovereignty to speak on the subject. On the other hand, a failure to speak on the subject or to confer the right in specific terms ought to be construed in favor of the state and against those claiming the right. * * * We are

clear that there is no authority for the diversion and appropriation of the waters of this state for application to a beneficial use in another state."

Walbridge vs. Robinson, 22 Idaho 236, 241-4, 245-7.

Marshall Dental Mfg. Co. vs. State of Iowa (1913) involved title to a meandered lake in Iowa. The State of Iowa was granted an injunction restraining the draining of the lake. Opinion by Mr. Justice Holmes:

"The state courts found that Goose Lake was an unnavigable body of water proper to be meandered, and we see no sufficient reason for going behind these successive findings, if we had power to do so. *Cedar Rapids Gas Light Co. vs. Cedar Rapids*, 223 U. S. 655, 668. See *French vs. Fyan*, 93 U. S. 169; *McCormick vs. Hayes*, 159 U. S. 332.

* * * * * * * *

It is enough to say that by virtue of its sovereignty the State of Iowa has an interest in the condition of the lake sufficient to entitle it to maintain this suit against an intruder without title, whether the state owns the bed or not. This principle has been affirmed and acted on by the court so recently that it does not require further argument here. *Georgia vs. Tennessee Copper Co.*, 206 U. S. 230, 237; *Hudson Water Co. vs. McCarter*, 209 U. S. 349, 356. See also *Kansas vs. Colorado*, 206 U. S. 46, 93; *McGilvra vs. Ross*, 215 U. S. 70, 79."

Marshall Dental Co. vs. State of Iowa, 226 U. S. 460, 461-2.

Scott vs. Lattig (1913) involved the question of title to an island in Snake River, a *navigable* stream constituting the boundary between the states of Oregon and Idaho.

Mr. Justice Van Devanter in delivering the opinion of the court said:

> "It was settled long ago by this court, upon a consideration of the relative rights and powers of the Federal and state governments under the Constitution, that lands underlying navigable waters within the several states belong to the respective states in virtue of their sovereignty and may be used and disposed of as they may direct, subject always to the rights of the public in such waters and to the paramount power of Congress to control their navigation so far as may be necessary for the regulation of commerce among the states and with foreign nations, and that each new state, upon its admission to the Union, becomes endowed with the same rights and powers in this regard as the older ones. *County of St. Clair vs. Lovingston*, 23 Wall. 46, 68; *Barney vs. Keokuk*, 94 U. S. 324, 338; *Illinois Central Railroad Co. vs. Illinois*, 146 U. S. 387, 434-437; *Shively vs. Bowlby*, 152 U. S. 1, 48-50, 58; *McGilvra vs. Ross*, 215 U. S. 70."
>
> Scott vs. Lattig, 227 U. S. 229, 242.

The very recent case of *United States vs. Cress*, (1917) involved recovery of compensation for taking of lands and water rights by means of back-water resulting from construction of Government works

upon the Cumberland and Kentucky rivers, Kentucky, in aid of *navigation.*

The long established rule of the authority of the states over the waters within their borders is thus expressed by Mr. Justice Pitney:

> "*The states have authority to establish for themselves such rules of property as they may deem expedient with respect to the streams of water within their borders, both navigable and non-navigable,* and the ownership of the lands forming their beds and banks (Barney vs. Keokuk, 94 U. S. 324, 338; Packer vs. Bird, 137 U. S. 661, 671; Hardin vs. Jordan, 140 U. S. 371, 382; Shively vs. Bowlby, 152 U. S. 1, 40, 58; St. Anthony Falls Water Power Co. v. Water Comrs. 168 U. S. 349, 358); subject however, in the case of navigable streams, to the paramount authority of Congress to control the navigation so far as may be necessary for the regulation of commerce among the states and with foreign nations (Shively vs. Bowlby, 152 U. S. 1, 40; Gibson vs. United States, 166 U. S. 269, 272; Scott vs. Lattig, 227 U. S. 229, 243)."
>
> United States vs. Cress, — U. S. —, 37 Sup. Ct. Rep. 380, 381.

We believe sufficient appears to justify the conclusions set forth in the "General Statement" at the beginning of this portion of the brief, which we now re-affirm.

We shall now consider the Acts of Congress upon this subject and the cases construing the same.

(b) Acts of Congress and Judicial Construction.

In the foregoing review of the decisions of the Courts we find a unanimity of opinion, from the earliest decisions to those of the present year, upon the fundamental doctrine that each state of the United States has full sovereign jurisdiction over the waters within its borders, whether in arms of the sea, where the tide ebbs and flows, upon the great navigable rivers and lakes or upon the non-navigable streams and bodies of water, and further that this jurisdiction applies to all usufractuary titles (riparian or by appropriation) to uses for navigation (save for Congressional control), fisheries, power, domestic supply, irrigation, and other demands of the state and its citizens, according to local conditions and necessities.

We shall now review the various acts of Congress, particularly with regard to use of waters within the arid region and public land states, wherein it will be observed that the same rule of state jurisdiction over waters is recognized and affirmed both by the acts themselves and by the courts in construing the same. Of the many decisions available, we shall select but a few of those dealing particularly with the subject under consideration.

Act of July 26, 1866.

"Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged *by the local customs, laws, and decisions of Courts*, the possessors and owners of such vested rights shall be maintained and protected in the

same; and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledged and confirmed; but whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury shall be liable to the party injured for such injury or damage."

Act of July 9, 1870.

"All patents granted, or pre-emptions or homesteads allowed, shall be subject *to any vested and accrued water rights*, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section."

Act of March 3, 1877.

The act of March 3, 1877, in relation to desert lands, contained in its first section this proviso:

"*Provided, however*, That the right to the use of water by the persons so conducting the same on or to any tract of desert land of six hundred and forty acres shall depend upon *bona fide* prior appropriation; and such right shall not exceed the amount of water actually appropriated and necessarily used for the purpose of irrigation and reclamation; and all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers and other sources of water supply upon the public lands, and not navigable, shall remain

and be held free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights."

Act of March 3, 1891.

The act of March 3, 1891, provided:

"That the right of way through the public lands and reservations of the United States is hereby granted to any canal or ditch company formed for the purpose of irrigation and duly organized under the laws of any *State or Territory* which shall have filed, or may hereafter file, with the Secretary of the Interior a copy of its articles of incorporation, and due proofs of its organization under the same, to the extent of the ground occupied by the water of the reservoir and of the canal and its laterals, and fifty feet on each side of the marginal limits thereof; also the right to take, from the public lands adjacent to the line of the canal or ditch, material, earth and stone necessary for the construction of such canal or ditch: *Provided*, That no such right of way shall be so located as to interfere with the proper occupation by the Government of any such reservation, and all maps of location shall be subject to the approval of the department of the Government having jurisdiction of such reservation, and the privilege herein granted shall not be construed to interfere with the control of water for irrigation and other purposes under authority of the respective States or Territories."

26 Stat. L. 1095; U. S. Comp. St. 1901, p. 1570.

Act of August 18, 1894.

The act of August 18, 1894 (The Carey Act) grants to the public land states the desert lands therein situated or so much thereof, not exceeding 1,000,000 acres, as the *state may cause to be irrigated*, reclaimed and occupied.

28 Stat. L., P. 422.

Special Act of ~~Feb. 28~~ March 2, 1897.

~~February 26~~ March 2, 1897, Congress passed an act regarding the use of a reservoir theretofore reserved:

> "Provided, That nothing in this act shall be construed to deprive the *State of Colorado* of the control of the water in any reservoir which may be constructed on this site by any person, or corporation, or association *under the regulations provided by the state laws in such cases.*"

29 Stat. L. 603

Act of February 26, 1897.

The act of February 26, 1897 providing for the use and occupation or reservoir sites theretofore reserved by the United States, contained the following proviso:

> "*Provided,* That the charges for water coming in whole or in part from reservoir sites used or occupied under the provisions of the Act *shall always be subject to the control and regulation of the resepctive states and territories* in which such reservoirs are in whole or in part situated."

7 Fed. Stat. Ann., 1905, p. 1098.
29 Stat. L. 391.
2 U. S. Comp. Stat. 1901, p. 1556.

Act of ~~July~~ June 17, 1902, (National Reclamation Act).

~~July~~ June 17, 1902, the National Reclamation Act was passed providing for government assistance in construction or irrigation works within and under the laws of the respective public land states and territories from funds derived from the sale of public lands within the same, and in Section 8 of the act it is provided:

> "*That nothing in this act shall be construed as affecting or intending to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution, of water used in irrigation,* or any vested right acquired thereunder, and the *Secretary of the Interior*, in carrying out the provisions of this act, *shall proceed in conformity with such laws,* and nothing herein shall in any way affect any right of any state or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof; *Provided,* That the right to the use of water acquired under the provisions of this act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limitation of the right."
>
> 7 Fed. St. Ann., 1905. p. 1098;
> Supp. U. S. Comp. St. 1905, p. 349;
> 32 St. L. 388.

The act of February 21, 1911, (36 Stat., 925), authorizes the government, through the Secretary of the Interior, to contract and co-operate with irrigation districts, water users' associations, corporations,

entrymen, or water users for the construction or use of such reservoirs, canals, or ditches as may be advantageously used by the government and irrigation districts, water users' associations, corporations, entrymen, or water users for empounding, delivering, and carrying water for irrigation purposes and then contains the following proviso:

> "*Provided,* that nothing contained in this act shall be held or construed as enlarging or attempting to enlarge the right of the United States, *under existing law,* to control the waters of any stream in any state."

These acts have been repeatedly construed by this Court, and particular reference is made to them in the following cases:

Atchison vs. Peterson, 20 Wall. 507.

Basey vs. Gallagher, Id. 620.

Broder vs. Natoma Water Co., 101 U. S. 274.

Jennison vs. Kirk, 98 U. S. 453, 456.

United States vs. Rio Grande Irr. Co., 174 U. S. 690, 705-6.

Gutierres vs. Albuquerque Land & Irr. Co., 188 U. S. 545, 552-5.

Kansas vs. Colorado, 206 U. S. 46, 85, 94.

Boquillas Land & Cattle Co. vs. Curtis, 213 U. S. 339, 344-5.

Twin Falls Canal Co. vs. Foote, 192 Fed. 583.

Stanfield vs. Umatilla River Water Users Ass'n. 192 Fed. 596.

In *Atchison vs. Peterson* (1874) the use of water in the states and territories according to the local laws, customs and the decisions of their courts and the recognition thereof by Congress in the act of 1866 is thus stated by Mr. Justice Field:

> "As respects the use of water for mining purposes, the doctrines of the common law declaratory of the rights of riparian owners were, at an early day, after the discovery of gold, found to be inapplicable or applicable only in a very limited extent to the necessities of miners and inadequate to their protection. By the common law the riparian owner on a stream not navigable, takes the land to the centre of the stream, and such owner has the right to the use of the water flowing over the land as an incident to his estate. And as all such owners on the same stream have an equality of right to the use of the water, as it naturally flows, in quality, and without diminution in quantity, except so far as such diminution may be created by a reasonable use of the water for certain domestic, agricultural, or manufacturing purposes, there could not be, according to the law, any such diversion or use of the water by one owner as would work material detriment to any other owner below him. * * *
>
> This equality of right among all the propriators on the same stream would have been incompatible with any extended diversion of the water by one proprietor, and its conveyance for mining purposes to the points from which it could not be restored to the stream. But the government being

the sole proprietor of all the public lands, whether bordering on streams or otherwise, there was no occasion for the application of the common-law doctrine of riparian proprietorship with respect to the waters of those streams. The government, by its silent acquiescence, assented to the general occupation of the public lands for mining, and, to encourage their free and unlimited use for that purpose, reserved such lands as were mineral from sale and the acquisition of title by settlement. And he who first connects his own labor with property thus situated and open to general exploration, does, in natural justice, acquire a better right to its use and enjoyment than others who have not given such labor. So the miners on the public lands throughout the Pacific States and Territories by their customs, usages, and regulations everywhere recognized the inherent justice of this principle; and the principle itself was at an early period recognized by legislation and enforced by the courts in those States and Territories. * * *

This doctrine of right by prior appropriation, was recognized by the legislation of Congress in 1866."

Atchison vs. Peterson, 20 Wall. 507, 511-13.

In *Basey vs. Gallagher* (1874) the rights of the western states and territories to control waters within their borders, for irrigation as affirmed by the act of 1866, is thus stated by Mr. Justice Field:

"In the late case of *Atchison vs. Peterson,* we had occasion to consider the respective rights of miners to running waters. * * * No distinction is made in those States and Territories by the custom of miners or settlers, or by the courts, in the rights of the first appropriator from the use made of the water, if the use be a beneficial one. * * *

Ever since that decision it has been held generally throughout the Pacific States and Territories that the right to water by prior appropriation for any beneficial purpose is entitled to protection. Water is diverted to propel machinery in flour-mills and saw-mills, and to irrigate land for cultivation, as well as to enable miners to work their mining claims; and in all such cases the right of the first appropriator, exercised within reasonable limits, is respected and enforced. * * * The act of Congress of 1866 recognizes the right to water by prior appropriation for agricultural and manufacturing purposes, as well as for mining. * * *

It is very evident that Congress intended, although the language used is not happy, to recognize as valid the customary law with respect to the use of water which had grown up among the occupants of the public land under the peculiar necessities of their condition; and that *law may be shown by evidence* of the local customs, or *by the legislation of the State or Territory, or the decisions of the courts.*"

Basey vs. Gallagher, 20 Wall. 670, 681-4.

We pause to note that Colorado was admitted to the Union August 1, 1876, and that at that time only the acts of 1866 and 1870 had been enacted by Congress. These acts and the decisions of the courts construing the same, alone affected the lands in Colorado during its territorial period and all subsequent acts must necessarily refer to lands in Colorado as a state of the Union in all respects equal with the original thirteen states and not as a territory.

In *Jennison vs. Kirk* (1878) the effect of the act of 1866 is thus stated by Mr. Justice Field:

> "In other words, the United States by the section said, that whenever rights to the use of water by priority of possession had become vested, and *were recognized by the local customs, laws, and decisions of the courts*, the owners and possessors should be protected in them; and that the right of way for ditches and canals incident to such water-rights, being recognized in the same manner, should be 'acknowledged and confirmed;' but where ditches subsequently constructed injured by their construction the possessions of others on the public domain, the owners of such ditches should be liable for the injuries sustained."
>
> Jennison vs. Kirk, 98 U. S. 453, 460.

In *United States vs. Rio Grande Dam and Irrigation Co.* (1899) the acts of 1866, 1877 and 1891 are construed and the language in Broder vs. Natoma Water Co., 101 U. S. 274, quoted with approval. The case involved a conflict between the control by the United States (act of 1890, etc.) of the Rio Grande river for navigation and the use of the water thereof for irrigation by the Territory of New Mexico, through one of its corporations.

The case was remanded for further proceedings on the question of navigability. The opinion of Mr. Justice Brewer construing the rights of states and territories to control the waters within their borders, subject to the paramount rights of the United States, is in part as follows:

> "The unquestioned rule of the common law was that every riparian owner was entitled to the continued natural flow of the stream."

He then quotes from 3 Kent. Com., Sec. 439, and proceeds:

> "While this is undoubted, and the rule obtains in those states in the Union which have simply adopted the common law, it is also true *that as to every stream within its dominion a state may change this common law rule and permit the appropriation of the flowing waters for such purposes as it deems wise.* Whether this power to change the common law rule and permit any specific and separate appropriation of the waters of a stream belongs to the legislature of a territory, we do not deem it necessary for the purposes of this case to inquire. We concede *arguendo* that it does."

After speaking of the paramount rights of the United States, he continued:

> "Notwithstanding the unquestioned rule of the common law in reference to the right of a lower riparian proprietor to insist upon the continuous flow of the stream as it was, and although there has been in all the Western states an adoption or recognition of

the common law, it was early developed in their history that the mining industry in certain states, the reclamation of arid lands in others, compelled a departure from the common law rule, and justified an appropriation of flowing waters both for mining purposes and for the reclamation of arid lands, and there has come to be recognized in those states, by custom and by state legislation, a different rule—a rule which permits, under certain circumstances, the appropriation of the waters of a flowing stream for other than domestic purposes. So far as those rules have only a local significance, and affect only questions between citizens of the state, nothing is presented which calls for any consideration by the Federal courts."

Quoting the act of 1866 he said:

"The effect of this statute was to recognize, so far as the United States are concerned, the validity of the local customs, laws and decisions of courts in respect to the appropriation of water. In respect to this, in *Broder vs. Water Company*, 101 U. S. 274, 276, it was said:

'It is the established doctrine of this court that rights of miners, who had taken possession of mines and worked and developed them, and the rights of persons who had constructed canals and ditches to be used in mining operations and for the purposes of agricultural irrigation, in the region where such artificial use of the water was an absolute necessity, are rights which the Government had, by its conduct, recog-

nized and encouraged and was bound to protect before the passage of the act of 1866. We are of opinion that the section of the act which we have quoted was rather a voluntary recognition of a pre-existing right of possession, constituting a valid claim to its continued use, than the establishment of a new one.' "

After quoting the Acts of 1877 and 1891 he said:

"Obviously by these acts, so far as they extended, *Congress recognized and assented to the appropriation of water in contravention of the common law rule as to continuous flow.* * * * This legislation must be interpreted in the light of existing facts—that all through this mining region in the West were streams, not navigable, whose waters could safely be appropriated for mining and agricultural industries, without serious interference with the navigability of the rivers into which those waters flow. *And, in reference to all these cases of purely local interest the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, although in contravention to the common law rule, which permitted the appropriation of those waters for legitimate industries.*" (Italics ours.)

Mr. Justice Brewer then observed that the state would have no right to appropriate all the waters of tributary streams to such a degree as to destroy the navigability of the upper stream and referred to the act of September 19, 1890 (26 Stat. 454, Sec. 10), regarding the government control of navigation and held that this later declaration of Congress would

control over prior statutes. After an interpretation of the power of Congress over navigable streams he concluded:

> "The question always is one of fact, whether such appropriation substantially interferes with the navigable capacity within the limits where navigation is a recognized fact. In the course of the argument this suggestion was made, and it seems to us not unworthy of note, as illustrating this thought. The Hudson River runs within the limits of the State of New York. It is a navigable stream and a part of the navigable waters of the United States, so far at least as from Albany southward. One of the streams which flow into it and contributes to the volume of its waters is the Croton River, a non-navigable stream. Its waters are taken by the State of New York for domestic uses in the city of New York. *Unquestionably the State of New York has a right to appropriate its waters, and the United States may not question such appropriation, unless thereby the navigability of the Hudson be disturbed.* On the other hand, if the State of New York should, even at a place above the limits of navigability, by appropriation for any domestic purposes, diminish the volume of waters, which, flowing into the Hudson, make it a navigable stream, to such an extent as to destroy its navigability, undoubtedly the jurisdiction of the National government would arise and its power to restrain such appropriation be unquestioned; and within the purview of this section it would become the right of the Attorney General to institute proceedings to restrain such appropriation."

The case was remanded for inquiry whether the intended acts of the defendants would substantially diminish the navigability of the Rio Grande.

> United States vs. Rio Grande Dam and Irrigation Co., 174 U. S. 690, 702-6, 709.

In *Gutierres vs. Albuquerque Land & Irrigation Co.* (1903) the rights of certain *territorial acts* of New Mexico respecting irrigation were assailed first, upon the ground that the acts assumed to dispose of property (water) of the United States, and second, because the territorial act was inconsistent with legislation of Congress (Acts of 1866, 1877, 1891 and 1902, *supra*). Mr. Justice White thus disposed of the contentions:

> "The argument in support of the first proposition proceeds upon the hypothesis that the waters affected by the statute are public waters, the property, not of the territory or of private individuals, but of the United States; that by the statute private individuals or corporations, for their mere pecuniary profit, are permitted to acquire the unappropriated portion of such public waters, in violation of the right of the United States to control and dispose of its own property wheresoever situated. Assuming that the appellants are entitled to urge the objection referred to, we think, in view of the legislation of Congress on the subject of the appropriation of water on the public domain, particularly referred to in the opinion of this court in *United States vs. Rio Grande Dam & Irrig. Co.*, 174 U. S. 704-706, the objection is devoid of merit. As

stated in the opinion just referred to, by the act of July 26, 1866 (14 Stat. at L. 253, Chap. 262, sec. 9, Rev. Stat. Sec. 2339, U. S. Comp. Stat. 1901, p. 1437), Congress recognized, as respects the public domain, 'so far as the United States are concerned, the validity of the local customs, laws, and decisions of courts in respect to the appropriation of water.' By the act of March 3, 1877, (19 Stat. at L. 377, chap. 107, U. S. Comp. Stat. 1901, p. 1549), the right to appropriate such an amount of water as might be necessarily used for the purpose of irrigation and reclamation of desert land, part of the public domain, was granted, and it was further provided that 'all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers, and other sources of water supply upon the public lands and not navigable, shall remain and be held free for the appropriation and use of the public for irrigation, mining, and manufacturing purposes, subject to existing rights.'

That the purpose of Congress was to recognize as well the legislation of a territory as of a state with respect to the regulation of the use of public waters, is evidenced by the act of March 3, 1891 (26 Stat. at L. 1095, Chap. 561; U. S. Comp. Stat. 1901, p. 1570)."

Section 18 of the act of 1891 is then quoted wherein "the right of way through all public lands and reservations of the United States is hereby granted to any ditch and canal being formed for the purpose of

irrigation and duly organized under the laws *of any state or territory*" and wherein it is provided that "the privilege herein granted shall not be construed to interfere with the control of water for irrigation and other purposes under authority of the respective *states or territories*" and of the National Reclamation Act, he said:

> "It may be observed that the *purport of the previous acts is reflexively illustrated* by the act of June 17, 1902 (32 Stat. at L. 388). That act appropriated the receipts from the sale and disposal of the public lands in certain states and territories to the construction of irrigation works for the reclamation of arid lands; (Quoting Sec. 8 of the National Reclamation Act.)
>
> It would necessarily seem to follow from the legislation referred to that the statute which we have been considering is not inconsistent with the legislation of Congress on the subject of the disposal of waters flowing over the public domain of the United States. Of course, as held in the *Rio Grande Case*, p. 703, even a state as respects streams within its borders, in the absence of specific authority from Congress, 'cannot, by its legislation, destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far, at least as may be necessary for the beneficial uses of the government property; and the power of a state over navigable streams and their tributaries is further limited by the superior power of the general government to secure the uninterrupted

navigability of all navigable streams within the limits of the United States. Necessarily, these limitations are equally applicable in restraint of the legislative branch of a territorial government, controlled, as is such body, by Congress. * * *

We perceive no merit in the contention that the proviso in the desert land act of March 3, 1877, declaring that surplus water on the public domain shall remain and be held free for the appropriation and use of the public for irrigation, mining, and manufacturing purposes, subject to existing rights, is an expression of the will of Congress that all public waters within its control or the control of a legislative body of its creation must be *directly* appropriated by the owners of land upon which a beneficial use of water is to be made, and that in consequence a territorial legislature cannot lawfully empower a corporation, such as the appellee, to become an intermediary for furnishing water to irrigate the lands of third parties. As all owners of land within the service capacity of appellee's canal will possess the right to use the water which may be diverted into such canal, the use is clearly public (*Fallbrook Irrig. Dist. vs. Bradley*, 164 U. S. 163), and appellee is therefore a public agency, whose right to divert water and whose continued existence is dependent upon the application by it within a reasonable time of such diverted water to a beneficial use. Irrigation corporations generally are recognized in the legislation of Congress, and the rights conferred are not limited to

such corporations as are mere combinations of owners of irrigable land."

Gutierres vs. Albuquerque Land & Irrigation Co., 188 U. S. 545, 553, 554, 556.

In Re Withdrawal of Public Lands for Irrigation Purposes (1903), 32 L. D. 254, involved the construction of National Reclamation Act (32 Stat. 388). The Director of the United States Geological Survey recommended that all lands within one half mile on each side of the center line of the Salmon River, State of Washington, *together with the water flowing theron,* be withdrawn from entry on the ground that the same was required for engineering works under the National Reclamation Act. The communication was referred to the Attorney General of the United States for opinion. September 5, 1903, Assistant Attorney General Campbell rendered opinion wherein he found that the United States had no authority or control over the waters of a stream exclusive jurisdiction of which, save for interstate navigation, was vested in the State of Washington. The opinion was adopted and thereafter followed by the U. S. Reclamation Service. (See Second Annual Report U. S. Reclamation Service, 1902-3, page 36.)

The opinion is especially pertinent in view of the fact that Assistant Attorney General Campbell appeared of counsel for the United States in the case of *Kansas vs. Colorado.* He in part said:

"The purpose to be accomplished by the withdrawal, as will be seen from the text of the letter, is to control the use of the water passing through the lands proposed to be withdrawn, so as to prevent its appropriation by others in any

manner that will impair the continuous flow of the water through said lands, in violation of the common law right of riparian proprietors. The practical question thus presented is, whether the United States, by the exercise of executive authority, has the right to control the use of unappropriated waters passing through the public lands in a state, so as to prevent their appropriation by others for any of the beneficial uses recognized and allowed by the statutes of the state.

The United States, as proprietor of the public lands through which a stream of water naturally flows, has the same property and right in the stream that any owner of land has, be it usufructuary or otherwise. The stream of water is part and parcel of the land, and the right to the use of it and to its continuous flow, without alteration or diminution, is, under the common law, a right incident to the ownership of the soil, enjoyed alike by every riparian proprietor. It is not a property in the water, but a simple usufruct as it pases along. 3 Kent's Com. Sec. 439; Unions M. & M. Co. vs. Ferris 2 Sawy. 176; Vansickle vs. Haines 7 Nev. 249; Lux vs. Haggin 69 Cal. 255.

Such is the cardinal rule that controls in every state of the Union which has simply adopted the common law. While this is true, 'it is also true that as to every stream within its dominion a state may change this common law rule and permit the appropriation

of the flowing waters for such purposes as it deems wise.' (United States v. Rio Grande Irrigation Co. 174 U. S. 690-702.) But, 'in the absence of specific authority from Congress, a state cannot by its legislation destroy the right of the United States, as the owner of lands bordering on a stream, to the continued flow of its waters; so far at least as may be necessary for the beneficial uses of the government property.' (Id. 703.)

In all the arid land states the common law rule as to the right of a riparian proprietor to the continued flow of a stream over his land has been changed, and rights to the use of water for manufacturing, mining, agricultural and other beneficial purposes have accrued and vested, under local customs, the laws of the states and the decisions of the Courts. The statutes of a state providing for the diversion and appropriation of the waters of a flowing stream for irrigation or other public uses is a valid exercise of the legislative power of a soverign state. (Fallbrook Irrigation District, v. Bradley, 164 U. S. 112.)

The constitution of the State of Washington declares that 'the use of the waters of this state for irrigation, mining, and manufacturing purposes shall be deemed a public use.' The laws of the state provide that the use of such water may be acquired by appropriation, and as between appropriations the first in time shall be first in right. The right thus acquired is a property right that may be transferred by deed. Although

in that state, as in all the other states of the arid west, the common law was adopted and recognized, their peculiar physical conditions soon 'compelled a departure from the the common law rule, and justified an appropriation of flowing waters for mining purposes and for the reclamation of arid lands, and there has come to be recognized in those states, by custom and by state legislation, a different rule—a rule which prevents, under certain circumstances, the appropriation of the waters of a flowing stream for other than domestic purposes.' United States v. Rio Grande Irrigation Co., *supra,* page 704.

Such legislation would, however, have had no effect upon the rights of the United States as to the public lands and the waters of the streams and lakes thereon, but for the act of July 26, 1866, (14 Stat., 253; Rev. Stat., Sec. 2339), and subsequent acts of the same character."

He then discussed the Acts of July 26, 1866 (14 Stat., 253), July 9, 1870, (16 Stat., 217), March 3, 1877 (19 Stat., 377), March 3, 1891, (26 Stat., 1095) and the local effect thereof as interpreted by this Court and continued:

> "These acts evince a clear and definite purpose to authorize and assent to the appropriation of water upon the public lands in contravention of the common law rule as to continuous flow * * * ."

He then quoted, with approval, the portions of the opinion of this Court in *United States v. Rio Grande Irrigation Co.* and *Gutierres v. Albuquerque*

Land Co., supra, and after quoting Section 8 of the National Reclamation Act, continued:

> "The absolute right to appropriate the waters flowing over the public lands has been so obviously sanctioned by the acts referred to, and so clearly determined by the decisions cited, as to be no longer an open question. The Director of the Geological Survey, however, bases his recommendation for a withdrawal of land and the riparian right incident thereto upon the theory that whatever recognition and assent may have heretofore been given to the appropriation of the waters on the public lands, the United States may at any time resume the control of all unappropriated waters on such lands, and that 'as the Secretary of the Interior has full power to withdraw from entry any unappropriated lands which, in his opinion, may be necessary for public uses, there appears to be no reason why the Secretary may not, at the same time, withdraw both the land and the water from further appropriation, when the same are required for public use.'
>
> Whether the United States, by the legislative branch of the government, may resume its common law right of riparian proprietorship as to the unappropriated waters flowing over and upon the public domain, by the repeal of the several statutes recognizing rights in contravention thereof, is a question that need not be discussed in determining the question submitted. * * * * Those acts are still in full force and effect, and their operation can not be limited or

suspended by executive authority. Section 8 of the reclamation act is an emphatic declaration that such laws are to continue in force. It expressly declares that in carrying out the provisions of the act it shall not 'interfere with the laws of any State or Territority relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder,' but that it 'shall proceed in conformity with such laws.' A withdrawal of waters from appropriation under the State and Territorial laws would be in direct conflict with the provisions of this section.

I have therefore to advise that there is no authority to make such executive withdrawal of public lands in a state as will reserve the waters of a stream flowing over the same from appropriation under the laws of the state, or will in any manner interfere with its laws relating to the control, appropriation, use or distribution of water."

In Re Withdrawal Public Lands for Irrigation Purposes, Act of June 17, 1902. 32 L. D. 254-8.

In *Kansas vs. Colorado* (1906) Mr. Justice Brewer, in answer to the claim of the National Reclamation Service, of control over all the streams of the Western States, in part said:

"As to those lands within the limits of the states, at least of the Western states, the national government is the most considerable owner and has power to dispose of and make all needful rules and regulations respecting its property. We do not mean

that its legislation can override state laws in respect to the general subject of reclamation. *While arid lands are to be found mainly, if not only, in the Western and newer states, yet the powers of the national government within the limits of those states are the same (no greater and no less) than those within the limits of the original thirteen*, and it would be strange if, in the absence of a definite grant of power, the national government could enter the territory of the states along the Atlantic and legislate in respect to improving, by irrigation or otherwise, the lands within their borders. Nor do we understand that hitherto Congress has acted in disregard to this limitation."

He then quoted, with approval, the language of Mr. Justice White in *Gutierres vs. Albuquerque Land & Irrig Co., supra*, page 554, construing Section 8 of the National Reclamation act (heretofore quoted), wherein he said "the purport of the previous acts" (1866, 1877 and 1891) "is reflexively illustrated by the act of June 17, 1902," and concluded:

> "But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that each state has full jurisdiction over the lands within its borders, including the beds of streams and other waters" (citing cases).
>
> Kansas vs. Colorado, 206 U. S. 46, 92.

Twin Falls Canal Co. vs. Foote (1911), U. S. Circuit Court of Idaho, was commenced before a state court of Idaho for adjudication of conflicting rights

of appropriators of water from Snake River, including appropriations made by the U. S. Reclamation Service by means of one of its irrigation systems diverting water from that stream. The representative in charge of the U. S. Reclamation structures filed petition to remove the case to the Circuit Court of the United States, which, having been granted, *ex parte*, the plaintiff moved to remand to the state court.

The representative in charge of the government project contended that the United States Court should take jurisdiction by reason of the fact that the Reclamation Act is a "revenue law of the United States." In the opinion remanding the action to the state court, United States District Judge Dietrich construed the reclamation act and determined that it was not a "revenue law." After a discussion of the authorities upon this question he said:

> "The storage of water for irrigation purposes or the reclamation of arid lands is not, accurately speaking, a governmental function, and is not 'a necessary part of civil government in the same sense in which the protection of life, liberty and property, the defense of the government against insurrection and foreign invasion, and the administration of public justice, are.' The government, being possessed of large tracts of arid land, which without irrigation are practically worthless, in pursuance of a wise policy, as we think, is, under the reclamation act, engaged in reclaiming them, to the end that they may become marketable and utlimately fruitful.

In prosecuting such an enterprise, however, it is not primarily performing a governmental, or, strictly speaking, even a public function, but is promoting its proprietary interests. Such advantage as arises therefrom to the people at large is material and not governmental, and is only such as might indirectly accrue to the public from the reclamation of an equal amount of land through private enterprise. Kansas vs. Colorado, 206 U. S. 46, 92; United States vs. Hanson, 167, Fed. 881, 93 C. C. A.371; United States vs. Burley (C. C.) 172 Fed. 615, Id., 179 Fed. 1, 102 C. C. A. 429.

It will further be borne in mind that the subject-matter of this action is not, directly, at least, the right to collect dues or enforce contracts, but to use the flow of a certain stream of water. *This right of the government,* such as it possesses, *is of the same quality, and is derived from the same sources and rests upon the same basis as that of the plaintiff or any other claimant.* Not in its sovereign, but in its proprietary capacity, as the owner of arid lands, *it acquired such right, by complying with the laws of the state governing the appropriation and use of water for beneficial purposes.* Congress was careful to make clear its intent in this respect." (Italics ours.)

Judge Dietrich then quotes Section 8 of the Reclamation Act wherein it is provided that all oppropriations of water made by the Reclamation Service shall be subject to the laws and regulations of the states or territories where made and continues:

"In acquiring the right, therefore, and using it, the Secretary of the Interior is not authorized to act independently of, but is directed to proceed in conformity with and subject to, *the laws of the state*, and there can be no implication that Congress intended that all controversies touching a right thus acquired and held under the state laws should be withdrawn from the state courts. The plaintiff is not seeking to restrain the defendant from collecting water rents or water dues, or from enforcing any contracts that have been made for the payment of money. The only substantive relief sought is the adjudication of conflicting claims to certain water, a judicial determination of the extent, and the dignity of the rights of the several parties to the flow of the Snake River. The *right* not having been conferred upon the Secretary of the Interior by the reclamation act, but *having been acquired by him through a compliance with the statutes of the state*, in adjudicating the controversy herein involved, the court exercising jurisdiction, whether it be a state or a federal tribunal, will be under the necessity of construing and applying the statutes, not of the national government, but of the state."

In the remainder of the opinion the Court determined that the reclamation act is not a measure for raising revenue in a constitutional sense and remanded the case to the state court.

Twin Falls Canal Co. vs. Foote, 192 Fed. 583, 594.

Stanfield vs. Umatilla River Water Users' Assn. (1911), U. S. Circuit Court, Oregon, involved a motion to remand the action to the state court from which it had been removed upon motion of Director Newell of the U. S. Reclamation Service under claim that the suit was being prosecuted against an officer appointed and acting under a revenue law of the United States, and also against an officer of the United States claiming to act under a law of Congress.

The action was commenced in the state court to enjoin the reclamation project from operating their canal above the city of Stanfield until so constructed as to prevent damage by loss of water therefrom. In remanding the case to the state court, District Judge Bean found against Director Newell, and, on the claim that he was acting under a revenue law of the United States, said:

> "This question has been recently considered and decided by Judge Deitrich in the District of Idaho. Twin Falls Canal Co., Ltd., vs. Foote, 192 Fed. 583. His conclusions are that the reclamation act is not a revenue law within the meaning of section 643, and that suit commenced in the state court against an officer of the reclamation service cannot be removed to a federal court under the provisions of that section. I had examined the question and reached a similar conclusion before being advised of Judge Deitrich's decision. I can, however, add nothing to his able and exhaustive opinion."

Of the claim that Director Newell was an officer acting under a law of the United States he said:

"It is suggested that, regardless of the method of removal, the Court should retain jurisdiction because the suit is against an officer of the United States claiming to act under a law of Congress. But this is not sufficient to give this court jurisdiction, under the judiciary act of 1887, either as an original action or by removal from a state court. Tennessee vs. Union & Planter's Bank, 152 U. S. 454; Chappell vs. Waterworth, 155 U. S. 102; Walker vs. Collins, 167 U. S. 57; People's U. S. Bank vs. Goodwin (C. C.) 160 Fed. 727. Although it would seem to have been enough under previous legislation. Feibelman vs. Packard, 109 U. S. 421; Bachrack vs. Norton, 132 U. S. 337."

Stanfield vs. Umatilla River Water Users' Assn. et al, 192 Fed. 596, 597.

These acts of Congress and decisions of the courts and the land department, clearly declare and affirm the jurisdiction of the states over the waters within their domain in so far as the United States is concerned.

We shall now refer to the laws and decisions of the courts of the litigant states, Colorado and Wyoming, without further reference upon this topic to the numerous decisions of the courts of other states.

(c) Colorado—Laws and Decisions.

The Colorado enabling act and the proclamation of the President admit the state to the Union "on an equal footing with the original states in all respects whatsoever."

18 U. S. Stat. L. 474.

President's Proclamation, Aug. 1, 1876.

Constitutional Provisions.

The Constitution, made in pursuance of the Enabling Act, and subsequently approved by the proclamation of President Grant, provides:

> "The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to use of the people of the state, subject to appropriation as hereinafter provided." (Art. 16, Sec. 5, Colorado Constitution.)

Then follow provisions giving preference to certain uses over others, and providing for rights of way and for state regulation of charges to water consumers, from canal systems.

> Art. 16, Sec. 6, 7 and 8, Colorado Constitution.

It thus appears that on her very admission and as a part of the solemn transaction, Colorado asserted her full sovereign dominion over the waters of her streams and that this assertion was then and there approved by the United States.

We shall hereafter cite statutes and decisions of her legislatures and courts wherein claim to full control of her waters is again and again asserted, finally culminating in a decision of her courts and an act of her legislature forever putting at rest any assumption of recognition of claims from without her boundaries on the principle of concurrence of laws or otherwise.

Colorado early provided for the careful policing of her streams in various divisions and water districts of her territory and provided procedure for adjudication of the rights of appropriation before her

courts upon the decrees of which the diversions of water are administered by her water officials.

Most of these statutes were enacted and the greater portion of the water of the state had been appropriated and adjudicated before Wyoming was admitted to the Union (July 10, 1890). Of these statutes it is said:

> "The statutes are in the nature of police regulations to secure the orderly distribution of water for irrigation purposes, and to this end they provide a system of procedure for determining the priorities of rights as between carriers."
>
> Combs vs. Farmer's H. L. C. & Co., 38 Colo. 420, 428.

Also:

> "This court has repeatedly upheld the irrigation laws of this state as being an exercise of the police power of the state."
>
> Robertson vs. People, 40 Colo. 119, 124.

Judicial Construction of Constitution.

The foregoing provisions of the Constitution of Colorado have been many times construed by her courts, we shall however confine ourselves to limited citation:

> "Our constitution dedicates all unappropriated water in the natural streams of the state 'to the use of the people,' the ownership thereof being vested in the 'public.' "
>
> Wheeler vs. Northern Colo. Irr. Co. 10 Colo. 582, 587.

Chief Justice Hayt said:

> "Under our constitution, the water of every natural stream in this state is deemed to be the property of the public. Private ownership of water in the natural streams is not recognized. The right to divert water therefrom and apply the same to beneficial uses, is, however, expressly guaranteed. By such diversion and use a priority of right to the use of the water may be acquired. This priority has been declared a property right, and as such subject to sale and transfer."
>
> Ft. Morgan L. & C. Co. vs. South Platte D. Co. 18 Colo. 1, 2.

In *Stockman vs. Leddy* (1912), construction of the above provision of the constitution came before the Supreme Court of Colorado on the question of the right of the legislature to make appropriation for protecting and defending the rights of the state and its citizens, in the waters of the natural streams of the state. The opinion by Chief Justice Campbell leaves no doubt of the meaning of the constitutional provisions and the extent of the claims of the state:

> "That the general assembly, which, under our constitution, is the representative of the people in making laws, has the power, and is charged with the duty, to protect the state's interest in the natural streams of this state, cannot be questioned. * * * From the very beginning of settlement in Colorado territory, and in other arid regions of the West, irrigation has been recognized by federal and state legislation, by the decisions of the federal and state courts, and by the people directly interested, as the declared

public policy. These decisions need not be cited. They are abundant. In Section 5 of Article 16 of our state constitution as originally adopted, this public policy is thus tersely expressed: 'The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided.' Other sections of the same article make such provision. This language is both emphatic and clear. It is the voice of the people who ratified the constitution, and declares for all time the public policy of this state which theretofore had been recognized by all the departments of the dual governments. The statutes which were enacted by the early sessions of our General Assembly to carry out the provisions of this section provide an elaborate and systematic scheme for the distribution of the waters of the state to those entitled to their use.

The state has never relinquished its right of ownership and claim to the waters of our natural streams, though it has granted to its citizens, upon prescribed conditions, the right to the use of such waters for beneficial purposes and within its own boundaries. The property right, however, in the natural streams, and the waters flowing therein, has never been renounced or relinquished by the state, and it has at all times asserted not only its right of ownership, but the unrestrained right, within its

own boundaries, to distribute its waters to those who have, under its authority, acquired, by perfected appropriations, the right to their use.

This constitution of ours was ratified and adopted by the legal voters of the state in accordance with the conditions prescribed by the enabling act of Congress, and the President of the United States in his proclamation admitting Colorado into the Union found the fact to be that the fundamental conditions imposed by Congress on the State of Colorado to entitle it to such admission had been complied with. Congress, in passing the enabling act, and the President, in issuing his proclamation, were aware of the existing physical conditions and of the topography and geography of the state. The federal government, by its lawmaking and executive bodies, knew that the natural streams of this state are, in fact, non-navigable within its territorial limits, and practically all of them have their sources within its own boundaries and that no stream of any importance whose source is without those boundaries, flows into or through this state. The entire volume of these streams is therefore made up of rains and snows that fall upon the surface of lands included within the exterior lines of this state and of springs which issue from the earth within the same area. Such being the peculiar conditions, the state was justified in asserting its ownership of all the natural streams within its boundaries. When Colorado was admitted into the Union with such a consti-

tution, the federal government, through its lawmaking and executive departments, thereby recognized and confirmed such right of ownership as belonging to the state in its sovereign capacity. We therefore find it to be not only that our state constitution and pertinent statutes, but the decisions of the courts and duly announced public policy, all are in accord on the proposition to which the federal government has, as we have just shown, given its consent that the waters of the natural streams of this state belong to the people, to the state, in its sovereign capacity, and that its right to their distribution and control within its borders is free from any interference by any other sovereignty. * * * The right of Congress to regulate and control navigable interstate streams and the jurisdiction of the Supreme Court of the United States to determine, in a controversy between two or more sovereign states over the waters of an interstate stream, whether they are reasonably exercising their inherent powers of sovereignty, are not overlooked or questioned by us; but these considerations do not, for the reasons above stated, affect or bear upon the right of ownership and control by Colorado of its own natural streams, and its power and authority to regulate the distribution of their waters, within its own territory, for beneficial purposes. We find nothing in *United States vs. Rio Grande Irrigation Co.*, 174 U. S. 690, 19 Sup. Ct. 770, 43 L. Ed. 1136; *Kansas vs. Colorado*, 206 U. S. 46, 27 Sup. Ct. 655, 51 L. Ed. 956; *Rickey L.*

& C. Co. vs. Miller & Lux, 218 U. S. 258, 31 Sup. Ct. 11, 54 L. Ed. 1032; *Bean vs. Morris,* 221 U. S. 485, 31 Sup Ct. 703, 55 L. Ed. 821, or in any other case that has been brought to our attention, which militates against our conclusion, when these cases are considered, as they should be, in connection with the facts on which they were determined. We therefore conclude that the general assembly, in order to protect the rights of the state in our natural streams and their waters, and the interests which its citizens have acquired thereunder, may make a valid appropriation of money for the purpose of protecting and defending them."

Stockman vs. Leddy, 55 Col. 24, 27-30.

Statutes to Protect Rights of State.

Reference must again be had to the several acts of the Colorado Legislature, looking particularly to the extent of the claims to full jurisdiction of the state over the waters within its borders and protection thereof from interference from without. In that portion of this brief devoted to a discussion of the cases cited by Wyoming in her "Supplemental Brief," wherein Wyoming relies upon precedents for settlement of mere private rights of citizens of different states (and not upon cases dealing with the rights of states), where it is "assumed, in the absence of legislation to the contrary, that the states were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state that could be acquired within," we shall there observe that Colorado has legislated "to the contrary," and that aside from the fundamental weakness of establishing rules for settlement of mere private property

interests without regard to the rights of states, the cases cited by Wyoming do not apply because of the prohibitory action of Colorado (See p. 153-178 Sup. Brief, Wyo). Nevertheless, the position taken by Colorado should be clearly defined in this portion of the discussion and we shall now refer to several of the more recent of the numerous acts of the Colorado legislature so defining her position.

Act of April 10, 1903, provided for defense of case of Kansas vs. Colorado "and for the protection of the natural streams of Colorado for irrigation, wherever threatened," and appropriated $25,000 for such purpose.

S. L. 1903, Chap. 2, p. 23.

The carrying out of the provisions of the above act, and subsequent similar acts, terminated in 1907.

S. L. 1907, Chap. 57, p. 136.

Act of May 2, 1909, directed the Attorney General to institute and defend suits to defend the waters of the state and to determine whether or not the federal government "is encroaching upon or usurping the rights and powers of the state," etc., and appropriated $20,000 therefor.

S. L. 1909, Chap. 83, p. 199.

Act of May 11, 1911, appointed a joint legislative committee with full powers to investigate and

> "Ascertain whether or not the right of this state to control the distribution of the waters thereof within its borders is thereby in any way unlawfully limited or interfered with or infringed upon * * * and to investigate and determine what claims are made by or upon behalf of any state or corporation or individual thereof to the waters

> of any stream or streams originating or flowing in the State of Colorado to the detriment of the interests of this state and the citizens thereof or the appropriators and users of said waters; and to examine into all matters by which the state's right to control the waters thereof may be affected * * * said committee is hereby empowered to authorize prosecution or defense of such action or actions as it may deem proper to determine or to protect the rights of the state."

The sum of $50,000 was appropriated to carry out the provisions of the bill.

S. L. 1911, Ch. 227, p. 671.

Act of Feb. 25, 1913, after reciting the attacks then pending and threatened against the state and its waters appropriated $50,000 to pay the expenses of bringing or defending suits, etc., "for protection of the right to use the water of the natural streams of Colorado."

S. L. 1913, Ch. 100, p. 381.

Act of Feb. 24, 1915, was similar and made the same appropriation as that of 1913.

S. L. 1915, Ch. 21, p. 93.

Act of April 21, 1917, made and appropriation of $50,000 for defraying expenses of all suits "for the protection of the right to use the water of the natural streams of Colorado * * * wherever threatened," etc.

S. L. 1917, Ch. 33, p. 108.

Thus it appears that Colorado has constantly resisted all attempts to challenge or encroach upon her rights to the use, regulation and control of the

waters within her borders, constituting, as they do, her greatest natural resource, and has repeatedly appropriated her moneys, and without stint, for the protection of her sovereign rights.

By the Act of March 30, 1917, Colorado forever put at rest any possible question of the extent of her claims, if indeed any further act was required after her admission to the Union on an equality with the other states in 1876, and after the most positive declaration of state claim to the waters within her borders made in Art. XVI, Sec. 5, of her constitution above quoted. This last act of her legislature was modeled after the New Jersey Act construed in Hudson County Water Co. vs. McCarter, 209 U. S. 349. (See copy New Jersey Act in opinion by Mr. Justice Pitney, 70 N. J. Eq. 698), but adapted to the Colorado procedure. It reads:

An Act

To preserve and maintain the waters of the State of Colorado and to prevent the diversion, carriage and conveyance thereof into other states for use therein, and to authorize the District and Supreme Courts to enforce the provisions hereof.

Be it Enacted by the General Assembly of the State of Colorado:

Section 1. For the purpose of aiding and preserving unto the State of Colorado and all its citizens the use of all the waters of the springs, lakes, ponds, creeks, rivers, streams and water-courses of this state, which waters do not increase with the growth of population and which are neces-

sary for the health and prosperity of all the citizens of the State of Colorado, and for the growth, maintenance and general welfare of the state, it shall be unlawful for any person, corporation of association to divert, carry or transport by ditches, canals, pipes, conduits, natural streams, or water-courses, the waters of any springs, reservoir, lake, pond creek, river, stream or water-course of this state into any other state for use therein.

Section 2. It shall be the duty of the State Engineer, the Division Engineers and the Water Commissioners of this state, to see that the waters of the state are preserved for the use and benefit of the citizens and inhabitants of the state for its growth, prosperity and general welfare, and to prevent the waters thereof from being diverted, carried, conveyed or transported by ditches, canals, pipes, conduits, natural streams or water-courses, into other states for use therein, and upon its being brought to the knowledge of the State Engineer of Colorado that any person, corporation or association is carying or transporting any of such waters into any other state for use therein, or is intending so to do, it shall be his duty to immediately call the matter to the attention of the Attorney General, who shall, in behalf of and in the name of the state, apply to any District Court or to the Supreme Court of the State of Colorado, for such restraining orders or injunctions, both preliminary and final, as may be necessay to enforce the provision of this act and jurisdiction is conferred upon said courts for such purposes.

Section 3. In the opinion of the General Assembly this act is necessary for the immediate preservation of the public peace, health and safety.

Section 4. In the opinion of the General Assembly an emergency exists, therefore this act shall be in force and take effect from and after its passage.

Approved: March 30, 1917."

S. L. 1917, Ch. 151, p. 539.

In an act permitting the sale, by an irrigation district, of its water system, the following appears:

"The sale herein provided for may be made to any person or persons, to a corporation organized under the laws of the State of Colorado, or may be made to the United States, but no sale of water rights shall in any manner impair or be deemed to relinquish any of the sovereign rights of the State of Colorado in the waters of the state or to control and regulate the diversion, use and distribution thereof."

S. L. Colo., 1917, Ch. 86, Sec. 5. p. 324.

In an Act, introduced at the instance of the Reclamation Service to permit state and government co-operation in construction of irrigation projects in Colorado, the following proviso occurs:

"But, however, all water which has been or is acquired by the district by virtue of the laws of Colorado may be distributed and apportioned according to the terms of any contract entered into between the district and the United States, until the obligation due the United States is paid or the

obligation to pay is discharged in any manner; but nothing in this act contained shall be deemed or construed to grant or relinquish unto the United States any of the sovereign rights of the State of Colorado in and to the waters within its borders, or its exclusive authority over and jurisdiction and control of said waters, and the diversion, appropriation and use thereof, nor in any manner change the methods of appropriation thereof."

S. L. 1917, Ch. 83, Sec. 3, p. 296.

We believe sufficient appears to clearly define the claims of Colorado to the waters within her borders, free from any assumption of recognition of claims of private citizens in other states. As we shall next observe, the claims of Wyoming are, in all essentials similar.

(d) Wyoming—Laws and Decisions.

Wyoming was admitted into the Union July 10, 1890, "on an equal footing with the original states in all respects whatever."

Enabling Act Wyoming—26 Stat. 224, c 664.

Constitutional Provisions.

Her constitution, adopted before admission, made full claim to the waters within her borders in essential respects the same as had Colorado in 1876, with the addition therein of provisions for the policing of her streams by officials in manner theretofore adopted by statute in Colorado save for the creation of a Board of Control:

"Section 1. The water of all natural streams, springs, lakes or other collections of still water, within the boundaries of the state, are hereby declared to be the property of the state.

Section 2. There shall be constituted a board of control, to be composed of the state engineer and superintendent of the water divisions; which shall, under such regulations as may be prescribed by law, have the supervision of the waters of the state and of their appropriation, distribution and diversion, and of the various officers connected therewith. Its decisions to be subject to review by the courts of the state.

Section 3. Priority of appropriation for beneficial uses shall give the better right. No appropriation shall be denied except when such denial is demanded by the public interests.

Section 4. The legislature shall by law divide the state into four (4) water divisions, and provide for the appointment of superintendents thereof.

Section 5. There shall be a state engineer who * * * shall be president of the board of control, and shall have general supervision of the waters of the state and of the officers connected with its distribution * * *."

Wyoming Constitution, Art. VIII, Secs. 1 to 5, inclusive.

(Note: It should be observed that by her constitution no appropriation shall be denied except

when such denial is "demanded by the public interests.")

The preference of uses one over the other is not provided in the constitution, as in Colorado, but is fixed by statute.

Statutes.

The statutes of Wyoming provide:

> "A water right is a right to use the *water of the state,* when such use has been acquired by the beneficial application of water under the laws of the state relating thereto, and in conformity with the rules and regulations dependent thereon. Beneficial use shall be the basis, the measure and limit of the right to use water at all times, not exceeding in any case, the statutory limit of volume. Water being always the property of the state, rights to its use shall attach to the land for irrigation, or to such other purpose or object for which acquired in accordance with the beneficial use made and for which the right receives public recognition, under the law and the administration provided thereby. Water rights cannot be detached from the lands, place or purpose for which they are acquired, without loss of priority."
>
> Wyo. Comp. Stat. (1910), Sec. 724, p. 247.

Then follow statutes defining the preference of various uses, by appropriation, one over the other; provisions requiring all persons intending to appropriate water to first obtain a permit so to do and

that no right shall attach before date of permit, and provisions generally for regulation of diversions and uses of water under state control, leaving adjudication of priorities to the Board of Control, rather than to the courts. While fundamentally the system of state control by dividing the state into divisions for purposes of administration is similar to that of Colorado, nevertheless, the manner of defining the extent of the right to use of water, and the various details of administration are radically different.

Judicial Construction of Constitution.

The above provisions of the Wyoming constitution have been construed and upheld by her courts. In *Farm Inv. Co. vs. Carpenter* (1900), Chief Justice Potter said:

> "At the outset, however, it is strenuously insisted that the declaration contained in the constitution that the waters of the natural streams, etc., are the property of the state, is meaningless and of no force or effect. It is argued that the state no more than an individual can acquire property by a mere assertion of ownership; and that the United States as the primary owner of the soil is also primarily possessed of title to the waters of the streams flowing across the public lands. * * *
>
> So far as any proprietary rights of the United States are concerned, the question would seem to be settled in favor of the effectiveness of the declaration, by the act of admission, which embraces the following provision: 'And that the constitution which the people of Wyoming have formed for

themselves, be, and the same is hereby, accepted, ratified, and confirmed.' McCornick vs. Western Union Tel. Co., 79 Fed. 499. In that case the circuit court of appeals for the 8th circuit of the United States, held that under a similar provision in the act of Congress, admitting Utah, all the provisions of the Utah constitution were invested with all authority conferred by any act of Congress.

But is there not a further and deeper reason for upholding the validity and force of the constitutional declaration? Under the doctrine of prior appropriation, it would seem essential that the property in waters affected by that doctrine should reside in the public, rather than constitute an incident to the ownership of the adjacent lands. Such waters are, we think, generally regarded as public in character.

By the civil law, the waters of all natural streams were *publici juris*, and according to Bracton that was the rule anciently in England. * * * At the modern common law public waters are generally confined to those which are navigable, and public rights therein to navigation and fishery, and privileges incident thereto. In the arid region of this country another public use has been recognized by custom and laws and sanctioned by the courts; a public use sufficient to support the exercise of the power of eminent domain. Fallbrook Irr. Dist. vs. Bradley, 164 U. S. 112, 160. This use, and the doctrine supporting it, is founded upon the necessities

growing out of natural conditions, and is absolutely essential to the development of the material resources of the country. Any other rule would offer an effectual obstacle to the settlement and growth of this region, and render the lands incapable of continued successful cultivation. The waters for the reclamation of the desert lands must be obtained, in a very large measure, from the natural streams and other natural bodies of water.

The common law doctrine of riparian rights relating to the use of the water of natural streams and other natural bodies of water not prevailing, but the opposite thereof, and one inconsistent therewith, having been affirmed and asserted by custom, laws, and decisions of courts, and the rule adopted permitting the acquisition of rights by appropriation, the waters affected thereby become perforce *publici juris*. It is therefore doubtful whether an express constitutional or statutory declaration is required in the first place to render them public.* * * We entertain no doubt of the power of the people in their organic law, when existing vested rights are not unconstitutionally interfered with, to declare the waters of all natural streams, and other natural bodies of water, to be the property of the public, or of the state. Nor do we doubt that the legislature may make a like declaration, when, in that particular, unrestrained by the constitution.

If any consent of the general government was primarily requisite to the incep-

tion of the rule of prior appropriation, that consent is to be found in several enactments by Congress, beginning with the Act of July 26, 1866, and including the Desert Land Act of March 3, 1877. Those acts have been too often quoted and are too well understood to require a restatement at this time at the expense of unduly extending this opinion.

It has been held that the Act of July 26, 1866, was rather a voluntary recognition by Congress of pre-existing rights, constituting valid claims to a continued use, than the establishment of new rights. Brodie v. Water Co., 101 U. S. 274.

By these various acts, 'the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, although in contravention to the common law, which permitted the appropriation of these waters for legitimate industries,' and, 'a state may change the common law rule, and permit the appropriation of the flowing waters for such purposes as it deems best.' U. S. V. Rio Grande Irr. Co., 174 U. S. 690.

If, as has been said, the title of the general government to the public lands is that of proprietor rather than sovereign (Kinney on Irr., Sec. 145), it would seem that its rights as such are not greater to the waters of the streams flowing across the lands than those of an individual owner.

In Arizona and Nevada, the statutes declare the ownership of the public in the waters of the natural streams. * * *

> The effect of such a declaration has been determined by the Courts of Colorado, whose constitution declares that the unappropriated waters of the streams within the state are the property of the public."

He then cites with approval the quotations in the first two cases, *supra*, wherein the Supreme Court of Colorado construed the constitution of that state and continued:

> "There is to be observed no appreciable distinction, under the doctrine of prior appropriation, between a declaration that the water is the property of the public, and that it is the property of the state.
>
> It is said in McCready v. Virginia, 94 U. S. 391, in discussing the subject of tide waters: 'In like manner the states own the tide waters themselves. * * * For this purpose, the state represents its people, and the ownership is that of the people in their united sovereignty. See also Martin v. Waddell, 16 Pet. 410; Gould on Waters, Sec. 32; Bell vs. Gough, 23 N. J. L. 624. The sovereign is trustee for the public.' 3 Kent's Com. 427; Miller v. Mendenhall (Minn.), 8 L. R. A. 89.
>
> The ownership of the state is for the benefit of the public or the people. By either phrase, 'property of the public' or 'property of the state,' the state, as representative of the public or the people, is vested with jurisdiction and control in its sovereign capacity.
>
> * * * There can hardly be any controversy over the power of the state to regulate

prior, as well as subsequent, rights of appropriation. * * *

From any standpoint we think it is clear that the declaration that the waters subject to appropriation for beneficial purposes are the property of the state, is valid and effectual.

The other fundamental principles expressed in the constitution, are, that control of the public waters must be in the state, which in providing for their use shall equally guard all the various interests involved. Such control shall consist in a supervision of the waters, their *appropriation, distribution, and diversion,* by a Board of Control to be composed of certain designated officers, with an officer of technical and practical knowledge and experience at its head; and priority of appropriation shall give the better right."

In closing the opinion he upholds the system of adjudication of priorities by the Board of Control in Wyoming.

Farm Inv. Co. v. Carpenter, 9 Wyo. 110, 135-8, 138-41.

While in *Willey v. Decker,* 11 Wyo. 496, which we shall hereinafter consider, the Court held that as to certain water rights which vested on Young's Creek while Montana and Wyoming were both territories and before either had passed into soverign control of the streams within their respective borders, the Wyoming court might adjudicate rights for the irrigation of lands in Montana, that opinion was specifically limited to a construction of the particular rights there involved and Chief Justice Potter

took pains to there state that the opinion should not be authority as to rights vesting after the admission of either of the states, and by a later decision in *Grover Irr. Co. vs. Lovella Ditch Co.*, (1913) likewise by Chief Justice Potter, it will appear that Wyoming assumes the same attitude of exclusive control over the waters within her borders which has been taken by Colorado, California and other states.

While the latter case involved the question of the right of a Colorado corporation to condemn lands in Wyoming for the upper portion of its ditch diverting waters in Wyoming from Crow Creek, an interstate stream (rising in Wyoming and flowing into Colorado), and carrying the same across the line for use upon lands in Colorado immediately adjacent to the interstate line, the effect nevertheless of the decision which denied to the Colorado corporation the right to condemn lands for its ditch in Wyoming, was equivalent to forbidding the diversion of water in Wyoming for use on lands in another state, notwithstanding the fact that the *res* and parties were both in Wyoming and submitted to the jurisdiction of its courts.

In a very elaborate opinion Chief Justice Potter reviews the law relative to the exercise of eminent domain in one sovereignty for the benefit of property in another and said in part:

> "Eminent domain is generally defined as the right or power of a sovereign state to appropriate private property to particular uses, for the purpose of promoting the general welfare. * * * In this respect the several states are distinct and independent of each other, respectively possessing and exercising the power for their own purposes or their own public welfare. 'The

eminent domain in any sovereignty exists only for its own purposes.' * * *

"The principle above discussed, that the power of eminent domain will be exercised by a state for its own purposes, and not for the use of another state, seems, therefore, to be applicable. Clearly the State of Colorado cannot exercise the power in this state, and any authority conferred by its laws to do so would be void, for it is fundamental that the sovereignty of any government is limited to persons and property within the territority it controls. * * * *

While this state may be interested and even indirectly benefited in the manner above indicated by the reclamation and settlement of lands in another state, it would be difficult, we think, to uphold the exercise of eminent domain in this state on the ground that such reclamation and settlement in another state is a necessity of the government of this state, in view of the fact that within its own boundaries and in all parts of the state there are vast areas yet uncultivated capable of irrigation and reclamation. * * *

Since the purpose is solely to irrigate lands in another state, it is not material that the headgate is to be located but a short distance above the southern boundary line of this state, or that the lands to be irrigated are located just over the line in the adjoining state. It would make no difference in principle if it was proposed to divert the water from some stream in the in-

terior or elsewhere in our state much farther removed from the lands to be irrigated, or if it was proposed to irrigate lands in another state situated at a greater distance beyond our territorial limits."

He concludes by denying the right of eminent domain to the Colorado appropriator so as to make diversion in Wyoming.

Grover Irr. Co. v. Lovella Ditch Co., 21 Wyo. 204, 240, 256, 260.

The irrigation officials of Wyoming, under advice of the Attorney General, likewise refused to permit the diversion of waters in Wyoming for use in other jurisdiction.

In an opinion of January 31, 1916, to the State Engineer of Wyoming, involving an application for a permit to appropriate water in Wyoming to be conveyed across the line for use upon lands in Montana, Attorney General Preston concluded:

"On the assumption that there was no law in Wyoming granting any right, privilege or authority to the State Board of Control to be exercised beyond the jurisdiction of the state, this office has heretofore held that the State Board of Control is without jurisdiction to issue a certificate of appropriation of water for the irrigation of lands without the state.

Your request, like the question of the jurisdiction of the State Board of Control, involves a construction of the state laws relating to the application for a permit to divert and appropriate the waters of the state to be used beyond its borders; and as heretofore construed, I am of the opinion that

the State Engineer of the State of Wyoming has no jurisdiction over an application for a permit to divert and appropriate the water of the state of Wyoming, to be used on land beyond its borders, and that the approval by the State Engineer of the application above referred to would be in excess of his authority. See Walbridge vs. Robinson, 22 Idaho 236."

(e) Summary—Colorado and Wyoming.

It thus appears that each of the states of Colorado and Wyoming have adopted the following fundamental principles of state government:

That the state has full sovereign control and jurisdiction over the waters within its borders and that all such waters are the property of the state to be by it disposed of as it may elect in accordance with its natural conditions and the necessities of its people.

That in permitting usufructuary rights to the citizens of the state, the rule of priority of appropriation to the extent of beneficial use shall control as between such appropriators; and

That the use of the waters of the state, so under its control since its admission to the Union, are exclusively in the state and its citizens and are denied and prohibited to other states or the citizens thereof.

While it might be said that, when the United States admitted Colorado and Wyoming to the Union and recognized and approved the provisions in their constitutions declaring state and public ownership of the waters within their respective boundaries, the United States thereby consented to the said

provisions in their constitutions and the acts of admission amounted to grants from the United States to the states respectively (Farm Investment Co. v. Carpenter, 9 Wyo. 110, *supra*), nevertheless we believe that each of the states of the Union, including Colorado and Wyoming, standing as they do upon an equality one with another, and with all other states of the Union, do not derive their sovereign jurisdiction over the waters within their respective borders by grant from the United States, but rather that such jurisdiction was among the powers reserved by the states and not granted to the United States in the Constitution, either by express terms or necessary implication. (Stockman vs. Leddy, 55 Colo. 24; Kansas vs. Colorado, 206 U. S. 46; United States vs. Hanson, 167 Fed. 881).

The original thirteen states were in all respects independent nations at the time of the formation of the Union and none of them surrendered the waters within their borders or the jurisdiction and control thereof to the United States, save for regulation of navigation, and each of the new states thereafter coming into the Union upon an equality with the original thirteen, likewise reserved unto itself the same jurisdiction and control of the waters within its borders as that retained by the original states.

By either process of reasoning, however, we find in this case two sovereign states of the Union contending as such, over the waters of a stream rising in Colorado and flowing into Wyoming, where it unites with other tributaries of the Laramie River.

Although the controversy is between sovereign states and not between mere individuals claiming private property rights, the rights of the sovereign are the more clearly revealed by brief consideration of the rights of the individual, in order that the con-

trast between the two classes of right may be the better defined.

V. EITHER RIPARIAN OR APPROPRIATION DOCTRINES ARE BUT RULES OF PRIVATE PROPERTY.

We believe that sufficient already appears to justify the conclusion that either the doctrine of riparian rights or the doctrine of appropriation are, at most, rules of law for determining private property rights of citizens of the various states in their uses, under regulation of sovereign power, of the waters of the states according to the natural conditions prevailing in the various portions of the United States and according to the necessities of the various states and the citizens thereof.

As we shall hereafter more at length observe, either rule is one of equality or inequality before the *local* law, of the rights of one particular class of citizens to the utter exclusion of all other classes and that by either rule a certain favored portion of the people are given a right to enjoy the natural resource which is denied to the remainder of the people of the state, subject of course to various modifications of this general principle according to the will of the sovereign, the state, as expressed by its *local* laws, customs and decisions.

While the two rules are fundamentally to be contrasted and in absolute conflict one with the other, yet as the riparian doctrine has been modified and enlarged by the various states where it obtains, to meet local necessities, and the appropriation doctrine has in other states been restricted to meet the local conditions there obtaining, and in still others both rules have been adopted, enlarged and modified to meet local necessities (as in California, Kansas, Nebraska, Oregon, Etc.), we find that after all, they

define but *private property rights* of the citizen under control of the state, the former obtaining at best but a usufructuary right in the property of the latter and that, in the final analysis, the right of the individual must ever yield to the will of the state which if it so wills, may take away the usufructuary right of the citizen by eminent domain and establish an entirely new order of things.

In the light of the reasoning of this and other courts, which we have at length already quoted, it would appear unnecessary to further discuss this phase of the argument, but, out of ample caution, we shall give it limited attention condensing the presentation of authority by quoting from accredited authors to a considerable degree in order to avoid prolonged citation from the numerous decisions of the courts of both England and the United States.

(1) Riparian Rights.

Chancellor Kent thus defines the usufructuary private right of the riparian land owner under the common law:

> "Every proprietor of lands on the banks of a river has naturally an equal right to the use of the water which flows in the stream adjacent to his lands, as it was wont to run (*curre solebat*) without diminution or alteration. No proprietor has a right to use the water, to the prejudice of other proprietors, above or below him, unless he has a prior right to divert it, or a title to some exclusive enjoyment. He has no property in the water itself, but a simple usufruct while it passes along. *Aqua currit et debet currere ut currere solebat* is the language of the law. Though he may use the water while it runs

over his land as an incident to the land, he cannot unreasonably detain it, or give it another direction, and he must return it to its ordinary channel when it leaves his estate."

3 Kent Com., Sec. 439.

It will be noted that Chancellor Kent's definition limits the "equal" right to "every proprietor of lands on the *banks* of a river". Thus while the usufructuary right was "equal" as to the particular class "proprietors of lands on the banks" it was necessarily exclusive as to the remaining lands not so situate by nature. Hence, while the right is frequently termed an "equal" right, it is so only to a limited class of citizens and, as regards all the lands of the state, is an *exclusive* rather than equal right. This distinction will be found throughout the interpretation of the common law.

Blackstone said:

"For water is a movable, wandering thing, and must of necessity continue common by the law of nature; so that I can only have a temporary, transient *usufructuary* property therein."

2 Blackstone Com., p. 18.

Again:

"But, after all, there are some few things, which, notwithstanding the general introduction and continuance of property, must still unavoidably remain in common; being such wherein nothing but an *usufuctuary* property is capable of being had; and, therefore, they belong to the first occupant, during the time he holds possession of them,

and no longer. Such (among others) are the elements of light, air and water; which a man may occupy by means of his windows, his gardens, his mills, and other conveniences; such also, are the generality of those animals which are said to be *ferae naturae*, or of a wild untamable disposition, which any man may seize upon and keep for his own use or pleasure. All these things, so long as they remain in possession, every man has a right to enjoy without disturbance; but if once they escape from his custody, or he voluntarily abandons the use of them, they return to the common stock, and any man else has an equal right to seize and enjoy them afterward."

2 Blackstone Com., p. 14.

Vice Chancellor Bergen in McCarter v. Hudson County Water Co., *supra*, analyzed the law of private property rights under the riparian doctrine and in part said:

"Thus it appears from immemorial times *running water*, as one of the elements of life, health and comfort, has been esteemed common property, subject to *usufructuary* use by the owners of land over which it passed, a use which, by legal construction based upon public needs, has been from time to time enlarged to meet the demands of civilization and preserve the peace of society, but it has never been extended to the point of absolute ownership, to the detriment of a lower landowner. If diverted, it must be returned undiminished, except as to the incidental waste made necessary by the personal private use, for domestic and other

recognized lawful purposes appertaining to the land and its occupant."

While he based his decision upon the grounds, primarily, that New Jersey had the right to insist that the waters of the river should flow to the tide waters, over which she had undoubted control, nevertheless the following language is indicative of the character of the rights of the riparian owners:

> "My opinion is that, subect to the lawful transient rights of riparian owners along the banks of running streams the waters of which finally empty into a tidal stream, there is vested in the sovereign power the right to insist upon the proper riparian user of the waters therein, in order that the common right to the use of the residue, which is not private property, may be preserved for the benefit of those to whom all common property belongs; nor would the grant of every owner of land along the stream, from its source to tidewater, affect the right of the public (for which the state is but another name), for that only can be granted which the grantor hath, which is the transitory *usufructuary use*, subject to which running water is *publicis juris*. As the threatened act is an invasion of a common right, in that it will result in the removal from the state of the common property, it has a right to protest against the proposed increased diversion, and should seek to protect the public estate."

McCarter v. Hudson County Water Co.
70 N. J. Eq. 525, 531, 534.

In the same case on review, Mr. Justice Pitney discussed the nature of right of the riparian owner and found it to be but a private usufructuary estate inferior and in all respects subordinate to the paramount right and title of the state.

McCarter v. Hudson Co. Water Co., 70 N. J. Eq. 695.

Mr. Justice Holmes on review of the case before this Court, likewise treated the rights of riparian owners as mere private usufructuary estates subject to State control, in which he said in part:

> "It sometimes is difficult to fix boundary stones between the private right of property and the police power when, as in the case at bar, we know of few decisions that are very much in point. But it is recognized that the state as *quasi*-sovereign and representative of the interests of the public has a standing in court to protect the atmosphere, the water and the forests within its territority, irrespective of the assent or dissent of the private owners of the land most immediately concerned. *Kansas vs. Colorado*, 185 U. S. 125, 141, 142; S. C., 206 U. S. 46, 99; *Georgia v. Tennessee Copper Co.* 206 U. S. 230, 238. * * It appears to us that few public interests are more obvious, indisputable and independent of particular theory than the interest of the public of a state to maintain the rivers that are wholly within it substantially undiminished, *except by such drafts upon them as the guardian of the public welfare may permit* for the purpose of turning them to a more perfect use. This public interest is omnipresent wherever there is a state, and grows more

pressing as population grows. It is fundamental, and we are of opinion that the *private property* of riparian proprietors cannot be supposed to have deeper roots. Whether it be said that such an interest justifies the cutting down by statute, without compensation, in the exercise of the police power, of what otherwise would be private rights of property, or that apart from statute those rights do not go to the height of what the defendant seeks to do, the result is the same. But we agree with the New Jersey Courts, and think it quite beyond any rational view of riparian rights that an agreement, of no matter what private owners, could sanction the diversion of an important stream outside the boundaries of the state in which it flows. The *private right to appropriate* is subject not only to the rights of lower owners but to the initial limitation that it may not substantially diminish one of the great foundations of *public* welfare and health."

Hudson Co. Water Co. vs. McCarter, 209 U. S. 349, 355.

The mere private, usufructuary property rights of the riparian owner as compared with the paramount and superior right of the state, are learnedly discussed and distinguished by Mr. Justice Peckham in an earlier case, wherein he affirms the rule that the extent of the exercise of the private right is a matter of local law with the several states of the Union.

St. Anthony Falls Water-Power Co. vs. St. Paul Water Comm. 168 U. S. 349.

Mr. Justice Brewer said:

> "It is the settled rule that the question of the title of a riparian owner is one of local law."
>
> Whitaker vs. McBride, 197 U. S. 510, 511.

The late Mr. Kinney in the 2nd Edition on "Irrigation and Water Rights," Part VI, Chapters 21 to 28 incl. Vol. 1, elaborately discussed the common law rule of riparian rights (1) as it prevailed in England, (2) as enlarged under control of the several states of the United States, where adopted, to suit local conditions and necessities, and in some of which it has been so enlarged as to permit use thereof for irrigation, even to the extent of largely consuming the waters of the stream, contrary to the original limited usufructuary right.

Throughout the treatise run the fundamental principles (1) that it is a mere rule of private property and (2) a usufructuary right, applying equally to all owners of lands touching the stream to the exclusion of all others not so situate.

We briefly quote from the two hundred pages of text:

> "The common law rights of riparian proprietors are such as grow out of, or are connected with, their ownership of the banks of the streams and rivers, or other bodies of water. (p. 760.)
>
> In general riparian rights are incident to the ownership of the banks of a stream, or the shores of some other body of water, which the riparian owner possesses exclusively, distinct from the rest of the public, by reason of the fact that his land is so sit-

uated that it touches the waters. All the facilities which the location of his land, with reference to the body of water, affords he has the right to enjoy for the purpose of gain or pleasure, and these oftentimes give property thus situated its chief value. It is evident from the nature of the case that these rights of user and of exclusion are connected with the land itself, grow out of the location, and can not be materially abridged or destroyed without inflicting an injury upon the owner which the law should redress. It seems unnecessary to add the remark that these *riparian rights are not common to the citizens at large*, but exist as incidents to the right of the soil itself adjacent to the water. In other words, according to the uniform doctrine of the best authorities, the foundation of riparian rights, *ex vi termini*, is the ownership of the bank or shore. In such ownership they have their origin. (p. 762.)

'Riparian rights,' according to the strict meaning of the phrase, are such as follow or are connected with the banks of streams or rivers. These rights are a species of property, which belong to the owner of the bank or banks of a stream, and do not depend upon the fact as to whether or not he is the owner of the bed; neither do they depend at all upon the fact as to whether the owner actually uses any of his rights or not, provided he has not lost any of them through grant or prescription.

* * * * * * * *

Unlike the rights acquired to the use of water under the Arid Region doctrine of appropriation, riparian rights require no act upon the part of the owner, with the exception of the acquisition of the land adjoining such waters. These rights, in those jurisdictions where the common law is followed in this respect, are attached to the land itself and are a part and parcel of it. As an incident to such estate they pass by a deed to the land, unless specifically reserved by the grantor. (p. 765.)

One of the most important rights which a landowner has by virtue of his riparian ownership is the right to the *use* of the water as it flows by his land. Although this is a property right, accorded to him by virtue of the natural position of his land upon the stream, as in the case of public waters, this property right is in its nature usufructuary. A riparian owner has no absolute title to the water itself of a stream as it flows by his land. He may, however, have the right to apply it to certain uses.

* * * * * * * * *

All the riparian owners, through or by the side of whose land a stream naturally flows, may enjoy the privilege of using it. * * * The rights of all riparian proprietors upon a stream are equal. * * *

In fact, the water must be so used by any one that no injury will result to the other owners or to any one of the other owners. This is the necessary result of the perfect equality of right among all of the proprietors. (p. 769.)

> The riparian owners also have some duty to the public. While the rights of the riparian owners can not be destroyed by the public without just compensation, *they are always subordinate to the public rights*, and the state has the power to regulate their exercise in the interest of the public." (p. 771)

Of modification and enlargement of riparian rights to meet local necessities, especially in the Pacifi Coast States (not the states of the Rocky Mountain Region), he said:

> "In some of the States and Territories of the Western portion of this country, riparian rights as defined by the common law have been entirely abolished; we will add that in others they have been modified to a great extent, and in still others they exist with but few modifications as they are interpreted by the Courts of England and the Eastern States. We have also shown in previous sections, that although irrigation of the soil under certain circumstances was perhaps allowed under the strict application of the common law theories, it was so restricted by certain rules and restraints placed upon its practicable workings that these theories unmodified were found to be wholly inapplicable to irrigation as it is known and applied in the "Great Arid West." In that part of the country, in order to make the soil productive, there must be an application of the waters of the streams upon it. In order to apply it to the soil there must be an actual diversion from the natural stream; and, owing to the porous soil, the hot sun, and dry atmosphere,

a certain loss or diminution in quantity must necessarily follow as a result of its application and use for irrigation. Hence, in all of the states and territories in the arid West, even in those where the common law theories are most strongly applied to riparian rights, there has been a modification of these theories to this extent, that a riparian proprietor may take water from the stream and may make a reasonable use of it for purposes of irrigation. It is considered in the Pacific states that irrigation must be held in that climate to be a proper mode of using water by a riparian proprietor and the lawful extent of the use depends upon the circumstances of each particular case. In other words, the right of a riparian proprietor to irrigate his lands, to the extent that it is permitted under the Western American doctrine of riparian rights, is a great modification and extension of that doctrine as defined by the later English and Eastern American authorities." (p. 873.)

Of the exclusion of one class of land owner (non-riparian) for the benefit of the preferred class (riparian) he in part said:

"As we have seen, riparian rights of all kinds depend upon the ownership of the banks of the streams or other bodies of water. The lands for which they are claimed must touch upon the water. Hence it follows that one who is not a riparian owner can not use the water of a stream for irrigation as a riparian right. His claim would lack the essential element—ownership

of the bank of the stream. No person can take water from a stream, under the common law right, for the purpose of irrigating his tract of land which is separated from the stream by intervening lands belonging to other riparian proprietors. * * *

A riparian proprietor has no right to irrigate non-riparian land, by virtue of his title to other lands which touch upon the water of a stream and therefore are themselves riparian. Whatever may be his right to a reasonable use of the water of the stream to irrigate his riparian land, he has no right to conduct any of the water to irrigate other lands not riparian. In this respect the common law as it is enforced in England and in the Eastern States is in accord with the Western American Doctrine.

* * * * * * * * * *

As we have seen in previous sections, it is by a strained construction of the common law upon the subject that irrigation is permitted to the extent that it is practised in the Western states, as a riparian right." (p. 898.)

Kinney on Irrigation and Water Rights, (2nd Ed.) Ch. 21 to 28 incl.

Mr. Wiel, in the 3rd Edition of his "Water Rights in the Western States," devotes Part IV, as well as previous portions, to an elaborate discussion of riparian rights. Such rights are there defined as merely usufructuary and private property for the benefit of one class of land owners (equal among themselves) to the exclusion of all other landowners. He in part says:

"While the law does not regard the liquid itself as property while flowing naturally, any more than the air, it recognizes nevertheless, a very substantial right in its flow and use; the rights to have the liquid flow and to use and take of it; which the law calls *usufructuary right*, or 'the water-right.' * * * And says Story: 'But, strictly speaking, he has no property in the water itself, but a simple use of it while it passes along.' And Kent: 'He has no property in the water itself but a simple usufruct as it passes along.' In a Nebraska case it is said: 'The law does not recognize a riparian property right in the *corpus* of the water. The riparian proprietor does not own the water. He has the right only to enjoy the advantage of a reasonable use of the stream as it flows by his land, subject to a like right belonging to all other riparian proprietors.'" (p. 754.)

Of the exclusion of non-riparian owners for the benefit of the limited class (riparian owners):

"Having alone the accecss, the riparian proprietors alone have the right to take of the water. * * * All but riparian proprietors were thus shut out from the stream, * * * The law of riparian rights grows out of this exclusion of non-riparian owners because they have no access to the water.

Lawful access was given by the ownership of riparian land, and being so given, was equally afforded to all the riparian owners. Since all have an equal right to access. They all consequently have the same and

equal right to take and use the water." (p. 759.)

And further:

"Unlike an appropriation, riparian rights need no act of the owner to acquire them, they attach to the land bordering on the stream of their own accord. The riparian right is a privilege that is part and parcel of the riparian land that gives the access to the water; the right of access and all that follows from it being an inseparable result from ownership of the land like the right of support for the land. The riparian right is inherent in the riparian land and part and parcel of it; an inherent result of the relative position of the land to the stream as a natural resource. * * * The right is 'an *incorporeal* hereditament appertaining to the free hold.'

* * * *The riparian right, like the right by appropriation, is solely usufructuary,* * * * The right is to a flow and use merely, * * *

This usufruct is perpetually annexed to the riparian land whether availed of by irrigation or other works or not at all; just as the right of the landowner to build a house on the land remains though no house is ever actually built." (p. 777-81.)

After devoting Chapters 31 and 32 to the application of the rule according to the local necessities of various states, he devotes Chap. 33 to limitation of use between riparian owners, saying:

"Speaking generally, non-riparian owners are *excluded entirely* from rights in

> the stream, and riparian owners are given rights only for use on their own riparian land; they also cannot take the water to non-riparian land, whether it be their own or someone else's. * * * The limitation to riparian land arises, first, by the *exclusion* of non-riparian owners because their lands have no access to the water; second, because he who has access (the riparian proprietor) can excuse the damage (which any taking may cause to the land of other riparian proprietors) only on the ground of reasonable use of his own land." (p. 832.)

Without further citation, we trust sufficient appears to justify the conclusion that the riparian doctrine is but a rule of private usufructuary right to the use by the citizen of waters of a sovereign state, subject at all times, as all other property of individuals, to the regulation and control of the state and varying in the states of the Union where adopted, according to local law as local conditions and necessities require in order that the state may obtain the greatest good from her natural resources.

(2) Rights by Appropriation.

Rights by appropriation in the order of priority are directly antagonistic to riparian rights. The one is based on the title to the banks with incidental uses of the water, and the other on use of the water upon any lands (riparian or non-riparian) irrespective of location and the claims of other appropriators junior in point of time. Yet, as we shall observe priority by appropriation is, like the riparian doctrine, but a rule of private property of individuals under like control of the sovereign state, and such

are likewise but usufructuary rights in the public property (the water).

To cite authorities would appear needless for *the very basis of all rights by appropriation is beneficial use.* The rule is well expressed in Sec. 8 of the National Reclamation Act:

> "Beneficial use shall be the basis, the measure and the limit of the right"

and *all rights* by appropriation must, therefore, of necessity be *usufructuary.*

But, inasmuch as the character of such a right is, after all, largely the question here involved, we pause to briefly consider the source and character of this property right, and to first determine its fundamental principles and its place among the mere private property rights of individuals, before proceeding to a discussion of whether or not this rule of the law of private property may be applied to a determination of the sovereign rights of states.

Rights by priority of appropriation are as exclusive in their nature (but in a different manner) as are rights under the riparian doctrine. Under the latter, we have observed, the waters are limited to the one class of land owners (the bank owners) to the exclusion of the rest of the citizens of the state (owners of non-riparian lands) while under the rule of appropriation, the right of the first taker to the use of the water of the stream, to the extent of his beneficial use and upon lands whereever situate, is exclusive of the rights of all others who may wish the water, with the limitation that the first taker must apply the water within a reasonable time, must not divert more than his necessities actually require and must not enlarge his demands on

the stream to the depletion of the supply of his juniors. But, if the first appropriator's necessities actually so require he may take all the water of the stream to the exclusion of all others.

(See Sup. Brief Wyoming, pp. 134-140. The right of the prior appropriator is exclusive).

Both these general rules of exclusive use (riparian and appropriation) are after all but usufructuary in their nature, are but rules of private property of the citizen and are regulated, controlled, modified, abolished or re-established by the state according to the local conditions and necessities and at the will of the sovereign power. As stated by Mr. Justice Brewer in *United States vs. Rio Grande Irr. Co.*, (174 U. S. 690, 702):

> "While this is undoubted, and the rule obtains in those states in the Union which have simply adopted the common law, it is also true that as to every stream within its dominion a state may change this common law rule and permit the appropriation of the flowing waters for such purposes as it deems wise."

And by the same learned Justice in *Kansas vs. Colorado* (206 U. S. 46, 94):

> "It may determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid region of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any state."

Mr. Wiel, in the 3rd edition of "Water Rights in the Western States" classes rights to the use of

water under either doctrine as mere rules of private property, usufructuary in character, and under state control:

> "The law of watercourses is a law of streams as natural resources. The water running therein unrestrained is the property of no one, but a portion of it taken out of the stream and confined in the possession of an individual becomes the taker's private property, belonging to him while under his posession and control; and the law of watercourses is a development of the rules under which one may thus take of the water and make it his own. There is a large body of law specifying *who* may avail themselves of this privilege and to what limitations they are subject, forming in the common law, 'the law of riparian rights,' and in the West, 'the law of prior appropriation.' (p. 1).
>
> The result of these authorities is that the *corpus* of naturally *running water*—the water in the natural resource—was classed in the Institutes and civil-law writers with the air, and those things which cannot be owned while in their natural state and condition, or as they have been called, the 'negative community.' * * * However, as an outgrowth of this variation of the idea of the 'negative community'—the change from 'common' to 'public'—there is quite generally today a tendency to substitute the positive expression that running water belongs to the state in trust for the people or the public, in analogy to a similar change in the way of stating the law regarding wild game, and the law of the beds of navigable waters.
>
> * * * * * * * * *

In nearly all now of the Western states this change of expression is, by statute, introduced regarding running water. All waters within the state are declared to be 'the property of the public' (or to 'belong to the public'). * * * there are also declarations that waters are 'the property of the state.' * * * however, there is no substantial difference in the two forms of expression (that is, whether common or public; *res communes* or *publici juris*; the property of no one or the property of the state in trust for the people). *So far as they concern the private rights of individuals, whether under the law of appropriation or the common law of riparian rights,* both are founded on the ancient view taken by the law that running water unrestrained in its natural course belongs to the 'negative community.' (p. 4-13).

While the *corpus* of naturally running water is thus in the negative community and not the subject of private ownership (or 'belongs to the public'), the law recognizes nevertheless a very substantial right in its flow and use,—the right to have the liquid flow and to use it, which the law calls usufructuary right,' or the 'water right.' The law of watercourses consists of the rules governing this right of flow and use of the natural resource." (p. 14).

After discussing the authorities on the usufructuary character of riparian rights he continues:

"*The right of an appropriator under the western law of prior appropriation is*

governed by the same principle. Nothing is more firmly settled in the West than the rule that an appropriator can have no ownership in the water, as such, in the natural stream above head of canal or ditch, and that his right is solely one to have the stream water flow to his ditch so that it may be used.

This principle of a *private* right in the *use* of the natural resource as distinguished from the substance itself is taken from the law of 'usufruct' in the Institutes, and is well recognized today. This usufructuary right, or 'water-right' is the substantial right with regard to flowing waters; is the right which is almost invariably the subject matter over which irrigation or water power or similar contracts are made and litigation arises; and is real property. *It is as fundamental under the law of riparian rights as under the law of appropriation.* Under the latter the right of use lasts only while in actual application. Under the former the *right* of use is perpetual whether actually excercised or not; it is perpetualy annexed as a privilege to the riparian freehold, to be put into actual exercise whenever its owner will, or not at all, but none the less a mere right of use, present or future, including no ownership of any drop of the water while it continues flowing naturally. * * *

The law of watercourses under whatever system (whether appropriation or riparian rights), borrowing from the civil law, is but a development of the exercise of the *usufructuary* right, and of the severance in pursuance of it, of a portion of the water from the natural stream. (p. 19).

A *water-right is a usufruct in the stream*, the natural resource, consisting in the right to have the water flow so that some portion of it (which portion the law limits in various ways under the system of prior appropriation or the system of riparian rights) may be reduced to possession and made the private property of an individual.

* * * * * * * * * *

The nature of the right of ownership existing in naturally running water is that of having it flow, of using it, and of taking it into possession by diverting it into artificial structures, ditches, reservoirs, cisterns, barrels, canals, pipes, and the like, thereby making private property of a part of it, during the time it is held in possession and control." (p. 22).

After discussing the temporary character of property in water severed from the stream:

"The value of the foregoing lies in showing that the *corpus* of water in the stream itself, as a substance, is not the subject of property (is in the 'negative community' or 'belongs to the public'), and that one may have only the strictly usufructuary right to the flow and use of the stream. * * controversies must, as a rule, be decided with regard to the flow and use of the natural water supply, and not its *corpus*; for the usufruct of the natural resource (and not the water itself) is alone of practical importance.

This is having much influence in the West under the law of appropriation, *which*

forcefully denies that a water user has any ownership in the water of the stream, from which he diverts (that 'belongs to the public'), but only a right to continuance of supply from the natural resource during the beneficial use. Under the common law of riparian rights the principle is as true—a riparian owner also has no ownership of the water of the stream to which his land is riparian. He also has only a right of continuance of supply, though this right of a riparian owner differs from the law of appropriation, in that it is confined to periods of use, but is perpetually reserved to his land,—a perpetual right to have the supply from the natural resource continued for future possible use whether now used or not." (p. 45.)

Of the elements of law of prior appropriation by way of introduction:

"In the law of watercourses the rules governing the usufruct in natural streams form the bulk of the law. The law of watercourses is a law of natural resources. We shall deal with this body of law under two systems prevailing in the Western states; first, the system of prior appropriation (the system of priorities), which gives unequal rights in streams according to the relative times of beginning use; second, the common law of riparian rights (the system of correlative rights), which gives equal rights to all riparian proprietors without regard to the relative times of beginning use." (p. 287).

He then quotes Blackstone B. II, Ch. 25, on the rule of common law, and says:

> "The right of an appropriator is likewise only usufructuary. Although for shortness' sake, the appropriator is spoken of as the owner of the water, yet there is no property in the water itself nor in the channel of the stream conferred by the appropriation; the appropriator owns only a right to have the *flow and use* of the stream, which is called his 'water-right.' The stream water itself is in the 'negative community,' the property of no one; or, by the recent Water Code form of expression, 'belongs to the public' or to the 'state in trust for the people.' " (p. 289.)

And further:

> "As opposed to the correlative rights of the common law, whereby all riparian owners on the stream have equal rights, under the law of appropriation the rights of the claimants are unequal. Each has an exclusive right to the extent of his prior appropriation, and appropriations vary greatly in the extent of right appropriated. 'A party appropriating water has the *sole and exclusive* right to use the same for the purpose for which it was appropriated.' So long as the water is put to a beneficial use, priority alone governs. Full protection is given to the prior appropriator against all later comers. * * *
>
> The right to exclusive use carries with it such right to exclusive flow as is necessary to preserve the appropriator's use

without damage to his use; but is not violated by any act that does not interfere with his use of the water. The right to the flow is subordinate to the right of use, and cannot exceed it." (p. 291.)

Of the extent to which an appropriator may divert the stream:

"If for a beneficial purpose, one may hence appropriate a *whole* stream. An appropriation is limited to beneficial use, but may absorb a whole stream to that end. 'Under such doctrine the first appropriator may appropriate the entire flow of a stream, if used in proper irrigation. Also, *a non-riparian owner may appropriate and get an exclusive right to the whole water of a stream for non-riparian lands.*' Another says: 'Beyond question, under our laws (Idaho), a party may be protected in the use of all the water he actually appropriates and uses, even if it be every drop that flows in as great a river as the Snake.'

In times of natural or other deficiency, also, unless otherwise provided by statute, the prior appropriator may still claim his full amount; the loss must fall on the later appropriators." (p. 311).

The late Mr. Kinney in Vol. 1 of the 2nd edition of his work on "Irrigation and Water Rights" treats the title of the appropriator as a usufructuary right of private property under the sovereign control of the state:

"We have seen in previous sections that, in this country it is within the power of

a state to declare whether the ownership of the soil under its waters shall remain in the state, or shall vest in the riparian owners.

* * * * * * * * *

In this chapter we shall attempt to show that the common law in many of the Western states has been modified by a declaration either in their respective constitutions or by legislative enactment, to the effect that the waters within such respective jurisdictions are 'the property of the state' or 'the property of the public.' Respecting the declaration that the waters are 'the property of the state' or 'the property of the public,' the Courts hold that these two terms are synonymous. As was said by the Court: 'There is to be derived no appreciable distinction, under the doctrine of prior appropriation, between a declaration that the water is the property of the public and that it is the property of the state.' What is really meant by the above expressions is that the running water is *publici juris*, or open to the people of the respective states for appropriation for beneficial uses or purposes. As was said in a Wyoming case: 'Under the rule permitting the acquisition of rights by appropriation the waters become, perforce, '*publici juris.*' " (p. 632.)

Of causes leading to dedication of water to the state with usufructuary titles (beneficial uses) in the individual, he said:

"Owing to the climatic conditions, the search for gold, and the exceeding fertility of the soil, settlers were attracted to these

arid regions, and the use of the water by diverting it from its natural channels and applying it to some beneficial purpose continued. When the population of certain sections had increased to such an extent as to make it practicable, territorial governments were formed, including certain portions of this region, and these were followed by state governments. * * * In a number of these states, in the constitutions themselves, there was a provision made dedicating all the waters within the state to the public, or to the state. * * * By this doctrine it is seen that the title to the use of the water is in the public, or the state, *which in turn, under its regulative or police powers, may prescribe by legislative enactment the details as to how an individual or corporation may acquire the right to the use of a portion of the water.*

* * * Coming down to the rights of the appropriator, in a jurisdiction where there has been an absolute dedication of its waters either to the public, as is the case in Colorado, or to the state, as is the case in Wyoming, it is held that the appropriator secures a right of use, which has been held, with good reason, to amount to a property right, and not a title to the running water itself, except, it may be, to such quantity as shall from time to time be lawfully diverted into his own ditches. *The title to the water of the appropriator fastens, not upon the water while flowing along its natural channel, but upon the use of a limited amount thereof for beneficial purposes* in pursuance

to an appropriation lawfully made and continued. The appropriation is made upon the basis that the public or *state is the owner* of the waters, and is protected, instead of impaired, by the constitutional dedication." (p. 635).

Of the effect of state regulation of private usufructuary rights to water and variation of the laws among the states:

"It will be noticed that in the dedication to the state, or public, the constitutions and statutes of the respective states, quoted in the preceding sections, vary greatly in the terms used. * * * some follow in certain features the California dedication, and others Colorado and Wyoming, while still others take positions somewhere between, depending largely as to whether or not it was the object to abolish the common law or riparian rights.

As we have seen, *it is left to each state to adopt whatever rule it sees fit relative to the use and control of the waters within its jurisdiction*, so long as the rights of the government are in no way impaired. And, as there was no general rule or guide upon the subject which a state was bound to follow, each state has adopted a rule of its own. In fact, *there are no two states where the laws are the same.* Some states may follow California in their main features, others may follow Colorado, but it will be discovered that each state has independent features of its own; and hence it follows that no state has a rule which in all of its features

will apply to any other state. The different grants in the dedications of the waters, of course, give different rights to the use of those waters, either by the public or by individuals. And these dedications, either being in the constitutions or by positive legislative enactment, are the fundamental laws upon the subject, and they themselves being different, have led to the enactment of different laws and different systems in various states. There are, however, many features in common, which will be discussed in the subsequent portions of this work. But to speak of the California rule or doctrine, or the Colorado rule or doctrine, is incorrect, unless the expression is used in the popular sense, except as the same may apply to the particular states of California or Colorado themselves, as each state has a rule or doctrine of its own. There is, however, the doctrine of state control or the state administration of waters, which is based upon the dedication of the waters within a state, either to the state itself or to the public, and has been adopted by many of the Western states. *But even the laws of state control differ greatly in the different states. Different rights are granted, different methods of the appropriation of water provided for, and entirely different powers given to the state officers who administer the law upon the subject.*" (p. 654).

He thus defined the doctrine of appropriation:

"The Arid Region Doctrine of appropriation may be defined as that doctrine or

> rule of law which has grown up in this Western portion of our country, governing the use of the water of the natural streams and other bodies, by its appropriation for any *uesful or beneficial purpose*, based upon the physical necessities of the case; and, whereby for the purpose of applying the water to some *beneficial use*, the water must be diverted from its natural channels, and, in contradistinction to the strict construction of the common law of riparian rights, the place of use may be on either riparian or non-riparian lands, and the right based upon priority." (p. 1009.)

After discussing the reason for the rule to be the "imperative necessities" of the western states, and the variations in the rule as adopted or only partially adopted in each thereof, he continued:

> "The control as a sovereign, of the waters within the boundaries of a state is left entirely to the state itself. Each state has the power either by legislative enactment, or by court decision, to adopt such a rule governing the waters flowing or standing therein, as it sees fit. A state may adopt the common law of riparian rights only, as has been done in the Eastern states. And, in this connection it may limit and define the rights of riparian owners in and to the waters of such streams and to the soil lying under the same. A state may also adopt a modified form of riparian rights allowing a more extensive use of the waters of streams, especially for irrigation, than was allowed under the strict rule of the common law. This has been done in California,

and some of the other Western common law states.

Again, a state may entirely abrogate the common law of riparian rights, and adopt in lieu thereof the Arid Region Doctrine of Appropriation, as defined in this chapter, and as enforced, as set forth in the following chapters of this part.

And, still again, a state may retain the common law of riparian rights, and at the same time adopt the Arid Region Doctrine of Appropriation, and thus have the dual systems of laws governing waters, within its jurisdiction.

As far as the United States Government is concerned by those various Acts of Congress, fully discussed in future portions of this work, it has waived its rights as sovereign in and to the government and control of the waters flowing or standing within the boundaries of any state, and has conferred the jurisdiction of such waters upon such state. * * *

It has also become the settled rule of law of the Federal courts that such courts will adhere to the rule that *each state has the right to adopt such law or laws,* as it sees fit governing and controlling the waters and the use thereof within its boundaries, and that the Federal courts will follow in their decisions the rule or rules so adopted by such jurisdiction. This is true whether that rule of law is adopted by such state by statutory enactment, or by decisions of its highest court. In other words, such state may

decide for itself, as to the applicability or inapplicability of the common law rule as applied to the physical conditions of such State; and, if such rule is determined to be inapplicable, the state, in lieu thereof, may adopt such other rule as it sees fit governing the entire subject of waters and their uses within its boundaries." (p. 1025).

A "water right" is thus defined:

"A water right, acquired under the Arid Region Doctrine of appropriation, may be defined as the *exclusive*, independent property right to the *use* of water appropriated according to law from any natural stream, based upon possession and the right continued only so long as the water is actually applied to some beneficial use or purpose; it is an incorporeal hereditament, so far as it includes the right to have the water flow over the lands of others down to the head of the appropriator's ditch; but the water is a corporeal hereditament after it has been once taken into the ditch or reservoir of the appropriator and is in his actual possession for the purpose of application to his uses." (p. 1313).

The water right is exclusive:

"In our definition of the term "water right" under the doctrine of appropriation, we said that it was an exclusive right. This is one of the most important distinctions between the right to the use of the water of natural streams under the common law of riparian rights and under the doctrine of appropriation. Under the common law the

right to the use of the water by one individual depends upon the equal or correlative rights to its use by all of the riparian owners upon the same stream." (but of course is exclusive to one class as against another class of citizens). "In this dry and arid country, where the water is exceedingly scarce and there is not enough for all, instead of following the common-law rule as to its use, or 'parceling it out generally and making it practically valueless to any,' in the early days of the settlement of this portion of the country, there was adopted the only rule founded in equity that could be rightfully adopted in the premises, based upon priority of the appropriation. He who first appropriated a certain amount of water from a natural stream should be rewarded for his industry and enterprise by the right to the use of the water to the full amount of his appropriation as long as he applied the same to some beneficial use or purpose, and to the exclusion of all others where they interferred with his right. * * * an appropriator has the several and exclusive right to the use of the water included within the extent of his appropriation." (p. 1314.)

The usufructuary right is governed by state laws:

"One of the essential elements of a water right is that the water upon which it is based must have been appropriated *according to the law of the states where the* appropriation is made. * * * If there is a statute or a water code in the state

where the appropriation is attempted, its provisions must be strictly complied with in order to secure the benefits allowed under it." (p. 1316).

The right is a mere possessory right:

"a water right in early times was considered and was merely a possessory right. And today a water right is but a possessory right. Upon the other hand, statutes have been enacted whereby the owner of a mining claim having but a possessory right thereto can secure an absolute title in fee to the same. There is no law whereby a possessory owner of a water right can secure an absolute title in fee to his right. The title to a water right has never been 'elevated to the dignity of a fee.' And, furthermore, the right is but a conditional possessory right; the possessory right depending upon the condition that all of the water claimed under the right is continually applied to some beneficial use or purpose. With the failure to comply with the condition of use for a certain time the right terminates, and it is either deemed abandoned, or forfeited under a statute, as the case may be. This is as it should be. If the law were otherwise, and if a person could secure the absolute title in fee to a water right, calling for a definite amount of water flowing in a certain stream, and then continue to own and hold the same, and that, too, whether he applied the water to any beneficial use or purpose or not, and thereby prevent others from using the water, it

> would subvert and overturn the whole system of the doctrine of appropriation as it is in force today. It is true that a water right has acquired the dignity of real property, but real property is owned and held by many kinds of title, the one highest in degree being an absoulte title in fee simple. If the law remains as it is no one can hope to secure an absolute title in fee simple to a water right, but he may, as long as he complies with the condition of applying the water claimed to some beneficial use or purpose, acquire an exclusive possessory right." (p. 1317).

and is conditional on *continuous use*:

> "Not only must there be an actual application of the water to some beneficial use or purpose * * * before the possessory title to the water right is acquired, but the continuation of the right is also conditioned upon the continuous use of the water. In other words, *the right is merely usufructuary*, and the right to the water lasts so long as it is in actual use and occupation, but no longer. The property in the water escapes and is out of his possession, and another man may appropriate it to his own use. The same is true also as to the water right itself * * * if the water claimed under the right is not used for a period of time sufficient to work an abandonment or forfeiture, the right ceases in the original appropriator, and the water claimed by him under it may be appropriated by others. But as long as the first appropriator holds possession of the right by the use

of the water claimed under it his possessory title is good, and exclusive in himself, as against all later comers, and the water right arises to the dignity of a distinct, exclusive usufructuary estate." (p. 1319).

May irrigate lands irrespective of location:

"Contrary to the rule of riparian rights at common law, where the right to the use of the water is dependent upon the ownership of the land adjoining which or through which the stream flows, *a water right based upon the doctrine of appropriation in the Western states does not depend upon the legal title, nor, in fact, upon any title to or the possession of lands* on the streams or other bodies of water, or elsewhere. But a water right is simply an exclusive possessory right, acquired by the diversion of the waters of a stream in a lawful manner, and the application to some beneficial use or purpose. * * * A valid appropriation may be made for the irrigation of lands, or for any other beneficial use, not situated upon or near the stream from which the water is taken. The very object of the appropriation may be to conduct the water from the stream through a ditch or canal, across the intervening lands, to irrigate a tract of land which the appropriator possesses far from the natural stream. * * * In other words, the *universal rule* is that a water right, or the right to the use of the water, under the doctrine of appropriation, is not in any way dependent upon the *locus* of its application to the beneficial use designed." (p. 1323).

It is a property right:

> "The distinct, exclusive, usufructuary estate acquired by an appropriator to the use of water, by its lawful appropriation, is property of the highest order, and oftentimes of the highest value." (p. 1326).

It is an incorporeal hereditament:

> "A water right is descendible by inheritance; and, being neither tangible nor visible, it is an incorporeal hereditament." (p. 1333).

And the first appropriator may take all the water of the stream:

> "the first appropriator on a certain stream is entitled, by virtue of his prior right, to the use and enjoyment of the water to the full extent of his original appropriation, even when this includes all of the water of the stream, and this right continues so long as he applies all of the water appropriated to some beneficial use or purpose. * * *
>
> The appropriator can not exceed the amount of water covered by his appropriation and thus cut out the rights of others." (p. 1357 and many cases cited).

And the usufructuary property right may be taken under eminent domain for other and preferred public uses.

> (Chapter 55, pp. 1900-1976 incl.)
>
> Kinney on Irrigation & Water Rights, 2nd Ed. Vols. I and II at pages above cited.

We have quoted copiously from the above authors to avoid elaborate citation to the numerous decisions of the courts, which will be found in the foot notes to the various portions of the text quoted, and all of which announce and affirm the principles above set forth.

Both Colorado and Wyoming recognize the usufructuary right of the appropriator as a private property right in the waters held by the state in its sovereign capacity.

The late Justice King thus tersely defined a water right under the Colorado law:

> "In determining this question we have to consider the peculiar nature of the property designated a 'water-right,' and the title thereto, as distinguished from land. This 'right is said to be intangible and incorporeal.' The ultimate title or ownership of the water of the natural streams of this state is, by the constitution, vested in the public, but dedicated to the use of the people, subject to appropriation. * * * The right is usufructuary. There is no property in the corpus of the water so long as flowing naturally. There is no property in the channel of the stream, and the water-right is distinct from the right to the ditch, canal or other structure in which the water is conveyed. The original right and title is secured by apropriation."
>
> Monte Vista Canal Co. vs. Centennial Irr. D. Co., 22 Colo. App. 364, 368.
>
> See Art. XVI, Sec 5, Colorado Constitution (*supra*).

Wyoming, by statute, thus defines the usufructuary private property right of the appropriator and its relation to the sovereign right of the state:

> "A water right is *a right to use the water of the state*, when such use has been acquired by the beneficial application of water under the laws of the state relating thereto, and in conformity with the rules and regulations dependent thereon. Beneficial use shall be the basis, the measure and limit of the right to use water at all times, not exceeding in any case, the staututory limit of volume. *Water being always the property of the state*, rights to its use shall attach to the land for irigation, or to such purpose or object for which acquired in accordance with the beneficial use made and for which the right receives public recognition, under the law and administration provided thereby."
>
> Wyo. Comp. Stat. (1910) Ch. 58, Sec. 724, p. 247.
>
> See Wyo. Const. Art. VIII, Sec. 1 to 5 incl. *supra*.
>
> Farm Inv. Co. vs. Carpenter, 9 Wyo. 110.

Without further citation of authorities, we think sufficient appears to define the character of the property rights of the water user under both the riparian and appropriation doctrines.

Rights acquired under either system are usufructuary private property interests of the individual citizens (the land owner or appropriator) under the control of the state and at all times inferior and subordinate to the greater, the sovereign right of

the state. Such rights being mere private propetry, the law thereof is law of private property and cannot be taken as defining the greater rights of the states within which such private usufructuary rights of citizens are acquired, enjoyed, regulated and controlled, or by which such private rights may be taken away at any time under the power of eminent domain. Their interpretation involves consideration of their relations to one another or to the sovereign state under which they are acquired and enjoyed, or by which they may be taken away, and rules which the state may fix for regulation of these private property rights of its citizens cannot have extra-territorial force, either in behalf of or against the state but are purely local law and subject to change or repeal.

Story Confl. Laws, Ch. 2, pp. 19-34;
Pennoyer vs. Neff, 95 U. S. 714, 720-22.

And this local private law is recognized and applied *within* the respective states by the Federal as well as the local courts.

Hardin vs. Jordan, 140, U. S. 371.
Whittaker vs. McBride, 197 U. S. 510.
Boquillas Cattle Co. vs. Curtis, 213 U. S. 339.

Of the effect of attempting to apply this local law to controversies between sovereign states, in no two of which the rules and laws are identical, we shall treat at length in the next portion of this brief.

VI. PRINCIPLES OF PRIOR APPROPRIATION CANNOT APPLY WITHOUT REGARD TO STATE BOUNDARIES.

We now come to a discussion of the vital question involved and thus stated in the order for reargument:

> "Whether the rights asserted are to be tested and determined solely by the application of the principles of prior appropriation, without regard to state boundaries, or whether, on the contrary, the general principles of prior appropriation are subject to be restricted or their operation limited in this case by state lines."

All that has been previously stated herein, is, after all, but preliminary and a premise to the discussion to follow.

In the foregoing portion of the brief we have, under separate subdivisions, treated of the fundamental rules of law involved in the following manner.

At the outset we observed that this case is not one between property owners in different states, each claiming under the law of his respective commonwealth, but rather a controversy between two sovereign states, each asserting and standing upon its extreme rights, and necessarily inclusive not alone of the property owners but as well of all the citizens of each state thereof, and involving states of equal magnitude in the Union and their future as well as their present welfare. (Pages 11 to 16.)

We next considered the law of independent nations, as regards their jurisdiction over the citizens and also the waters and all natural resources thereof, and observed that each independent nation has full, absolute and exclusive jurisdiction over all such within her boundaries. (Pages 16 to 21.)

We then observed that each of the original thirteen states was, at the time of the formation of the Union, a free and independent nation; that upon the adoption of the Constitution and thereafter,

each of such original states continued to retain all of the attributes, powers and jurisdiction of independent nations, save for those powers voluntarily surrendered to the United States by the Constitution, and that as such continuing free and independent states (in so far as here to be considered), each retained all its original powers and jurisdiction over all the waters within its boundaries, save as voluntarily surrendered to the United States for regulation of navigation. (Pages 21 to 25.)

Each new state admitted into the Union is possessed of all the powers and jurisdiction over the waters within its borders "no greater and no less" than possessed by the original thirteen states. (Pages 26 to 30.)

We then devoted many pages of this brief to a discussion and review principally of the decisions of this court, from the earliest times in our national history down to the present year, wherein we found that, with one accord, the same independent and exclusive jurisdiction over waters was recognized in the new states as had always obtained, even before the Constitution, in the original thirteen states(save for federal control of navigation); that exclusive jurisdiction extended over all such waters for navigation (with paramount control in Congress when asserted), fisheries (those that swim or those which grow upon the beds of waters), power, municipal supply, rights of and use by bank owners, irrigation (both for riparian and non-riparian lands), and for all other uses and purposes beneficial alike to the state and its citizens; that in the exercise of this power and jurisdiction, the local laws and regulations, varying necessarily in every state, have been controlled by and founded upon local conditions and necessities; and that in construing or applying the

laws governing any controversy, the United States and its courts have always followed and applied the local law of the state within which the controversy arose. Also that no powers were delegated to Congress to establish or determine laws or rules for control of waters within either the old or the new states and that even when legislating with reference to the public lands Congress has refrained from attempting to establish any laws which might embarrass the new states or infringe upon their powers and has specifically left all jurisdiction and control over waters to the states and territories. (Pages 30 to 118.)

We quoted the Acts of Congress relative to waters on public lands, and the decisions construing the same, all recognizing the inherent sovereign jurisdiction of the states. (Pages 119 to 148.)

The Constitutions, laws and decisions of both Colorado and Wyoming were cited and reviewed and we there found that each state had not only made full claim of state title, power and jurisdiction to all the waters within its boundaries (which claim had been ratified, approved and enacted as law by Congress in the Enabling acts), but, also, that each state had forbidden the use and benefit of its waters to neighboring states or the citizens thereof. (Pages 148 to 175.)

And lastly we fully discussed the doctrine of riparian rights as well as that of prior appropriation and the application and construction thereof in the several states and in Colorado and Wyoming, and there observed that both are but rules of local, private law obtaining in different degrees, either alone or in combination, in different states of the Union (in no two of which is the application of either doctrine

identical), for determining the property rights, interests and titles of citizens of the respective states, to a mere *usufructuary* property in water, in their relations with one another on the one hand and with the state on the other. Also that each of the rules is one of exclusion of one class of citizens of the state for the benefit of another limited class thereof and that both are, in truth, rules of inequality from the standpoint of the state as a whole and are but private, usufructuary property law and not in any sense rules of public, interstate or international law. (Pages 175 to 215.)

We have considered at length these various phases of the law of waters and the jurisdiction of the states in order that we may the more intelligently express our views upon the question now presented, believing that by so doing we may make plain the reason for the rules for which we contend, which otherwise might stand as mere conclusions without adequate reason or premise.

(1) RULES OF PRIVATE PROPERTY INAPPLICABLE TO CONTROVERSIES BETWEEN STATES.

With all due respect to the learned presentation of rules of the law of private usufructuary property, by counsel for Wyoming, which they contend should govern in controversies between states (not individuals), we cannot concur in their conclusions either in the ultimate rule to be applied between states or that the authorities which they cite are applicable to controversies between states, where the individual citizen and his property becomes merged into and disappears from view within the greater rights of the sovereign, the state, including not alone him and his private property interests, but as well all the people and all the property and natural re-

sources (private and public), within the boundaries of the commonwealth; and concerning not so much the past and the present, as the future of the state and its people; beside which greater rights the citizen and his limited usufructuary property sink into insignificance. And we contend that rules which, for the present, might apply between one water user and his neighbor, or even him and his state, are wholly inadequate to procure for his state and a neighboring state, a just settlement and adjustment of the rights of each to the enjoyment unimpaired of their natural resources not alone for the present but as well for all future time.

We respectfully contend that the rule of priority of appropriation (a mere rule of private usufructuary right) cannot apply in the settlement of controversies between sovereign states over the waters of rivers common to both.

States have rights irrespective of and greater than the usufructuary rights of private owners, in their natural resources of which, all agree, water is one of the most and, in the arid states, the most valuable. A controversy of this nature rises therefore above a controversy between private property owners in neighboring states and must be treated upon those broader principles which apply between nations regardless, in large measure, of the private property rights of the citizens of either. As well sail by this court in the opinion by Mr. Justice Holmes in *Georgia vs. Tennessee Copper Co.*, notwithstanding vigorous dissent:

> "The case has been argued largely as if it were one between two private parties; but it is not. The very elements that would be relied upon in a suit between fellow-citi-

zens as a ground for equitable relief are wanting here. The state owns very little of the territory alleged to be affected, and the damage to it capable of estimate in money, possibly at least, is small. This is a suit by a state for an injury to it in its capacity of quasi-sovereign. In that capacity the state has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain. It has the last word as to whether its mountains shall be stripped of their forests and its inhabitants shall breathe pure air. It might have to pay individuals before it could utter that word, but with it remains the final power. The alleged damage to the state as a private owner is merely a makeweight, and we may lay on one side the dispute as to whether the destruction of forests has led to the gullying of its roads. * * *

Some peculiarities necessarily mark a suit of this kind. If the state has a case at all, it is somewhat more certainly entitled to specific relief than a private party might be. It is not lightly to be required to give up quisi-sovereign rights for pay; and, apart from the difficulty of valuing such rights in money, if that be its choice it may insist that an infraction of them shall be stopped.

The states, by entering the Union, did not sink to the position of private owners, subject to one system of private law. This court has not quite the same freedom to balance the harm that will be done by an injunction against that of which the plaintiff

complains, that it would have in deciding between two subjects of a single political power. * * *

It is a fair and reasonable demand on the part of a sovereign that the air over its territory should not be polluted on a great scale by sulphurous acid gas, that the forests on its mountains, be they better or worse, and whatever domestic destruction they have suffered, should not be further destroyed or threatened by the act of persons beyond its control, that the crops and orchards on its hills should not be endangered from the same source. If any such demand is to be enforced this must be notwithstanding the hesitation that we might feel if the suit were between private parties, and the doubt whether, for the injuries which they might be suffering to their property, they should not be left to an action at law.* * *

Whether Georgia, by insisting upon this claim, is doing more harm than good to her own citizens, is for her to determine. The possible disaster to those outside the state must be accepted as a consequence of her standing upon her extreme rights."

Georgia vs. Tennessee Copper Co., 206 U. S. 230, 237.

This is a case even stronger than the foregoing. Here not only is one state (Wyoming), "Standing upon her extreme rights," but Colorado likewise asserts "it is the right of the defendant commonwealth to dispose of the waters of that portion of said stream" (the Laramie River), "lying within

the State of Colorado, without let or hinderance by the complainant or its citizens; and defendant avers that the *defendant commonwealth can so dispose of the waters of said stream regardless of the prejudice that it may work to the complainant or its citizens within the State of Wyoming, and need give no reason for its will.*"

Answer of State of Colo. Par. 1, Vol. 1, p. 31 of Record.

As well observed by Mr. Justice Brewer in *Kansas vs. Colorado,* where, as here, there were several defendant Colorado corporations:

> "While several of the defendant corporations have answered, it is unnecessary to specially consider their defenses, for, if the action against Colorado fails, it fails also as against them."
>
> Kansas vs. Colorado, 206 U. S. 46, 85.

Here the rights of the private citizens (or local corporations) of the plaintiff state on the one hand or those of citizens of Colorado on the other hand, sink into comparative insignificance and are included within the greater right of the states, and likewise, rules of local law in either Wyoming or Colorado, whereby the relative rights of the citizens of either (priority of appropriation with differing methods of acquisition, administration and enforcement) are determined, degulated and protected, have no place in determining the rights of the states for "the state has an interest independent of and behind the title of its its citizens, in *all* the earth and air within its damain" (Georgia vs. Tennessee Copper Co., *supra*).

In *Kansas vs. Colorado,* Mr. Justice Brewer further points out the essential difference between the private property rights of the citizen (in that case riparian rights), and the greater rights of the state in the following language:

> "It is the State of Kansas which involves the action of this court, charging that through the action of Colorado a large portion of its territory is threatened with disaster. In this respect it is in no manner evading the provisions of the Eleventh Amendment to the Federal Constitution. *It is not acting directly and solely for the benefit of any individual citizen to protect his riparian rights. Beyond its property rights it has an interest as a state in this large tract of land bordering on the Arkansas River.* Its prosperity affects the general welfare of the state. *The controversy rises, therfore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint.*" (Georgia vs. Tennessee Copper Co. 206 U. S. 230).
>
> Kansas vs. Colorado, 206 U. S. 46, 99.

We have previously observed that riparian rights (likewise rights by appropriation), are but private property rights of individuals within the greater right of the sovereign—the state. We further observed that Colorado, by her constitution and the decisions of her courts and statutes, had always stood upon her extreme rights to the fullest degree and had denied the right of the use of her waters to citizens of other states under rules of appropriation or otherwise (S. L. 1917, p. 539; Stockman vs. Leddy, 55 Colo. 24, 28).

New Jersey took the same position in 1905 (P. L. 1905, p. 461; 70 N. J. Eq. 698), and denied the right of her citizens or others to withdraw the waters from her domain, under theory of private property therein by riparian rights or otherwise. Her assertion of her full power was questioned by those who assumed to act under authority of contracts with riparian owners, some of which were executed before and some after the enactment of the prohibitory statute (see 70 N. J. Eq. 526), but her right to preserve her natural resources, irrespective of the assent or dissent of the private rights of her citizens was upheld by her courts (70 N. J. Eq. 525; Id. 695). Her action and decree having been brought before this court for review, her action was upheld and in the opinion by Mr. Justice Holmes it is said:

> "The courts below assumed or decided and we shall assume that the defendant represents the rights of a riparian proprietor, and on the other hand, that it represents no special chartered powers that give it greater rights than those. * * * But we prefer to put the authority which cannot be denied to the state upon a broader ground than that which was emphasized below, since in our opinion it is independent of the more or less attenuated residuum of title that the state may be said to possess.
>
> All rights tend to declare themselves absolute to their logical extreme. Yet all in fact are limited by the neighborhood of principles of policy which are other than those on which the particular right is founded, and which become strong enough to hold their own when a certain point is reached.

The limits set to property by other public interests present themselves as a branch of what is called the police power of the state. The boundary at which the conflicting interests balance cannot be determined by any general formula in advance, but points in the line, or helping to establish it, are fixed by decisions that this or that concrete case falls on the nearer or farther side. * * *

It sometimes is difficult to fix boundary stones between the private right of property and the police power when, as in the case at bar, we know of few decisions that are very much in point. But it is recognized that the state as quaisi-sovereign and representative of the interests of the public has a standing in court to protect the atmosphere, the water and the forests within its territory, irrespective of the assent or dissent of the private owners of the land most immediately concerned. *Kansas vs. Colorado*, 185 U. S. 125, 141, 142; S. C., 206 U. S. 46, 99; *Georgia vs. Tennessee Copper Co.*, 206 U. S. 230, 238. What it may protect by suit in this court from interference in the name of property outside of the state's jurisdiction, one would think that it could protect by statute from interference in the same name within. On this principle of public interest and the police power, and not merely as the inheritor of a royal prerogative, the state may make laws for the preservation of game, which seems a stronger case. (*Geer vs. Connecticut*, 161 U. S. 519, 534).

* * * But we agree with the New Jersey courts, and think it quite beyond any rational view of riparian rights that an agreement, of no matter what private owners, could sanction the diversion of an important stream outside the boundaries of the state in which it flows. The private right to appropriate is subject not only to the rights of lower owners, but to the initial limitation that it may not substantially diminish one of the great foundations of public welfare and health.

We are of opinion, further, that the constitutional power of the state to insist that its natural advantages shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and there are benefits from a great river that might escape a lawyer's view. But the state is not required to submit even to an aesthetic analysis. Any analysis may be inadequate. *It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will.*"

Hudson Water Co. vs. McCarter, 209 U. S. 349, 354-7.

While, as observed in a previous portion of this brief, Mr. Justice Holmes premised his remarks with "The problems of irrigation have no place here" (p. 356), nevertheless the sovereign jurisdiction of New Jersey over the waters within her borders would appear to be no greater and no less than that

of any other state of the Union admitted on an equality "in all respects whatever," and the rights there affected (riparian rights), were after all mere usufructuary titles of the same and no greater or less dignity than are the usufructuary rights of the prior appropriator (See previous discussion this brief, pages 175 to 214.)

Kinney on Irrigation and Water Rights (2nd Ed), p. 2225.

Walbridge vs. Robinson, 22 Idaho, 240.

Biennial Rep. Atty. Genl. Wyo. (1915-16), p. 75.

That private property rights of individuals in waters of interstate streams (by appropriation or common law) cannot determine the rights of the states in controversies one with another is clearly discussed by Mr. Justice Holmes in *Richey Land & Cattle Co. vs. Miller & Lux*, involving private rights of water users in Nevada (where the appropriation doctrine obtains) and users in California (where both the common law of riparian rights and rights by appropriation are recognized). He there likened the usufructuary rights of water users to parcels of land:

> "When a right is asserted in favor of land in one jurisdiction over land in another, different principles are involved from those that suffice when both parcels are subject to the same law. When such rights have been recognized it has been on the ground of an assumed 'concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted. *Manville Co. vs. Worcester*, 138 Massachusetts, 89.' *Missouri vs. Illi-*

nois, 200 U. S. 496, 521. But still there are two parcels of land subject to different systems of law; and although the rights and liabilities in respect of each may require a consideration of the other if they are to be dealt with completely, the fact remains that each may be regulated by the state where the land lies according to its sovereign will. *Kansas vs. Colorado*, 206 U. S. 46, 93. If then the courts of one state are about to deal with one parcel they should not be indirectly interfered with by a foreign court that has no power to control the use of the *res*. It is said to be a general principle that apart from some privity, such as is created by contract, trust, or fraud, courts of equity recognize the impropriety of using their power over the person to achieve such a result. *Northern Indiana R. R. Co. vs. Michigan Central R. R. Co.*, 15 How. 233, 242-244; *Carpenter vs. Strange*, 141 U. S. 87; *Norris vs. Chambers*, 29 Beav. 246, 253, 254; S. C., 3 De G., F. & J., 583, 584. It is conceivable, to be sure, that the decisions of this court may determine that the states have rights as against each other *in invitum* in streams that flow through the land of both. *Kansas vs. Colorado*, 206 U. S. 46, 84; *Missouri vs. Illinois*, 200 U. S. 496, 519, 520. These rights may vary according to the system of law required by natural conditions. * * * But whatever this court may decide, *if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state, and*

those rights, the petitioner insists, can, or at least should, be determined only in a suit *brought by the state itself.*"

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 260, 261.

The above decision was announced Nov. 7, 1910. Evidently having in mind, *inter alia*, this decision and the rule there discussed of "concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted," and that the relation of the right within the two jurisdictions "depends as well upon the permission of the laws of Nevada as upon the compulsion of the laws of California" and "the acts necessary to enforce it must be done in California and require the assent of that state" etc., and further the language "if California recognizes *private rights* that cross the border line"—the California legislature in the next session, and immediately following this decision, passed an act almost identical in its terms with the New Jersey act construed by this court in Hudson Water Co. vs. McCarter, *supra*, absolutely prohibiting the diversion of its waters for use in other states, denying the recognition of rights that cross the border line of the states and negativing the presumption of one state offering and the other accepting the right.

L. Cal. 1911, Chap. 104, p. 271 (Approved March 3, 1911).

That rights of appropriators are but private rights and cannot prevail in a suit such as this (between states) is further recognized by this court in *Bean vs. Morris*, wherein Mr. Justice Holmes said:

"We pass at once to the question of private water rights as between users in different states.

We know no reason to doubt, and we assume, that, subject to such rights as the lower state might be decided by this court to have, and to vested private rights, if any, protected by the Constitution, the State of Montana has full legislative power over Sage Creek while it flows within that state. Kansas vs. Colorado, 206 U. S. 46, 93-95. Therefore, subject to the same qualifications, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521; Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 260. But with regard to such rights as came into question in the older states, we believe that it always was assumed, in the absence of legislation to the contrary, that the states were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state that could be acquired from within."

Manville Co. vs. Worcester, 13 Mass. 89, and several other cases are then cited and after observing that the doctrine of appropriation prevailed in both Montana and Wyoming before either were admitted to the Union and that the presumption is that the same system still pervailed, "save as necessarily implied or expressed" he closes the discussion of private rights of individuals in different states, as follows:

"It follows from what we have said that it is unnecessary to consider what limits there may be to the powers of an upper state, if it should seek to do all that it could. The grounds upon which such limits would stand are referred to in Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 261. So it is unnecessary to consider whether Morris is not protected by the Constitution; for it seems superfluous to fall back upon the citadel until some attack drives him to that retreat."

Bean vs. Morris, 221 U. S. 485, 486, 488.

We pause to observe, that in this case (one between states and not private property owners) each state seeks "to do all that it could." One state asserts its full claims, these the other denies and in turn sets up full claim and says "it need give no reason for its will." It accordingly appears that any advantage to be gained by Wyoming from the language of this decision is swept aside by the character of this suit, where the rights must be determined under rules above announced as prevailing between states, not individuals.

And here again we note that Colorado since admission to the Union, by her constitution, the decisions of her courts and her statutes has steadfastly refused to recognize any rights, of individuals or states, without her borders.

Colo. Const. Art. XVI, Sec. 5.
Lamson vs. Vailes, 27 Colo. 201.
Stockman vs. Leddy, 55 Colo. 24.
S. L. Colo. 1917, Chap. 151, p. 539.
Kansas vs. Colo. 206 U. S. 46.

In the foregoing decision this court observes:

"So it is unnecessary to consider whether Morris is not protected by the Constitution" (p. 488) referring, as we are advised, to the claim that this right had vested before admission of Montana to the Union with full sovereign powers of a state. We wish to note that in the pending case Wyoming does not and canot make any such claim by reason of the fact that according to her evidence, with exception of one small appropriation, *no use whatever* had been made of the waters of the Laramie River *prior to the admission of Colorado to the Union, Aug. 1, 1876.* Substantially all of the Wyoming development has occurred subsequent to that date, and a large part subsequent to the Coloardo project here complained of. (See Def. Orig. Brief, Vol. II, p. 228).

Decree Dist. Ct. Laramie Co., Pl. Ex. N; also, Supp. Brief of Wyoming, p. 24.

It is therefore unnecessary to consider what difference, if any, would exist if Wyoming could claim constitutional protection of rights which had vested before Aug. 1, 1876, and the field is cleared of any claim of private rights under the Constitution and simplified to an issue of rights between sovereign states.

Even were we to assume, for argument's sake, that Colorado had not (since 1876) expressly denied recognition of all extra-territorial claims upon the streams rising and flowing within her borders, the fact still remains that there is no concurrence of laws upon which to base a claim of presumption of interstate servitudes between individual citizens of the two states, for, while both Wyoming and Colorado have fundamentally adopted the doctrine of ap-

propriation for determination of private usufructuary rights *within their respective borders,* yet even by constitutional provisions, as well as by statutes and court decisions, there is irreconcilable conflict, both in the preference of uses one over another, the extent to which a right attaches at all, the limit or lack of limit of the use within any one class, the means and method of initiating the right as well as the subsequent fixing and determination of the same, to omit from discussion the many conflicting rules and methods of distribution. The most that can be said is that both assert full state ownership and control over the waters within their borders and abolish riparian rights as a rule or basis of usufructuary private rights. Beyond this point the systems diverge. But we need not further consider this topic for no concurrence of laws is recognized by either state, even as to private property rights. (See *supra,* pages 149 to 175.)

We shall treat further of this subject in the pages to follow but for the moment shall consider the authorities cited by counsel for Wyoming dealing with this phase of the question.

(a) Plaintiff's Authorities—Not in Point.

Plaintiff in its supplemental brief, pp. 153-156, cites a number of authorities upon the "Effect of state lines upon right of Appropriators," and state: "The question of the effect of state lines upon the rights of appropriators in different states has been before the courts of the arid region in a number of states and so far as we have been able to find has always been decided in the same way. The universal holding is that priority of appropriation gives priority of right on interstate streams the same as on

streams wholly within one state." (Pltff. Supp. Brief p. 153).

The statement of plaintiff's position reveals its fundamental weakness. This action is one *between the sovereign states* of Wyoming and Colorado, each asserting its fullest sovereign claims to the waters of the Laramie river, and *not between mere individual citizens* of the respective states who claim appropriations under the laws of their states. Here we cannot presume a recognition of interstate servitudes because they are expressly denied by both states.

Plaintiff cites the cases of *Hoge vs. Eaton,* 135 Fed. 411, 414; *Taylor vs. Hulett,* 15 Ida. 265; *Conant vs. Deep Creek & Co.,* 23 Utah, 627; *Willey v. Decker,* 11 Wyo. 496, 533; *Howell vs. Johnson,* 89 Fed. 556; *Anderson vs. Bassman,* 140 Fed. 14; *Morris vs. Bean,* 123 Fed. 618; Id. 146 Fed. 423; *Bean vs. Morris,* 159 Fed. 651, 655; *Rickey Land & Cattle Co. vs. Miller & Lux,* 152 Fed. 11, 17; Id. 218 U. S. 258; *Bean vs. Morris,* 221 U. S. 485; and 3 Kinney on Irrigation (2nd Ed.) p. 2216 and relies upon these cases as authority for the statement above quoted and evidently intends that they shall be considered as authority for the rule that priority irrespective of state lines shall control sovereign states, and as determining the rights of the states in their sovereign capacity to the jurisdiction of the waters within their borders.

None of these cases are in point in this suit. Whatever the rights of the individual appropriators within each of the states may be, undoubtedly the states themselves have certain sovereign rights and powers irrespective of the private property rights of the citizens of either and in this suit, which is brought by Wyoming in her sovereign capacity against Colorado in its sovereign capacity, it is apparent that decisions dealing with the private prop-

erty rights of the citizens of each of the respective states can have no bearing in the settlement of this controversy which involves the greater rights of the states themselves. Whatever rights the citizens may possess are undoubtedly included within the greater right of the state and must stand or fall, not upon the private property right, but upon the greater right of the state.

Georgia vs. Tennessee Copper Co., 209 U. S. 230, 237;
Kansas v. Colorado, 206 U. S. 46, 99;
Hudson Water Co. v. McCarter, 209 U. S. 349, 356.

Brief comment upon these cases cited by counsel is sufficient.

Hoge v. Eaton, (135 Fed. 411) involved a controversy between two private appropriators from Sand Creek, an interstate stream of Colorado and Wyoming. Neither of the states were parties to the suit. Whatever language Judge Hallett used therein is therefore at best a *dictum.* The case was decided before the decision in Kansas v. Colorado, *supra,* which overrules the language quoted in plaintiff's brief. In *Kansas vs. Colorado,* the government of the United States cited the case of *Hoge vs. Eaton,* and quoted the language here quoted by plaintiff in their brief, in support of the contention that Colorado does not exercise soverign jurisdiction over the waters within its borders (Brief of U. S. on Final Hearing, page 191-3). It was in reply to the government's contention for national control of streams under the rule of prior appropriation irrespective of state lines that this Court, by Mr. Justice Brewer, made answer:

> "But it is useless to pursue this inquiry further in this direction. It is enough for the purposes of this case that each state has full jurisdiction over the lands within its borders, including the beds of streams and their waters * * * It may determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriation of waters for purposes of irrigation shall control."
>
> Kansas v. Colorado, 206 U. S. 46, 93-4.

Taylor vs. Hulett, (15 Ida. 265); *Conant vs. Deep Creek & Co.* (23 Utah 627); and *Willey vs. Decker*, (11 Wyo. 496); were decisions of state Courts involving the determination of appropriations in one state for use in another where the court had jurisdiction of both the person and property and where neither state had then denied interstate servitudes. The Idaho and Utah cases proceeded upon the theory of comity between states as defined in Carpenter v. Strange, 141 U. S. 105. The Idaho Court pointed out however that it must act upon the person and not the property which might be situated in a different jurisdiction. In neither of these cases were the rights of the state in any way involved.

In the case of *Willey vs. Decker* (*supra*) it is specifically pointed out that the rights of individuals there in question had vested before either state was admitted to the Union and the Court was careful to say "We are not called upon in the case at bar to decide whether such an apropriation as the plaintiff's * * * rely on can be lawfully made in this state under our constitution and present statutes; and we shall express no opinion on that matter", and the

doctrines were applied upon the particular facts of the case:

> "In the absence of contrary constitutional or statutory provisions".
>
> Willey v. Decker, 11 Wyo. 496, 511, 531.

We have already noted that the Wyoming Court in a recent case has practically reversed its decision in *Willey vs. Decker,* by denying, even where it had jurisdiction of both the property and the person, the right of eminent domain for construction of a ditch to head in Wyoming and irrigate lands in Colorado, thereby preventing the diversion in Wyoming for use in Colorado, upon a stream common to both.

> Grover Irr. Co. v. Lovella Ditch Co., 21 Wyo. 204, 240, 256;
>
> See also Biennial Rep. Atty. Gen'l., Wyoming (1915-16), p. 75.

The cases of *Howell vs. Johnson* (89 Fed. 556.) and *Anderson vs. Bassman,* (140 Fed. 14) were *between private parties* and the *states* wherein the various appropriations obtained under local law *were in no manner involved.* Both these cases were cited and urged as authority for the doctrine of priority irrespective of state lines by the United States in its brief in the case of *Kansas vs. Colorado* (Brief of U. S. on Final Hearing, 153, 178, 191) and the ruling of this Court, above quoted, was the answer to the contention here made.

It is interesting to note however, that in *Anderson vs. Bassman* the waters were not apportioned on the rule of appropriation irrespective of state laws:

> "The right of each is to have a reasonable apportionment of the water of the stream during the season of the year when

> it is scarce * * * the only method that appears to provide a just and equitable division is some fair and appropriate division in time by which the complainants and defendants shall have the use of the water alternately during the dry season."
>
> Anderson v. Bassman, 140 Fed. 14, 29.

Morris vs. Bean, (123 Fed. 618); Id. (146 Fed. 423); and *Bean vs. Morris* (159 Fed. 651) have been considered by this Court in *Bean vs. Morris,* 221 U. S. 485, wherein Mr. Justice Holmes said:

> "We know no reason to doubt, and we assume, that, subject to such rights as the lower state may be decided by this Court to have and to vested private rights, if any, protected by the constitution, the state of Montana has full legislative power over Sage Creek while it flows within that state."
>
> Bean v. Morris, 221 U. S. 485, 486.

In the above cases the private property rights of individuals were alone involved and in neither thereof were the states made parties. There was no showing of express denial by Constitution, laws or Court decisions (as is here the case) of refusal to recognize extra-territorial rights.

Rickey Land & Cattle Co. vs. Miller & Lux (152 Fed. 11) was reviewed by this Court in 218 U. S. 258. In as much as counsel quotes the language of this Court pointing out that in such a suit as was there presented, the rights of the state, as such, were not involved, and what such rights would be if properly asserted, we shall make no further quotation, and the same might have been said of the decision in the case of *Bean vs. Morris,* 221 U. S. 485, quoted on Page 162-3 of the brief of counsel.

Counsel also cites *Farm Investment Co. vs. Carpenter,* (9 Wyo. 110) but we are unable to concur with the conclusion that the decision in that case is authority for their contention. On the contrary that decision is authority against plaintiff:

> "we entertain no doubt of the power of the people in their organic law, when existing vested rights are not unconstitutionally interferred with, to declare the waters of all natural streams, and other natural bodies of water, to be the property of the public, or of the state. Nor do we doubt that the legislature may make a like declaration, when, in that particular, unrestrained by the constitution.
>
> If any consent of the general government was primarily requisite to the inception of the rule of prior appropriation, that consent is to be found in several enactments by Congress.
>
> The title of the appropriator fastens, not upon the water while flowing along its natural channel, but to the use of a limited amount thereof for beneficial purposes, in pursuance of an appropriation lawfully made and continued. The appropriation is made, in the first place, upon the basis of public ownership of the water, and is protected instead of impaired by the constitutional declaration."
>
> Farm Investment Co. v. Carpenter, 9 Wyo. 110, 137, 139.

The citation from Kinney on Irrigation, Vol. 3, Sec. 1225, is of little avail for the reason that it is but a summary of the law announced in the decisions

cited by counsel,—all of which, as already noted, do not relate to the rights of the states themselves. A reference to the author's foot note, however, calls attention to two cases holding contrary to the language quoted.

In *Lamson v. Vailes*, Chief Justice Campbell announced a doctrine in direct contrast to that announced in the cases cited by counsel for plaintiff. He denied to New Mexico the benefit of the laws of Colorado relative to adjudication of priorities. He said, in part:

> "We cannot presume that the general assembly intended to enact a law to operate beyond the territorial limits of the state. The distinction sought to be made by appellants, that the point of diversion of the ditch is the sole factor determining the jurisdiction of the Court, is not good. * * * It is not to be supposed that the state was legislating for the reclamation, or irrigation, of lands beyond its boundaries, or making provisions by the way of police regulations (which we have held these statutes, in some measure, to be) over a territory beyond its jurisdiction."
>
> Lamson v. Vailes, 27 Colo. 201, 203.

In *Turley v. Furnam*, (N. M.) Justice McFie adopted the doctrine announced by Chief Justice Campbell in *Lamson v. Vailes*, holding that New Mexico had no jurisdiction to determine the rights of an appropriator whose diversion occurred in Colorado for irrigation of lands in New Mexico.

> Turley v. Furnam, 16 N. M. 253, 262.

(b) Conclusion.

Stripped to the fundamental, it is the natural resource, the river and its waters, which we must here consider, irrespective of such usufructuary rights as the state may from time to time permit to its citizens. When the state entered the union, the river and its waters were a part of the domain set apart for its future growth and development. The few years that have since elapsed are but an instant as compared with the perpetuity of the commonwealth. The state now requires the use of its natural resources and it is to be presumed that the need will increase in the future and must be satisfied in so far as geographical conditions and physical obstacles shall permit. The waters of its streams are the most valued resources of the state. To them even more than to its lands, it must look for its future development, prosperity and general welfare. Any rights to the use of the waters which the state may have granted its citizens in the past, or may in the future permit them to acquire, are at best but temporary. Whatever rules it may have announced for the regulation, control and limitation of these rights are but of present not future importance. The possessory right in the stream had its origin in use and the right terminates whenever the individual ceases to make the use. The usufructuary right of the citizen is ever subject to the uncertainties and vicissitudes of human affairs while the title of the state is the same in the end as it was when it was admitted to the union. Whatever usufructuary rights the state may have permitted in its waters may be by it resumed, by exercise of its sovereign power of eminent domain, whenever it may so decree and it may resume to itself its first and former estate for disposal

and use according to its sovereign will and in such manner as shall best be adapted to its growing necessities, irrespective of the wishes or claims of the individual appropriator. Whatever right the state may now grant to the citizen it may at any time take away but the natural resource it may keep and "give no one a reason for its will." The individual and his usufructuary rights may vest today only to be abandoned or condemned tomorrow to give way to other uses demanded by new necessities. For while individuals may come and go the state and its jurisdiction are as enduring as the stream itself and to paraphrase the thought of the poet:—"Men may come and men may go, but the state goes on forever."

> "But the words of the Constitution would be a narrow ground upon which to construct and apply to the relation between states the same system of municipal law in all its details that would be applied by the individuals".
>
> Missouri v. Illinois, 206 U. S. 496, 520.

It would thus appear that laws of the usufruct in waters of the stream, by the individual in his relations to other users or his state, under whatever doctrine recognized (riparian or appropriation) have no place in the interpretation of laws which determine the rights of the state to not only use but keep its natural resource, the waters of its streams. The temporary claims of the individual do not rise above those of his state, and, it would appear, should not control the destiny of his commonwealth in its relation with other states.

(2) APPROPRIATION DOCTRINE VIOLATES EQUAL RIGHTS OF STATES.

In our previous discussion of the doctrine of priority of appropriations we observed that, like the rule of riparian rights, it is exclusive in its character, and the appropriator, if his needs so require, may take the entire flow of the stream.

(See pp. 190 to 214.)

In this conclusion counsel for Wyoming concur.

Sup. Brief of Plaintiff, pp. 134-140.

We observed that, under the doctrine of riparian rights, while the usufructuary rights of the riparian owners were in all respects equal, i. e., that each had an equal right to use the waters of the stream touched by his lands, nevertheless, as regards the property of all the citizens of the state, the doctrine is exclusive in that it grants to one class the sole use of the waters of the stream, by reason of accident of physical location of the riparian or bank lands, to the utter exclusion and denial of benefits to all other lands (nonriparian). In fact, a more wasteful monopoly in waters could hardly be conceived than that granted this favored class, who are thus privileged to utterly deny the greater body of the lands of the state all use of the waters of the stream while the favored few, whose lands happen to touch the stream, use the same as it flows along to finally waste into the sea. Hence, while the rights of riparian owners are equal one with another in their common use of the stream, they are, as a class, unequal and exclusive as regards the remainder of the lands of the state.

So, too, are private usufructuary rights by ap-

propriation exclusive and unequal. The first appropriator may take the waters of the stream to the extent of his necesary uses, with the qualifications that he must not enlarge his demands on the stream after the rights of juniors have attached, who are entitled to have the conditions remain as they were when they went upon the stream (Vogel v. Minnesota Canal Co. 47 Colo. 534, 541). If his actual, established needs so require, the first appropriator may take the entire flow of the stream to the exclusion of all juniors as well as all riparian and non-riparian owners. But the rule, though most exclusive, has the saving feature that no water goes wasting to the sea, and, as the rights of the first appropriator are limited fundamentally to beneficial use, none may be needlessly wasted, for if he has no actual need for the water he has no right to divert it and it must pass to juniors requiring its use.

While these characteristics of the two doctrines for acquisition and regulation of private usufructuary rights, are the established rules, with local modifications, in the various states of the union, it is apparent that either of them is fundamentally inapplicable to the regulation of rights between states, each of which stands upon an equality with each of the others "in all respects whatever", to the same degree as independent nations are to be regarded as equal in dignity and sovereign power.

Each state depends for its existence primarily upon its natural resources and that too irrespective of the rights or property interests of its citizens.

Missouri v. Illinois, 180 U. S. 208, Id. 200 U. S. 258.
Kansas v. Colorado, 206 U. S. 46.
Georgia v. Tennessee Copper Co., 206 U. S. 230.
Hudson County Water Co. v. McCarter 209 U. S. 341.

Water is one of the great natural resources of every state and in the arid states is frequently the most valuable. Upon the water, the state and her people must depend for all time for life, health and prosperity, and, if deprived of this natural resource, must ultimately perish. Self defense compels the state to withhold its resources for the benefit of future as well as present generations and for the welfare and perpetuity of the state.

> "It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will".
>
> Hudson County Water Co. v. McCarter (*supra*).

With independent nations, these natural resources, if need require, must be defended by the sword. But with states of the union this Court must determine the controversy.

> Kansas v. Colorado, 185 U. S. 125; 206 U. S. 46.
> Missouri v. Illinois, 180 U. S. 208; 200 U. S. 258.

Turning now to an application of either of these rules of private local law to settlement of state con-

troversies over interstate streams we find that either exclusive rule cannot apply, and in particular is this true of the doctrine of appropriation, the more exclusive.

(a) Laramie River—Illustration

By way of illustration we shall first apply the rules to the river here involved:

The Laramie river rises in part in Colorado and in part in Wyoming. The branch in Colorado rises in high mountains and flows down through a narrow valley into Wyoming. Soon after reaching that state it enters a wide plains area, the Laramie Plains. The riparian or "bank" lands in Colorado are limited to the narrow mountain valley, while in Wyoming they extend from the river for miles upon either side. Out on the eastern plains of Colorado however are great areas of arid but fertile lands needing but the benefit of her mountain waters to bring them into the same high state of productivity already attained upon adjacent irrigated areas.

If the rule of riparian rights were to control the settlement of this controversy, Colorado would be forever deprived of but the most insignificant use of her own waters, her greatest natural resource, and her fertile but arid lands would remain forever unproductive, by reason of the fact that only the lands of the narrow mountain valleys in Colorado are riparian, and these waters, imperative to her present and future development and welfare, would pass forever into Wyoming there to be used, enjoyed or wasted or to pass to the sea. The exclusive rule, forbidding use on non-riparian lands, for the benefit of the favored class (riparian lands), would prevent the use by Colorado of her most valuable resource while at the same time would give it to her neighbor upon

which to fatten at the expense of the former. If such were the situation between independent nations, Colorado would seize such portion of water as she could and, if forced to that extreme, would defend her right so to do by the sword. Further argument would seem unnecessary to demonstrate that the riparian doctrine of private (and equal yet exclusive) usufructuary rights cannot apply between states or nations however ancient its origin may be.

With equal force, the doctrine of prior appropriation cannot apply between these states, with equal rights and powers to enjoy and control their own natural resources throughout all future time.

While in this case the forces of nature have so shaped the Laramie river valley that, do what she may, Colorado can never take more than a 91-250 portion of the water rising within her own borders and must permit the remainder, for all time, to pass to her neighbor, Wyoming, to use, waste or pass to the sea; yet, for the purpose of this illustration, we shall assume that the physical conditions were such that both the waters of the Colorado Laramie and those rising in Wyoming could be diverted within the latter state at the mouth of the Little Laramie and carried thence into Colorado. Further, that long prior to any development in Wyoming, this interstate canal had been constructed and all the waters so diverted in Wyoming, but rising in both states, had been conveyed into Colorado and there used upon her lands. Under the rule of priority of appropriation such right would have been exclusive and Colorado could forever prevent Wyoming from the use not only of the Colorado waters but as well of the waters rising and flowing in Wyoming (her valuable natural resource) and thereby Wyoming would be doomed, as to this

river, to total aridity while Colorado would wax rich at the expense of her neighbor. We venture to say that, were the states independent nations, the exclusive claim of the first appropriator in such a case would be refused recognition in any court for the settlement of international controversies and that Colorado would be limited to the use of her own waters and forbidden those of Wyoming. Colorado could not thus impose an extra-territorial servitude upon Wyoming without her consent, and the right of Wyoming to deny any such claims, had not surrender been made in the Constitution, might well be enforced by her armies in defense of herself and her natural resource.

The exclusive rule of appropriation is open to other similar objections.

(b) Destiny of State Left to Accident.

Location and construction of canals and diversion works are frequently the result of natural conditions. Such works are usually first constructed where no natural obstacles interfere.

On the other hand it requires the accumulated force of years and the massing of wealth, sometimes of generations, to overcome the great natural barriers which frequently obstruct the progress of development but whose ultimate removal is imperative in order that the desert places may be converted into fields and gardens, and the people of the state and the nation may obtain sustenance.

Infant nations or states can little afford to undertake projects which, in their later history, their accumulated energies often accomplish with apparent ease. For example, the United States could little

have undertaken and much less have accomplished, the construction of great irrigation works in the early years of our history. So, too, in the instant case, while natural conditions offered no obstacle and, on the contrary, invited construction on the plains of Wyoming, and canals were there built with ease and little expense, yet it took the accumulated energy of nearly half a century for Colorado to accumulate sufficient vital force to drive the tunnel through the mountain range wherewith to make beneficial use of the smaller part of the waters of her own stream.

Thus, it is that prior appropriation is very frequently the accident of physical location, and were the rule to apply between states their destiny would be determined, not by their present or future necessities for use of their natural resources, but rather by accident of local physical conditions inviting construction on the one hand or delaying it upon the other, thereby to leave the fate of states to accidental ease of first construction. While to be sure, the same rule applies with individuals in their usufructuary rights and within the state and the junior is utterly denied for benefit of the first taker, nevertheless such a preference is within the governmental powers of the states, and, in the disposition of their resources to the most ultimate good, inasmuch as there is but water for the few (which, if parceled among the many would benefit no one), the state may determine to whom the exclusive use may be given in order to ultimately bring to the state and its people the greatest benefit with the least waste, and furthermore, the state, whenever it may so desire, by the power of eminent domain, may take away all vested usufructuary rights and establish some new plan adapted to future conditions, only perhaps in the future to again condemn and establish still a different order of things.

But although such may be the local regulation among the private rights of citizens within the state, the very statement of the rule is its own denial, when asserted as law between states with equal rights and powers and which, save for the powers surrendered in the Constitution, are for all purposes of this case, to be considered as independent nations. To apply the exclusive rule of first appropriator would be to utterly deny to the one the use of its natural resources for total benefit of another.

The same objection may be pointed out in a different manner. In the case of Montana, as we read the record and briefs in *Bean v. Morris, supra*, it appears that Sage Creek, rising in that state and flowing into Wyoming, had its source in a portion of Montana set apart and withheld from development by the United States as an Indian Reservation during all the years when lands of Wyoming, along that stream, were open to settlement and reclamation. The reservation was later thrown open and Montana citizens were given their first opportunity to use either the lands or waters within their borders while, in the meantime, the waters of the Montana stream had been used in Wyoming by settlers who took with full knowledge that the stream had its rise in Montana and that the lands of that state are just as arid as those in Wyoming. If in that case the controversy had been between states, when Montana had her first opportunity to develop her domain and make use of her own, she would have been confronted by prior claims of citizens of Wyoming and, assuming that such claims were for the entire flow of the stream, her right to use her own resources would have been challenged by the neighboring state under claim of exclusive right by priority of appropriation.

To ask whether Montana, as a state, could thus be denied the use of her own greatest natural resource against her will, would seem its own denial. Yet such undoubtedly would be the effect of application of the private exclusive property rule of prior appropriation to settlement of controversies involving not only the present prosperity but as well the future destinies of states. Montana (if an independent nation) would without doubt, under all rules of international law, be entitled to make use of her own waters within her own domain in such manner as her sovereign will might prescribe and her neighbor, failing to settle the controversy by treaty or arbitration, must either suffer the consequences or challenge the right, which the neighbor would then defend. Undoubtedly no harsh, exclusive rule of first taker by private citizens could thus control the destinies of nations or of states of the Union.

The same conditions would obtain wherever natural, legal or artificial obstacles (forest or Indian reservations, etc.) have prevented the upper state from earlier making full use of her own. And, in the instant case, if in fact Wyoming had (which she has not) already appropriated all the waters of the Laramie river before any interwatershed diversions were undertaken by Colorado (owing to the enormity of the physical obstacles presented), it would be a new rule of international or interstate law which, on claim of first taker by a citizen of a neighboring state, would utterly deny to the state of origin the use of even a portion of her own waters, imperative for her own prosperity and the growth and sustenance of her own people. This would be especially true in view of the fact that the water had been used by Wyoming citizens after Colorado had been admitted as a state of the Union, with all the reserved

powers of the original thirteen, and with full knowledge upon their part of the natural conditions prevailing within Colorado and the necessities of the state and her people. Again we suggest that, under the law of nations, Colorado might take her own and do with it as she would and defend her right so to do by force.

Kansas v. Colorado, 206 U. S. 46, 98.

(c) **Servitude—Extra-territorial.**

But we cannot agree that among nations or states with equal powers and sovereign rights, the one may claim, through her citizens by mere first use, a preferred and exclusive right to perpetually use for her benefit waters rising within and flowing from out the domain of her neighbor, thereby to deny forever to the nation or state of origin a part or all of the benefit of her own stream, be her necessities ever so great.

In the opening pages of this brief we made note of the dignity and powers of independent nations and the equality thereof one with the other, also their exclusive jurisdiction over and right to use and enjoy their natural resources in such manner and at such times as best suited their development and their necessities and that the rivers of a nation are classed as among the most valuable of its natural resources.

Vattel Law of Nations, (1872 Ed. Chitty) pp. 53, 148-9, 163-4, also pp. 120, 123, 125.

Schooner Exchange v. McFadden, 7 Cranch, 116, 136.

Rhode Island v. Massachusetts, 12 Pet. 657, 633.

Further, that the original states, before the union, were free and independent states or nations and that each state of the Union, new or old, is, save for the powers surrendered to the United States by the Constitution, to be here considered as a free and independent nation with all its original rights to the benefit of and jurisdiction over the streams within its domain, and that each of the states of the Union, new and old alike, stand upon an equality one with the other and the powers of one are no greater and no less than those of every other.

New York v. Miln, 11 Pet. 102, 139.
Chisholm v. Georgia, 2 Dall. 419, 435.
Texas v. White, 7 Wall. 700, 725.
Kansas v. Colorado, 206 U. S. 46.

Each state may make such laws, rules and regulations for the control of streams within its domain as its local necessities may require, and the United States, by its legislation and its courts, recognizes and enforces these local laws.

Martin v. Waddell, 16 Pet. 367, 409-10;
Hardin v. Jordan, 140 U. S. 371, 380-2, 382, 402;
Shively v. Bowlby, 152 U. S. 1;
United States v. Rio Grande Irr. Co., 174 U. S. 690, 702-6;
Bacon v. Walker, 204 U. S. 311, 315;
Kansas v. Colorado, 206 U. S. 46;
Snyder v. Colorado Gold Dr. Co., 181 Fed. 62;
United States v. Cress,——U. S.——, 37 Sup. Ct. Rep. 380.

One state may grant rights to its citizens in its natural resources and its waters, which it may deny to citizens of another state.

McCready v. Virginia, 94 U. S. 391;
Manchester v. Massachusetts, 139 U. S. 240;
Geer v. Connecticut, 161 U. S. 519.

and the rights between states are to be decided irrespective of the rights or claims of private citizens.

Georgia v. Tennessee Copper Co., 206 U. S. 230;
Kansas v. Colorado, 206, U. S. 46;
Hudson Co. Water Co. v. McCarter, 209 U. S. 349;
Richey Land & Cattle Co. v. Miller & Lux, 218 U. S. 258;
Bean vs. Morris, 221 U. S. 485.

To carry the reasoning to its conclusion, it would seem, therefore, that whenever any rule of private property law is suggested as a proper rule for settlement of interstate disputes, it cannot obtain for such purpose if it violates any of the fundamental principles above announced. We contend the private property rule of priority of appropriation cannot obtain as a rule of interstate law. Neither for that matter can the private property rule of riparian rights apply. Both are rules of exclusion, where the usufruct in the natural resource, the water, is taken from the many and given to the few, and in turn the few exclude the many from its enjoyment.

In disputes over rivers common to two states, any rule, which permits the lower state to deprive the state of origin of the use and benefit of the waters that rise and flow within her borders, would be contrary to the fundamental doctrine that each state, as with an independent nation, has the right to, and must of necessity, enjoy and rely upon her natural resources within her domain, and cannot be deprived

thereof by her neighbor without her consent, to her own destruction. Waters that rise and flow from one state into another are forever lost to the former unless there used, and any rule which forbids this use denies to the state or nation of origin the benefit of her inherent sovereign right to enjoy her own and maintain herself with her domain.

This, the rule of appropriation does. It takes, if need be, the whole of the stream and gives it to the first user as against all others.

Here Wyoming claims that she is entitled to all the waters of the Laramie river which rise and flow in Colorado because, she says (and in the proof whereof she failed), her citizens appropriated and used all the waters of this river prior to the time Colorado and her citizens, delayed as they were, by a theretofore insurmountable obstacle (mountain range), had gathered sufficient vital force to build her "skyline" ditches over the mountain passes and to drive her great tunnel through the mountain range, by the combined ability of which she now and for all time can divert but 91/250 of the water of her own river. In other words, if, in fact, (though such is not the case) all the waters had actually been so applied to beneficial use in Wyoming, prior to the Colorado development, Wyoming contends that under the rule of priority she may lay claim to an exclusive use of the Colorado as well as the Wyoming river, notwithstanding the fact that the Wyoming diversions were all made with full knowledge of the necessities of Colorado, the aridity of her fertile lands and her right as a state to ultimately use her own great resource, her waters, to make her arid lands productive and to sustain herself and her people.

The assertion of such a rule is to deny its application to the settlement of interstate controversies over rivers. Its fundamental principles forbid its use. It would deny to the state of origin all the waters of the streams and give their entire benefit to a state foreign to the source, thereby, in effect, to invade and take the domain of one state and to give it to another, without consent, compensation or even regret. It would be the assertion by a foreign state of full, complete and exclusive jurisdiction over a portion of the domain of another state; a claim contrary to the law of nations and ultimately leading to disregard of all rules of international law and respect for the rights of other states of equal dignity. The taking of the property of one country and giving it to another, under rules of international or interstate law, has the same effect upon her domain as though it were invaded by armies. In the end the domain of one state is laid hold of for the benefit of another and the property of the former is taken away that she may perish, and given to the other that she may prosper. Any such a rule would violate the rights of independent nations of equal dignity and sovereign powers, and, we believe, would not be applied as a rule of settlement by a court of international arbitration. With equal force, it cannot apply between states of the Union of equal dignity, powers and jurisdiction, and with equal rights to use and receive the benefits of their own resources according to their present or future necessities, free from claims of foreign servitude.

The usufructuary rights of the individual citizen of Wyoming are defined by the Constitution, laws and decisions of the courts of that state. The rights of the private citizen are there permitted to attach under the fundamental doctrine of priority by appro-

priation with such modifications and limitations as the state has seen fit to assert, according to its peculiar local conditions and necessities, and with the reserved power of the state to take them away from the citizen, by eminent domain, whenever necessity may require. But the local law of Wyoming can have no extra-territorial effect, and especially when prejudicial to the rights of other states.

> "It is difficult to conceive upon what ground a claim can be rested, to give to any municipal laws an extra-territorial effect, when those laws are prejudicial to the rights of other nations, or to those of their subjects. It would at once annihilate the sovereignty and equality of every nation which should be called upon to recognize and enforce them; or compel it to desert its own proper interest and duty to its own subjects in favor of strangers, who were regardless of both. A claim, so naked of any principle or just authority to support it, is wholly inadmissible."
>
> Story on Conflict of Laws, Sec. 32, p. 29.

> "Now, the general rule certainly is, that every legislative act ought to receive a reasonable construction; and it cannot be presumed that a legislature authorizes any act to be done in a foreign territory, when that act is beyond the reach of its proper jurisdiction or sovereignty. Every legislature, however broad may be its enactments, is supposed to confine them to cases or persons within the reach of its sovereignty."

Farnum vs. Blackstone Canal Co., 1 Sumner 46, 62.

Schooner Exchange vs. McFaddon, 7 Cranch 116, 136.

Cooley Const. Limitations (7th Ed.), p. 176.

Hilton vs. Guyot, 159 U. S. 113.

One state cannot expropriate for its public purposes property within the territory of another state.

"Every sovereign state may exercise the power of eminent domain—no state can exercise the power by taking or injuring property outside its territorial limits."

10 An. & Eng. Enc. Law, p. 1051.

"No sovereign, according to modern international law, can exercise the prerogative of sovereignty in any domain but his own. * * * By the law of nations one government cannot enter upon the territories of another, or claim any right whatever therein."

Wharton Int. Law Digest, Vol. I, p. 38-9.

Crosby vs. Hanover (N. H.) involved the right of officers of New Hampshire to expropriate territory of Vermont for abutments of an interstate bridge:

"Our courts and the officers of our laws have no jurisdiction as such to do any act or take any property in that State. Our official powers are confined to the limits of our own State, and the court in this case cannot require or authorize the town to go into Vermont to take the property of the corporation there, and the commissioners had no power to condemn property situated in that State.

They could take the franchise of the corporation, because that exists in this State, and by its laws; and they could take all the property in this State necessary for the purposes of building the bridge; but they had no jurisdiction or power beyond the limits of the State."

Crosby vs. Hanover, 36 N. H. 404, 423.

"The question has arisen whether, by virtue of the right of eminent domain, one state can take, or subject to public use, land in another state, and the decisions have naturally been against such a power. (Citing cases.)

The rule which has been referred to is based upon the principle that the improvement of the navigation of navigable rivers within a state is part of the state's governmental duties, and that the work which is done towards such improvement is done in the discharge of the governmental powers of the state, and that the land of the riparian proprietor within the state is subject to the just exercise of this power; and that when the state undertakes to exercise its governmental power, the public good is paramount to the consequential injury of land which is incidentally and necessarily affected by the improvement. The land is under the jurisdiction of the state and the state derives the power to inflict remote and consequential injuries upon it by virtue of such jurisdiction. The owner of land abutting upon a navigable river owns it subject to the right of the state to improve the navigation of the river, because the land is with-

in the governmental control of the state; but it seems to me *that the state obtains by virtue of its governmental powers no control over or right to injure land without its jurisdiction.* Jurisdiction confers the power and the right to inflict consequential injury, but when no jurisdiction exists the right ceases to exist. It is a recognized principle that the statutes of one state in regard to real estate cannot act extra-territorially. As Connecticut has no direct jurisdiction or control over real estate situate in another state, it cannot indirectly, by virtue of its attempted improvement of its own navigable waters, control or subject to injury foreign real estate."

Holyoke Water Power Co. vs. Connecticut River Co., 52 Conn., 570, 575-6.

In *McCarter vs. Hudson County Water Co.* citizens of New York were prohibited from taking away from New Jersey a part of the waters of its stream without its consent and contrary to its express statutory prohibition. In the opinion by the Court of Errors and Appeals, Mr. Justice Pitney thus answers the assertion that the people of the neighboring state of New York had a natural right to the use of the waters of New Jersey, if such a use could be granted without impairing the rights of individual riparian owners upon the New Jersey stream:

"Stripped of all circumlocution, what is asserted is the right of the people of New York to derive an artificial water supply from the territory of New Jersey without the consent of the people of this state. This argument, however, is at once overthrown

by reference to the established principle that one state cannot expropriate for its public purposes property within the territory of another state." (Citing cases.)

"To admit that the people of the State of New York have any inherent right to gain a water supply from the lakes or streams of New Jersey by means of an artificial aqueduct constructed for the purpose is to assert that the sovereignty of New York extends to some extent and for some purposes over the soil of New Jersey. To state the proposition is to refute it. Such interstate rights can be acquired only by interstate compact.

We have been privileged to see in print an opinion recently submitted to the Merchants' Association of New York by Mr. Randolph, author of the well-known work on eminent domain, upon the question of an interstate water supply for that city. Referring to 'that interest in water which each state possesses as the guardian of its community,' he says:

'I think it is clear that the right of an individual or corporation to divert water, whether gained by public grant *or by prior appropriation*, is presumed to be utilized within the state, which may forbid the carriage of the water beyond its bounds.'

And he uses this language:

'And when we point out that each state holds all the property in its territory free from the eminent domain of another, and cannot be compelled to surrender its prop-

erty to another in any way, I think we approximate the irreducible measure of sovereignty in this relation.' "

McCarter vs. Hudson County Water Co., 70 N. J. Eq. 695, 717.

While immediately following the above languafe, Mr. Justice Pitney observed that the case there presented is not parallel with a case which might arise on an interstate stream, it will be observed that his opinion was largely limited by the decision on demurrer in *Kansas vs. Colorado* (185 U. S. 125), and that he did not have the benefit of the final decision in that case (206 U. S. 46).

The fundamental rule that one nation cannot exercise its sovereign power and jurisdiction over the waters or domain of another nation without her consent and cannot expropriate the waters of an upper nation for the use of the lower nation by claim of *prior appropriation* even on an international river, has been recognized and followed by the United States in its relations with Mexico. Mexico made complaint of injury by diminution of the Rio Grande River by citizens of the United States in Colorado and New Mexico, and asserted a preferred right to the use of the stream by prior appropriation by certain of the citizens of Mexico. It was held that Mexico could not, under any rule of international law, lay claim to the waters that had their source within the United States, and that to claim the waters by prior appropriation would be to assert a *servitude* upon the domain of the upper nation. The facts there presented are so nearly parallel with the contention here made by Wyoming that we quote at length from the opinion of Attorney General Judson Harmon:

"There have been disputes about rights of navigation of international rivers, but they have been settled by treaty. (For a list of such treaties see Heffter Droit Int., Appendix VIII.) The subject is fully discussed by Hall (Int. Law, sec. 39), who denied that the people on the upper part of a navigable river have a natural right to pass over it through foreign territory to its mouth. But if such right be conceded, no aid is afforded for the present inquiry, because use for navigation, being common, would not curtail use by the proprietary country, while in the case now presented, there not being enough water for irrigation in both countries, the question is, which shall yield to the other.

It is stated by some authors that an obligation rests upon every country to receive streams which naturally flow into it from other countries, and they refer to this as a natural international servitude. Heffter Droit Int., sec. 43; 1 Philemore Int. Law, p. 303.) Others deny the existence of all international servitudes, apart from agreement in some form. (Letters of Grotius quoted, 2 Hert., p. 106; Kluber Droit des Gens Moderne, sec. 139; Bluntschli Droit Int. Cod.; Woolsey's Int. Law, sec. 58; 1 Calvo Droit Int., sec. 556.)

Such a servitude, however, if its existence be conceded, would not cover the present case or afford any real analogy to it. The servient country may not obstruct the stream so as to cause the water to back up and overflow the territories of the other.

The dominant country may not divert the course of the stream so as to throw it upon the territory of the other at a different place. (See authorities *supra.*) In either of such cases there would be a direct invasion and injury by one of the nations of the territory of the other. But when the use of water by the inhabitants of the upper country results in reducing the volume which enters the other, it is a diminution of the servitude. The injury now complained of is a remote and indirect consequence of acts which operate as a deprivation by prior enjoyment. *So it is evident that what is really contended for is a servitude which makes the lower country dominant and subjects the upper country to the burden of arresting its development and denying to its inhabitants the use of a provision which nature has supplied entirely within its own territory.*

Such a consequence of the doctrine of international servitude is not within the language used by any writer with whose works I am familiar, and could not have been within the range of his thought without finding expression.

Both the common and the civil law undertake to regulate the use of the water of navigable streams by the different persons entitled to it. Neither has fixed any absolute rule, but both leave each case to be decided upon its own circumstances. But I need not enter upon a discussion of the rules and principles of either system in this regard, because both are municipal and,

especially as they relate to real property, can have no operation beyond national boundaries. (Creasy Int. Law, p. 164.) So they can only settle rights of citizens of the same country *inter sese. The question must, therefore, be determined by considerations different from those which would apply between individual citizens of either country.* Even if such a question could arise as a private one between citizens of one country and those of another, it is not so presented here. The mere assertion of the claim by Mexico would make it a national one even if it were of a private nature. (Gray vs. United States, 1 C. Cls. R., 391-392.) But the use of water complained of and the resulting injuries are general throughout extended regions, so that effects upon individual rights can not be traced to individual causes, and the claim is by one nation against the other in fact as well as form.

The fundamental principle of international law is the absolute sovereignty of every nation, as against all others, within its own territory. Of the nature and scope of sovereignty with respect to judicial jurisdiction, which is one of its elements, Chief Justice Marshall said (*Schooner Exchange vs. McFaddon*, 7 Cranch, p. 136):

'The jurisdiction of the nation within its own territory is necessarily exclusive and absolute. It is susceptible of no limitation not imposed by itself. *Any restriction upon it, deriving validity from an external source, would imply a diminution of its sovereignty to the extent of the restriction.*

All exceptions, therefore, to the full and complete power of a nation within it own territories must be traced up to the consent of the nation itself. They can flow from no other legitimate source.'

It would be entirely useless to multiply authorities. So strongly is the principle of general and absolute sovereignty maintained that it has even been asserted by high authority that admitted international servitudes cease when they conflict with the necessites of the servient state. (Bluntschli, p. 212; see criticism by Creasy, p. 258.) Whether this be true or not, its assertion serves to emphasize the truth that *self-preservation is one of the first laws of nations. No believer in the doctrine of natural servitudes has ever suggested one which would interefere with the enjoyment by a nation within its own territory of whatever was necessary to the development of its resources or the comfort of its people.*

The immediate as well as the possible consequences of the right asserted by Mexico shows that its recognition is *entirely inconsistent* with the sovereignty of the United States over its national domain. Apart from the sum demanded by way of indemnity for the past, the claim involves not only the arrest of further settlement and development of large regions of country, but the abandonment, in great measure at least, of what has already been accomplished.

* * * * * * *

It is not suggested that the injuries complained of are or have been in any measure due to wantonness or wastefulness in the use of water or to any design or intention to injure. The water is simply insufficient to supply the needs of the great stretch of arid country through which the river, never large in the dry season, flows, giving much and receiving little.

The case presented is a novel one. Whether the circumstances make it possible or proper to take any action from considerations of comity is a question which does not pertain to this Department; *but that question should be decided as one of policy only, because, in my opinion, the rules, principles, and precedents of international law impose no liability or obligation upon the United States.*" (Italics ours.)

Opinions of Attorneys General, Vol. XXI, p. 280-3.

The complainant on pages 174-6 of the supplemental brief quotes the last paragraph in the foregoing opinion of Judge Harmon and places an erroneous construction upon the word "novel" as there used. The conclusions which counsel draw are however, not in full accord with the recommendations made by Judge Harmon, that "The question should be decided as one of policy only, because, in my opinion, the rules, principles, and precedents of international law impose no liability or obligation upon the United States". The United States did settle the controversy upon the grounds of international policy and by treaty, as all such matters are usually

adjusted between friendly nations, a power still reserved to the states of the United States, the consent of Congress first having been obtained.

When the United States, as a matter of international policy but not of international law, settled the differences over the Rio Grande with Mexico it took the precaution to so word the treaty that the adjustment could never be taken as a recognition of any lawful claims by Mexico and in Article 5 provided:

> "The United States, in entering into this treaty does not thereby concede, expressly or by implication, any legal basis for any claims heretofore asserted, or which may be hereafter asserted, by reason of any losses incurred by the owners of land in Mexico, due, or alleged to be due, to the diversion of the waters of the Rio Grande within the United States; nor does the United States in any way concede the establishment of any general principle or precedent by the concluding of this treaty."
>
> Art. V, Treaty of May 1, 1906.

The same observation may be made with regard to the letter of Secretary of State Evarts of Jun 12. 1880 (cited on page 175) which was likewise considered a matter of international policy rather than international law and by express provisions, the letter referred primarily to private property interests of citizens.

Denial of right of international servitude by claims of prior appropriation for citizens of a lower nation upon an international stream, as defined in the opinion of Judge Harmon, has never been questioned so far as we are able to ascertain. Denial of such international servitudes seems to have been ac-

cepted as a proper interpretation of the principles governing such claims. The position taken by Judge Harmon is in large measure approved by this Court, as regards interstate streams. In Kansas vs. Colorado it was admitted that certain ditches in Kansas had prior claims to those in Colorado and that the Colorado diversions had diminished the water supply of these Kansas canals, but this court refused to enjoin the state of Colorado on account of such diminution of the supply of the stream. Mr. Justice Brewer said:

> "At one time there were some irrigating ditches in these western counties, which promised to be valuable in supplying water and thus increasing the productiveness of the lands in the vicinity of the stream, and it is true that those ditches have ceased to be of much value, the flow in them having largely diminished.
>
> It cannot be denied in view of all the testimony * * * that the diminution of the flow of the water in the river by the irrigation of Colorado has worked some detriment to the southwestern part of Kansas, and yet when we compare the amount of this detriment with the great benefit which has obviously resulted to the counties in Colorado, it would seem that equality of right and equity between the two states forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation. * * *
>
> Summing up our conclusions, we are of the opinion * * * that the appropriation of the waters of the Arkansas by Colo-

rado, for purposes of irrigation, has diminished the flow of water into the State of Kansas; that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both states and the right of each to receive benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes."

Kansas vs. Colorado, 206 U. S. 46, 113, 117.

That the application of the doctrine of priority without regard to state lines would be a recognition of extra-territorial servitudes is recognized in Bean vs. Morris, involving an interstate stream:

"We assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such *private* rights and obligations as are in dispute, across their common boundary line. Missouri vs. Illinois, 200 U. S. 496, 521; Rickey Land & Cattle Co. vs. Miller & Lux. 218 U. S. 258, 260. But with regard to such rights as came into question in the other states, we believe that it always was assumed, in the absence of legislation to the contrary, that the states were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state that could be acquired from within."

Bean vs. Morris, 221 U. S. 485, 486.

But here there is no "absence of legislation to the contrary" and neither state is "willing to ignore boundaries and allow the same rights to be acquired from outside the state that could be acquired within." *On the contrary, both states by their constitution, laws and the decisions of their courts reserve their waters for themselves and deny and declare against any servitudes for the benefit of neighboring states.*

See Constitutions, Statutes and Decisions, (*Supra*) (pp. 148 to 174.)

Lamson vs. Vailes, 27 Colo. 201, 203.

Stockman vs. Leddy, 55 Colo. 24, 27.

S. L. Colo. 1917, Chap. 151, p. 539.

Farm Inv. Co. vs. Carpenter, 9 Wyo. 110, 135.

Grover Irr. Co. vs. Lovella D. Co. 21 Wyo. 204.

Of the decisions and statutes of Colorado we have heretofore commented at length.

The decisions of the Supreme Court of Wyoming deny her assertions of right to expropriate the waters of Colorado for the use of Wyoming. Subsequent to the filing of the bill of complaint herein (and on April 7, 1913) the Supreme Court of Wyoming denied the right of Colorado citizens to expropriate lands and water in Wyoming for use in Colorado notwithstanding the fact that the stream was interstate and common to the two states in the same degree as is that portion of the Laramie river here involved, save for the fact that with the stream there involved, Crow Creek, the conditions are reversed, the stream having its source in Wyoming and flowing into Colorado. While Wyoming here asserts a right (by prior appropriation) to all the waters of that portion of the Laramie river in Colorado and would impose a perpetual servitude upon Colorado domain and natural resources for the *exclusive* use and benefit of Wyoming, and asks that Colorado be perpetually enjoined from using her great tunnel enterprise; yet, when the conditions were reversed and Colorado citizens made claim to the right to use but a portion of the waters of a stream having its source in Wyoming and flowing into Colorado, Wyoming declared against any such servitudes and denied the right of Colorado to impress any such dominant estate upon Wyoming territory, irrespective of the fact that the district court had found that the use of water of the stream in Colorado would bring immediate returns to adjacent Wyoming territory. Chief Justice Potter in a most exhaustive opinion, denies the right of one state to expropriate property of another and in a most learned manner reviews the decisions. Owing to the immediate im-

portance of the decision and its unqualified approval of the authorities we have already cited we quote at some length from the sixty page opinion:

> "Eminent domain is generally defined as the right or power of a sovereign state to appropriate private property to particular uses, for the purpose of promoting the general welfare. * * * *In this respect the several states are distinct and independent of each other*, respectively possessing and exercising the power for their own purposes of their public welfare. 'The eminent domain in any sovereignty exists only for its own purposes.'"

He then discusses the essential elements of the power of eminent domain and its use for the purposes of state or public welfare and says:

> "It is also well settled that a state cannot take or authorize the taking of property or rights in property situated in another state. (Citing cases.) 'One state cannot expropriate for its public purposes property within the territory of another state.' (McCarter vs. Hudson W. Co., 70 N. J. Eq. 695).
>
> 'The question has arisen whether, by virtue of the right of eminent domain, one state can take, or subject to public use, land in another state, and the decisions have naturally been against such a power.' (Holyoke W. P. Co. vs. Conn. R. Co., 52 Conn. 570, 575; s. c. (C. C.) 20 Fed. 71, 79).
>
> The principles above stated seem to have been recognized by the trial court in this case, if we may refer to a quotation

from the opinion of the learned judge found in the brief of counsel for defendant in error, for the ground of the decisions seems to have been that the proposed irrigation of the lands, which lie just over the line of this state in the State of Colorado, will be of material benefit to a considerable part of the inhabiants of a section of this state, since it may lead to the growth of towns and the creation of new channels for the employment of capital and labor. * * * This line of argument is not without some force, but we think it disregards or misconceives the theory or public interest supporting the exercise of eminent domain for irrigation works or the irrigation of land, and would, in effect, if sustained, permit the exercise of eminent domain in this state by the State of Colorado, or any other state, for its own uses and purposes."

Then follows a review of authorities on public character of private enterprises, founded on the rules of local necessity, and continues:

"*The irrigation of land in a neighboring state,* and so also the building of a railroad in that state, or the development of its mines or other natural resources, may no doubt result in some benefit to the people of this state, but only in the general way that one state is benefited by the growth in industrial activities, population and wealth of an adjoining state, or even of a more distant state or the nation at large. To accept that, however, as a sufficient reason for taking land in this state under the power

of eminent domain, if for the *purpose of irrigation,* would not tend to advance the interest of this state in the reclamation and cultivation of its lands, or the development of its natural resources, but the effect might be entirely the reverse, and it would abandon the principle upon which the right to exercise the power for irrigation and other analogous purposes has been asserted and maintained. The headgate and ditch by which water for agricultural purposes is diverted and distributed is not the use for which land required for a right of way is taken; *the use authorizing such a taking is the application of the water to the land.* The use, whether public or private, therefore, occurs where the water is applied; that is, where the land to be irrigated is located. If located in another state the use is there, and that use must support the exercise of eminent domain for a right of way for the ditch, if it is to be supported. *Since in this case it appears that no land in this state will receive for its reclamation or cultivation any of the water to be diverted or distributed by means of the ditch, but the water is to be entirely devoted to the irrigation of land in another state, the use will be in and for that state*—for its uses and purposes, and not in this state or for any of its purposes. The principle above discussed, that the power of eminent domain will be exercised by a state for its own purposes, and not for the use of another state, seems, therefore, to be applicable. *Clearly the State of Colorado cannot exercise the pow-*

er in this state, and any authority conferred by its laws to do so would be void, for it is fundamental that the soverignty of any government is limited to persons and property within the territory it controls." (Citing cases.)

"While this state may be interested and even indirectly benefited in the manner above indicated by the reclamation and settlement of lands in another State, it would be difficult, we think, to uphold the exercise of eminent domain in this state on the ground that such reclamation and settlement in another state is a necessity of the government of this state, in view of the fact that within its own boundaries and in all parts of the state there are vast areas yet uncultivated capable of irrigation and reclamation."

After a review of the "mill" cases from the New England states, he continues:

"Since the purpose is solely to irrigate lands in another state, it is not material that the headgate is to be located but a short distance above the southern boundary line of this state, or that the lands to be irrigated are located just over the line in the adjoining state. It would make no difference in principle if it was proposed to divert the water from some stream in the interior or elsewhere in our state much farther removed from the lands to be irrigated, or if it was proposed to irrigate lands in another state situated at a greater distance beyond our territorial limits. * * *

* * * *It is a familiar elementary principle that the laws of a state have no extra-territorial effect.* And it is not necessary for a state statute to contain words expressly confining its operations within the state.

* * * * * * *

In a concurring opinion in Salisbury Mills vs. Forsaith, (57 N. H. 174) it was said: 'It is one of the plainest elementary rules, that no legislature can extend its laws to territority beyond the borders of its own state. How, then, can the courts of this state have any jurisdiction over dams and mills in another state?' And in Wooster vs. Great Falls Mfg. Co. (39 Me. 246) it was said by the Court: 'All legislation is necessarily territorial. The statutes of a state are binding only within its jurisdiction. The legislature cannot, if they would, authorize acts to be done in a foreign territority. * * * They cannot affect or control property elsewhere, and it is not to be presumed they intended to exceed their jurisdiction.' Mr. Justice Story, in Farnum vs. Blackstone Cand., 1 Sumner, 62, Fed. Cas. No. 4,675, remarked: 'Every legislature, however broad may be its enactments, is supposed to confine them to cases or persons within reach of its sovereignty.' "

In conclusion the Colorado citizens were denied the right to expropriate a right of way for their canal and incidentally denied the use of water from the stream in Wyoming.

Grover Irrigation & Land Co. vs. Lovella Ditch Co., 21 Wyo. 204, 240, 255, 260.

We have no quarrel with the foregoing decision or its effect upon the Colorado citizens. Without doubt Wyoming should fully protect her territory and waters from foreign servitudes and her Supreme Court very properly denied to Colorado citizens the right to make Wyoming domain servient to any use of water in Colorado, even though some benefits might accrue to Wyoming thereby. "What it has it may keep and give no one a reason for its will." *But we fail to see any merit in the claim of Wyoming for perpetual servitude upon the domain of Colorado, the waters of her streams, when she at the same time denies to Colorado a similar servitude when the conditions are reversed.* Wyoming very properly refused to permit a like servitude upon Crow Creek and properly retained the stream for herself for her future as well as her present needs. It would seem that Colorado would have an equal right to deny to Wyoming a servitude upon the waters of the Colorado branch of the Laramie River.

Further citation would seem unnecessary to define the doctrine of prior appropriation irrespective of state lines as a doctrine of extra territorial servitudes, without consent of the servient state, to all or a portion of the waters of the stream in one state for the exclusive benefit of another state, and therefore inapplicable for determination of the rights of equal sovereign states to their control and use of waters of streams common to both.

(d) Exclusive Claim—Equal Division.

As we understand the term "equal" when used with reference to the states, it refers to that equality in the family of states which obtains with nations in the family of nations. Each state has an equal right to not only govern itself but as well

to maintain itself and improve its domain, increase in population and promote for the present and for all time the general welfare of itself and its citizens. But if, (purely by way of illustration) we were to use a narrower construction and say that equal states have the right to enjoy an equal part of an interstate stream, even then the doctrine of appropriation is inapplicable for it takes from one state an exclusive (not equal) portion of the waters of the stream and gives it to the other without remuneration. The rule of priority is unequal among the users of water. It gives to the one and excludes the other. It cannot, therefore, apply if each state is entitled to an equal portion of the water of a river common to both.

(e) States Look to Future—Not Past.

Still another thought suggests itself. Priority is a rule of the past and not of the future. States must look to the future more than to the past. They must preserve and provide not for the past, but little for the present, and more for the future. As well observed by Mr. Justice Holmes:

> "We are of opinion, further, that *the constitutional power of the state to insist that its natural advantages shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs.* The legal conception of the necessary is apt to be confined to somewhat rudimentary wants, and *there are benefits from a great river that might escape a lawyer's view.*
>
> But the state is not required to submit even to an aesthetic analysis. Any analysis may be inadequate. It finds itself in posses-

sion of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will."

Hudson Co. Water Co. vs. McCarter, 209 U. S. 349, 355.

Priority looks alone to the past. Its antiquity is its chief asset. The state on the other hand may find its future needs so imperative that it must extinguish, by the power of eminent domain, even the usufructuary property rights it has permitted its citizens in its streams and take the waters for a greater need. How then could the limited right of a state, determined upon rules of priority of appropriation, as regards another state, be reconciled with its future imperative necessities. It may extinguish, or resume as it were, the property of its citizens, be they ever so ancient, but it cannot take away the rights of another state or the property of its citizens. (See authorities *supra*). Bound hand and foot it would find itself, ensnared within the meshes of a net of private property law improperly applied to interstate relations, and would be helpless to control a resource within its domain and burdened forever with foreign servitude against its will. It would find itself bound down by antiquities and powerless to defend itself or to provide for the then present or its future needs.

(f) Conclusion.

It is the stream of water rising and flowing within the domain of the state (not mere private usufructuary rights) which is and ever must remain one of its greatest resources. By preservation of the stream it provides for its present and future necessities. It may grant to the citizen his usufructuary

right by any system of private property law it may choose, whether riparian, appropriation, both in combination or any other and new system it may devise, but always inferior and subordinate to the right of the state to have the last and final word. The river after all must ever remain within its sovereign control. The river it must now and for all time keep, preserve and protect and no system of private property law now devised, either riparian or appropriation, can adjust interstate relations and at the same time preserve the river, as a river after all, for the state and all its future generations.

And whatever claim of priority of appropriation Wyoming may have made; whatever she may have proved or failed to prove of the early claims of her citizens to the waters of the river from Colorado, the fact remains, after all, that the river in Colorado is her great natural resource, which she has and must keep, now and for all time irrespective of the claims, or the assent or dissent of her private citizens. And likewise too with that portion of the river rising and flowing in Wyoming. It is Wyoming's resource and her's in a greater degree than mere past or present user. It she must likewise keep now and for all time. Either state may tomorrow sweep aside with but pecuniary reward all the rights of her citizens vested and recognized under laws of appropriation varying as they do in the two states, and may retake the stream as of her first and former estate, to do with as she may will and as her future needs and conditions may require, but this she cannot do if the river shall have been taken away by extra-territorial servitudes of the neighboring state.

Wyoming here asserts claim to all the waters of the Colorado portion of the Larimie River (save for the inconsequential use in the narrow mountain

valley) and we have presented the case from that viewpoint. But whether the lower state shall demand all or part of the water by prior appropriation, the principle is the same and the difference in effect is but one of degree. The right in any event is exclusive and would create a perpetual servitude upon the upper state and its resources, without its consent, for the exclusive use of the water of the stream.

We believe sufficient appears, without further discussion of authorities to warrant us in drawing the conclusoin that the doctrine of priority by appropriation is a rule of local law, *intra-state and not interstate* in application and defines merely the right of one citizen with regard to the rights of other citizens of the state wherein the appropriation is made and to some degree his relation to the state itself in the administration of the usufructuary rights of the several appropriators; that the usufructuary right is exclusive in the appropriator and if his needs so require he may consume all the water of the stream regardless of other appropriators or the location of the lands to which the water is applied; that the application of this rule of usufructuary private right to interstate controversies would be in violation of the equal sovereign rights of each of the states involved for the several reasons which we have assigned and that the application of the rule would be to declare an involuntary, exclusive servitude upon the property and natural resources of one state for the benefit of a neighboring state and would amount to extra-territorial expropriation of the property of one state for the benefit of another state and its citizens.

There are other and more practical reasons why the rule cannot be applied between the states. The difficulty encountered is not so much the interpreta-

tion of the law as it is the enforcement thereof. In fact the *intra state* administration of the law of priority of appropriation has involved solution of many complicated problems constantly presenting themselves in the years of the development of this state or local administration and these problems must be met in the future. We shall therefore comment at some length upon this phase of the subject.

(3) THE DOCTRINE OF PRIOR APPROPRIATION, REGARDLESS OF STATE LINES INEQUITABLE AND INCAPABLE OF ADMINISTRATION.

(a) Change or Conflict of Laws.

Counsel for plaintiff, in one portion of their supplemental brief, contend in substance that inasmuch as both Colorado and Wyoming have adopted in its fundamental essentials the doctrine of appropriation, that this rule must be applied between the states and is the principle of law which should govern this controversy. But counsel overlook the fact that the systems prevailing within the two states are radically different, save for priority and that even under the fundamental rule of priority there are different fundamental limitations to the right in each state. They appear to have adopted the theory that if the two states involved in the controversy have adopted the doctrine of appropriation, then that principle must govern in a controversy between them concerning waters of a stream common to both, irrespective of differences in the principle as applied, and overlook the reserved power of the state to extinguish all private titles according to its sovereign will. On the other hand, it is contended, if one state has adopted the doctrine of appropriation and the other adhers to the common law of riparian rights, that then the

water in the streams common to both states must be divided upon an equitable basis. Mr. Kinney is cited as authority but we observe, he cites no authorities sustaining his position. It will be of interest to know upon what theory the plaintiff would attempt to solve the problem if one of the states to the controversy had adopted the law of appropriation and the other had both systems, that is to say, that it recognized the common law doctrine of riparian rights, but modified it by permitting, under certain conditions, the priority of appropriation to govern, as has been done in several of the states, notably California and Nebraska. Again, it is of interest to ask what would be the result if the principle of appropriation were declared to be the established law as between two states in which priority of appropriation governed and, thereafter, one of these states, as it undeniably has the right to do, should change its position and adopt the common law doctrine of riparian rights in place of its previous law of priority of appropriation. It is apparent at a glance that the determination of the rights of the various appropriators in the two states upon the basis of priority of appropriation would be thrown into complete and absolute confusion if one of the states should thereafter repudiate the doctrine and adopt the common law. "Neither state can legislate for or impose its own policy upon the other." Moreover, "Congress cannot enforce either rule upon any state."

The topographical and other natural conditions surrounding the State of Colorado are peculiar. The Court will take judicial notice of these, although for that matter, a full statement of these conditions is given in the evidence.

In fact, we are indebted to counsel for the plaintiff for a statement to the effect that Colorado is up-

on the apex or crest of the continent and is situated in an arid region requiring irrigation for successful agriculture. We add that the rainfall in the arable sections of the state is not sufficient without irrigation to produce successful crops and that irrigation is therefore a necessity, so much so that water for irrigation is probably, aside from the land itself and the things which are included within the term land, the most valuable asset in the state, and that every effort has been put forth by the state and its citizens to develop irrigation systems whereby water for irrigation might be provided, including the construction of reservoirs for the conservation of flood waters which would otherwise escape without beneficial use. The streams rising in Colorado flow out of the state in all directions. To the east the main streams are the South Platte and Arkansas rivers and other smaller streams which need not be mentioned; to the south are the Rio Grande and San Juan rivers with other smaller ones; to the west, the Grand, the Dolores, and the Green river which, uniting with the Grand, form the Colorado river; and to the north, the North Platte, the Laramie and other smaller streams. From no other state does Colorado receive any water, with the exception of a few small streams entering the state from Wyoming in certain portions of its northern border, and the further exception of the Green river which rises in Wyoming, flows into Utah and then loops back for a very short distance into the western border of this state. The exceptions are merely sufficient to prove the rule.

The strange feature of this case is that the topographical position of Wyoming is similar to that of Colorado and that streams leave her borders on the west, north and east, and somewhat to the south, and we are impressed with the thought expressed in the

opinion of the Court in Bean vs. Morris, wherein the right of an appropriator in Montana was determined as against an appropriator in Wyoming, and the Court said, assuming that Montana is willing to have rights acquired against her citizens by appropriators in the lower states, "Montana cannot be presumed to be intent on suicide, and there are as many if not more cases in which it would lose as there a' in which it would gain if it invoked a trial of strength with its neighbors." Surely Wyoming is intent upon suicide, but the regrettable feature of the situation from our standpoint is, that if she is permitted to commit suicide, she at the same time will murder Colorado.

(b) Disappearing Rivers.

Colorado is largely mountainous and this mountain area is the source of supply of her water. The eastern portion of the state, generally speaking about one-third the area of the state, is in the Great Plains region, and on the north, west and south, while there are no areas which may be properly called plains, there are, nevertheless, isolated areas of greater or less extent, arable in their nature and capable of cultivation, but all of these areas depend upon the supply of water furnished by the mountains.

These streams after leaving the mountains have a history which is the converse of that of the streams in the humid regions. After the streams in Colorado have received their supply of water from various sources in the mountains, and in their course enter the Great Plains areas, because of the aridity of the climate they immediately begin to lose or diminish, instead of increasing in their flow like streams in the less arid sections of the country. This is the natural

condition and it is modified only in this, that diversion of water on the upper reaches of the stream, more particularly in the conservation of flood waters which usually come in the latter part of May and the first of June, and the application thereof upon the lands under irrigation, results in producing an unnatural condition for the area, in that the lands under irrigation become to a degree saturated with water and there is a constant and ever increasing amount of return and seepage water from these lands into the stream. Fortunately for Colorado, the earliest development in irrigation was upon lands lying adjacent to the mountains and the development which resulted brought about in turn greater demands for water, thereby bringing about further development through the construction of reservoirs with the general result that through the use and re-use of the return and seepage waters, the irrigation in the state has progressed step by step down stream until today many times the amount of land for which water was first available is now receiving a satisfactory supply of water. To put it in another way, irrigation has produced an unnatural condition which, in a limited way, causes these streams to receive a source of supply in a manner similar to the natural increase in the streams in humid regions. Of course we do not contend that the actual amount of water in the state of Colorado is increased. What we do contend is, that the process of irrigation has resulted in an enlarged flow of the stream during the seasons in which in earlier years the stream was either low or practically dry, depending upon the location considered. The flood waters which formerly passed without benefit to any one, are now, so far as it is possible to do so

to advantage, intercepted, stored and later used for irrigation and the flow of streams is by means of this irrigation equalized and maintained during the season of the year when the streams were of nature practically dry, and in some instances absolutely dry along portions of their courses.

Let us illustrate by referring to the Arkansas river which is the stream considered by the Court in the case of Kansas against Colorado. This stream leaves the mountains some distance west of Pueblo and enters its course across the plains, naturally losing water with every foot of its length. From the point where it leaves the mountains to the state line is a distance by meander of possibly 150 miles and until the stream enters a region of higher precipitation, there is a constant loss to such an extent that it was contended in the Kansas-Colorado case that the stream was a broken river, in other words, that there was a length of its bed or channel in which no water flowed under normal conditions. However, the application of the water for irrigation on the upper reaches of the stream has resulted, as described, in a very rapid increase of return, seepage and percolating water to the stream and the flow of the stream is definitely known to be greater at the state line than it was before any irrigation was practiced in Colorado with the possible exception of the flood period. This is also particularly true of the South Platte river upon which the city of Denver is located.

In the absence of this artificial condition which of course is not yet complete, it being a condition which is enlarging and progressing from year to year, it is a scientific fact which cannot be denied, that in order to supply 100 cubic feet, for illustration, in western Kansas

from the Arkansas river, or in western Nebraska from the Platte river, it would be necessary to permit many times that amount of water to pass, say the City of Pueblo on the Arkansas river, or the city of Denver, on the Platte river. In other words, the citizens of Colorado, particularly those on the upper reaches of the stream, must be deprived of a large amount of water necessary for their well being in order to supply a small amount of water to persons in Kansas and Nebraska. Consider in this connection the U. S. Census report 1910, giving the total area of Colorado as 66,341,120 acres, of which only 2,792,032 or 4.2% is irrigated.

May we direct attention to the evidence upon these points.

(See testimony of John E. Field, State Engineer of Colorado, pp. 1382-1387;
Prof. L. G. Carpenter, pp. 2992-3042; 3077-3092).

The unnecessary loss occasioned by depriving the state of origin of control of its waters and by causing the water to pass down losing streams in order to supply some prior appropriator in another state would appear to be so wasteful and so lacking in its applicability to the situation as to be inequitable and unjust.

While the state may determine its own local rules whereby it may obtain the greatest good from a limited resource and may permit the use, subject always to the reserved power of the state, of its waters in order of priority, yet whenever the application of such a rule, without regard to state boundaries, would not only take a natural resource from one state

and give it to another, but more, in so doing would waste the greater part of the resource it would appear wholly inequitable and inapplicable.

The law is therefore purely local, and its operation or the operation of any other law which the state may substitute for it, is confined to the artificial boundaries which define the territorial bounds of the state. These boundaries however are no more artificial in their effect upon the law of waters than they are in their effect upon many other laws,—criminal, property rights, etc. They define the territorial limits of jurisdiction. They are analagous to international boundary lines.

(c) Administration—Colorado River.

Let us take another illustration. Of these facts the Court will take judicial notice: The Green river rises in Wyoming, flows across the southern border of the state into Utah, loops back from Utah for a short distance into Colorado, returning thence into Utah where it, in conjunction with the Grand river from Colorado, forms the Colorado river. It flows thence southwesterly into Arizona, forming a portion of the boundary between Arizona and Nevada, and below that the boundary between California and Arizona, and thence into Mexico, emptying into the Gulf of California. This stream, in other words, flows within, or borders upon six states and also passes through a portion of Mexico, and irrigation is practiced in each one of these six states. While we are unable to state that water is diverted from this river in each of these six states, nevertheless, the probability is that such is the case, for it is a recognizezd fact that Wyoming, Colorado, Utah, Arizona, Nev-

ada and California each require irrigation and many large projects have been undertaken by the United States Reclamation Service and by private individuals diverting water from this stream along its course, the better known probably being those in California and Arizona, to omit the innumerable diversions upon the tributaries. The records of the United States Geological Survey further show diversions from the stream at numerous places along its course on both the upper and lower reaches, and measurements have been taken for a number of years, reported in Water Supply Papers, numbers 395 and 396, from which is apparent that the sources of supply for this stream are so remote one from another that, while there may be in a measure a continuity of flow throughout the course of the stream and its various tributaries, nevertheless, there are points of high and low flow apparent in various sections of the length of the stream. Could any advocate of the doctrine of appropriation regardless of state lines advance any hypothesis upon which this stream and its tributaries could be administered and the water apportioned to the various appropriators in the seventeen hundred or more miles of its length, upon the basis of priority of appropriation. It is impossible and the doctrine of appropriation regardless of state lines cannot be the law. Impossible conditions do not make law.

(d) Adjudication.

There is another feature wherein it is apparent that appropriation regardless of state lines cannot be the doctrine governing cases such as the one at bar. In the early history of the development of the arid west when diversions were small and few in number, the rights of respective appropriators were easily determined and enforced. As development progressed, it soon became apparent that some system of determination or adjudication of these rights was imperatively necessary and with it a method of distribution under some authorized governmental agency. In Colorado this necessity found expression in a statute requiring all rights to the appropriation of water to be determined in judicial proceedings and that the decree of the courts having jurisdiction should thereafter govern in the distribution of water, and that water officials, officers of the state, should thereafter distribute the water in accordance with the priorities found and determined in the decrees of the courts. In Wyoming the system is somewhat different. In the first place application is made to the state engineer for the right to divert water. This official passes upon the application and if unappropriated water remains in the stream he issues a permit which requires construction to be done within a limited period which may in turn be extended. Thereafter the question of the determination of the right—in other words, the decree—is made by the board of control which consists of the state engineer and the superintendents of irrigation. From this tribunal an appeal lies to the courts.

But regardless of the procedure, both states, and this is true of all the others where irrigation is practiced, found it necessary to provide a system whereby

the rights of the various appropriators could be determined, according to local state law with no reference to the laws of other states, and then the distribution of water governed according to those rights. Wyoming has had an adjudication, we do not know whether it is yet final, of the rights of the appropriators from the Laramie river in that state. To this proceeding Colorado was not a party, nor could it have been a party, neither could any of the appropriators in Colorado have been parties. Likewise the appropriations from the Laramie river in Colorado have been adjudicated by the courts of this state and to these proceedings neither the state of Wyoming nor the appropriatirs of water in Wyoming could have been parties.

There is therefore, no judicial determination of the rights of the respective appropriators in the two states, neither are the rights of the individual appropriators in the two states involved in this cause except as they become so through the soverign states to which they respectively belong. Congress, even assuming that it has jurisdiction in the matter (which we do not concede) has provided no method whatsoever for determination of the rights of these individual appropriators except as their rights may be properly adjudicated in the courts of equity of the United States. It is therefore pertinent to ask, if priority of right regardless of state lines is the principle of law which governs this controversy, how are the rights of the respective individuals to be determined, having due regard to the conflicting laws of each state, and after determination how are they to be enforced. Possibly this Court might appoint an officer or direct a United States Marshall to organize a body of men to police the stream and divide the water according to the priorities which this Court might undertake to

adjudicate, but the very suggestion shows the absurdity of the contention. No such procedure was ever in contemplation either by congress or by the respective states where water is used for irrigation. The entire adjudication and administration of priorities is founded and has been constructed on the theory of state control and is utterly in conflict with any other theory. Manifestly the doctrine of priority of appropriation does not adapt itself to interstate questions. The machinery for its administration has never been in contemplation of the Federal Government and we believe, could not be without Constitutional amendment, and no method has been provided either for the adjudication of these individual rights or for the administration of the system thereafter.

No decree, adjudicating the rights of the individual appropriators, or of the various ditches and reservoirs, could be drawn based upon the evidence introduced in this case for the reason that the same is wholly inadequate for any such purpose.

(4) ADMINISTRATION BY PRIORITY OF APPROPRIATION IMPRACTICABLE.

(a) Appropriation by Canals.

Diversion and uses of water under the rule of priority require the most rigid police regulation even in their simplest form, viz: by ditches for immediate application to lands. Many factors enter into this administration which are not revealed by the mere assertion of the simple rule of "first in time first in right".

The fundamental basis of the rule of priority of appropriation is beneficial use. The right to divert is usufructuary to the uttermost degree. Beneficial use gives the right and the instant beneficial use ceases the right terminates. The mere fact that a

canal has been constructed and lands have been irrigated does not determine that the appropriator is entitled to take water from the stream to the full capacity of the canal so long as he may wish so to do. The capacity of the canal is but the outside limit to which he may go in diverting the water of the stream under his usufructuary right and the quantity which he has the right to divert is first, and last, determined by the actual necessities of the lands to be served. This necessity in turn varies from day to day and year to year, with the difference in seasons and ever varying natural conditions, and necessarily, is as varied as the climatic and other conditions in different regions.

The appropriator's right to divert is further limited to his established uses. These established uses are measured not by the capacity of his ditch but by his previous diversions, measured by time as well as by quantity, and he is not permitted to enlarge his demands upon the stream, even within the capacity of his already established ditch, either as to time or quantity of flow, so as to deplete the supply which theretofore has passed to junior appropriators, and, in turn, the appropriation is confined to the time of the year in which the use has occurred and after which the junior has enjoyed the stream for his purposes.

Cache la Poudre Res. Co. vs. Water Supply & Storage Co., 25 Colo. 161;
Seven Lakes Res. Co. vs. New Loveland & Greeley Irr. & L. Co. 40 Colo. 382;
Woods vs. Sargent, 43 Colo. 268;
Colo. Mill & Elev. Co. vs. Larimer & Weld Irr. Co. 26 Colo. 47.

Each junior appropriator has a right to have the conditions on the stream remain as they were when he initiated his appropriation and the senior appropriator, irrespective of the size of his ditch, cannot enlarge his demands upon the stream either in time or quantity to the detriment of a junior.

Vogel vs. Minn. Canal & Res. Co. 47 Colo. 534;
Comstock vs. Ramsey, 55 Colo. 244.

Beneficial use being the basis and extent of the right of the appropriator, irrespective of the size of his ditch or the maximum quantity which his decrees permit him to divert, he cannot divert water from the stream and permit the same to be wasted and his right to divert is necessarily limited to that quantity required to supply his established and present necessities at the particular time the diversion is made and the extent of this necessity determines the quantity which may be diverted. If he attempts to divert more water than his immediate necessities require the water official must cut off his diversion at the source to the extent of the excess diversion.

Wyo. Comp. Stat., 1910, Sec. 741, p. 252; Sec. 802, p. 266;
Farm Inv. Co. vs. Carpenter, 9 Wyo. 110, 125;
Ryan vs. Tutty, 13 Wyo. 130;
X. Y. Irr. D. Co. vs. Buffalo Creek Irr. Co., 25 Colo. 529;
Ft. Lyons Canal Co. vs. Chew, 39 Colo. 392;
Town of Sterling vs. Pawnee Ditch Extension Co., 42 Colo. 421.

All appropriations on every tributary, as well as those from the principal stream, must be considered

in order that the appropriations upon the stream as *a whole* may be so administered as to supply the *needs* of each appropriator and at the same time prevent waste of the valuable natural resource, the water.

Strickler vs. Colorado Springs, 16 Colo. 285.

The above cited statutes of Wyoming provide in part as follows:

> "Rights to the use of water shall be limited and restricted to so much thereof as may be necessarily used for irrigation or other beneficial purposes as aforesaid; irrespective of the carrying capacity of the ditch, and all the balance of the water not so appropriated shall be allowed to run in the natural stream from which such ditch draws its supply of water, and shall not be considered as having been appropriated thereby;
>
> Said water commissioner shall, as near as may be, divide, regulate and control the use of the water of all streams within his district by such closing or partial closing of the headgates as will prevent the waste of water or its use in excess of the volume to which the appropriator is lawfully entitled."

The authorities above cited are to the same effect.

The conditions are further complicated by the rules and laws obtaining in each of the states, wherein the fundamental doctrine of prior appropriation obtains, and *in no two of them are the rights ac-*

quired under the doctrine of the same character or controlled by the same limitations.

For illustration in Colorado the beneficial use of the water is not confined to any specific lands and the appropriator may change the place of application so long as he does not by so doing increase the draft upon the stream either as to the time of the diversion, the duration thereof or the quantity diverted.

Seven Lakes Res. Co. vs. New Loveland & Greeley Irr. & L. Co., 40 Colo. 382;
Diez vs. Hartbauer, 46 Colo. 599;
Ironstone Ditch Co. vs. Ashenfelter, 57 Colo. 31.

In Wyoming, on the other hand the use of the water is limited to a specific tract of land, to which it is made appurtenant and the appropriator is limited to the use of water upon this particular tract, furthermore the maximum amount of the diversion is limited to 1 cubic foot of water per second of time to 70 acres of land.

Wyoming Comp. Stat. 1910, Sec. 724, p. 247.

The foregoing are but a few of the many limitations that attach to the use of water by canals under the rule of prior appropriation, and in order that the greatest benefit to the state and people may be obtained, and none of this valuable resource may be wasted, an organized policing of the streams is required. Where there is an abundance of water little supervision is required but in regions where the demands are great and the quantity limited the administration of the streams becomes a most complicated and trying problem. Each tributary stream has its water commissioner and many deputies and, in turn,

the various water commissioners of all the tributaries are under the supervision of division chiefs or engineers and these in turn under the direct supervision of a State Engineer, who is the chief police officer of the state. The purpose of these various officials and the extent of their respective jurisdictions, varies with the laws of each state according to the local conditions and necessities of the people.

The difficulties presented by the different degrees of vigilance upon the part of the officers and the different methods obtaining within different jurisdictions, may well be illustrated by the prevention of waste in the Cache la Poudre valley in Colorado (where water is scarce and valuable) and the indifference to enormous waste on the Laramie Plains in Wyoming (where water is over abundant and of less value).

(a-1) Waste of Water—Conflict of Administration.

We have observed that both in Wyoming and Colorado waste of water is forbidden. The need of the appropriator determines the extent of his right and, if he has no actual need, the water must not be diverted no matter what the capacity of his ditch or the amount of his decree. Mere subterfuge or pretext for use do not take the place of actual need and the appropriator is limited to his actual necessities and the use of water without waste.

When we speak of "waste", we refer to the unnecessary loss of water and not to the loss always incident to proper diversion and storage. Loss of water by seepage and evaporation in canals when in use to supply the actual needs of the farmer and from reservoirs during the periods of storage, is an incidental and unavoidable loss, which is not "waste"

within the meaning of the term as we use it. The loss incident to the storage and delivery of water through the inter-watershed storage and diversion system of the Wheatland enterprise in Wyoming would, like the incidental loss on the similar tunnel project in Colorado, be unavoidable and is the same character of unavoidable loss that occurs in all irrigation. The evaporation from the Wheatland Reservoir alone is conceded by Wyoming witnesses to be not less than five (5) ft. in depth each year, but this loss, as well as that occasioned by the use of water-ways and long canals for carriage of water to lands, is no more a waste than is the same character of a loss with the Greeley-Poudre system or any other irrigation system.

Necessity for water is so great in the Cache la Poudre valley that Colorado and her citizens have been compelled at the cost of more than a million dollars to drive the Greeley-Poudre Tunnel, here involved, in order to obtain but a relatively small portion of the water of the Colorado portion of the Laramie and it requires several million dollars more to store and deliver the water. Waste is not tolerated under the Colorado system of administration of priorities and diversion and distribution is under most rigid supervision at all times.

On the other hand methods of administration in Wyoming are directly the reverse. Water has been so abundant in the Laramie river valley that practically no administration has been required. Each appropriator has been permitted to help himself and to use or waste the water according to his personal whims, with the result that enormouns quantities of water are there annually wasted, notwithstanding the claim here made by plaintiff that all waters have been appropriated. So

lax are the methods of administration and so enormous is the unnecessary waste that mere economy in application of water would more than compensate for any possible diminution of the stream by the Colorado tunnel project. (See Marginal pages, printed record, 94, 1110, 1280-4, 1288, 2733-50, 3562-76.)

The lax methods of distribution, and the failure of canal owners to so construct their canals that they may divert water from the river in low stages are well stated by Mr. Grant, Wyoming water commissioner for the Laramie river during the dry year, 1913, on marginal pages 1276-89 inclusive of the printed abstract of record.

In part he said:

"Most of the ditches on the big Laramie river are what you might call two-story ditches; that is they were above the bottom of the creek so they would have to have a dam to divert at low stages. At high water they got all the water they needed.

* * * * * * * * *

There were a number of what I called two-story ditches. The average ditch does not cut the bottom of the river. A great many of the ditches are two-story. With a two-story ditch the irrigator obtains all the water he wants when the river is high, but at low stages it requires a dam. At such times the user goes to the head and throws some obstruction in the stream to suit his desires. The change of elevation of water of course makes a change of intake capacity in these two-story ditches. *The irrigators settled their questions themselves;* they

probably would be disgruntled, but didn't bring complaints to my office. From the conditions I noted there on the channel of the river, it looked to me that the same conditions prevailed as they had in the past. (1282-4)

On both the Big and the Little Laramie rivers it is practically physically impossible for any water commissioner to properly apportion the waters with the appliances that exist at the present time. The Little Laramie is better as to headgates than the Big Laramie. *Everything is so crude on both rivers that an apportionment acording to the legal rights of the parties is practically out of the question,* unless one has a current meter to measure it, and then it is a matter of a good deal of labor to try to regulate the water. Each rating consumes considerable time and expense. So that, for the *orderly administration* of that water supply the conditions are not there. * * * The Big Laramie is passing through the same history that all streams have passed through until a certain pressure is brought to bear on them, when they have to put in certain devices to regulate the water." (1288-89.)

Engineer Woodhall on marginal pages 2733-51 describes the conditions prevailing upon the Laramie Plains as compared with those obtaining in the Poudre valley. He describes in detail the enormous and unnecessary waste of water obtaining on the Laramie Plains during the dry season of 1913. He recites the deliberate diversion by large canals of great quantities of water on mere pretext for use

and subsequent discharge thereof into great evaporation basins, where there was no return to any stream. (2741-3.) In December, 1913, two large canals of the Little Laramie river, under pretext of domestic use for watering a few head of stock, were diverting to three-fourths their capacity and discharging the water into Big Basin, a waste lake some 75 feet lower than the river, there to remain until evaporated (2741). He also described a similar condition under the Big Laramie canals, including the Pioneer canal and the recently constructed Lake Hattie Reservoir system (2743-50).

So abundant has been the suply of water from the Laramie River that it has become the custom of the residents of the Laramie Plains to run water in their ditches indefinitely under pretext of supplying water to live stock notwithstanding the enormous and unnecessary waste. This is well illustrated by the case of the Pioneer Canal (the large canal on the Big Laramie River heading not far below the interstate line). Mr. E. D. Titus had been superintendent of the canal for 15 years (858). By July 15 all necessity for irrigation under the canal ceases (866). The area under the canal is well supplied with wells (867) and is a region of lakes and ponds formed by unnecessary waste of water. Notwithstanding these conditions, it has been the prevailing custom to run from 50 to 60 cubic feet of water continuously from July 15 into December of each year for the sole alleged purpose of supplying drinking water to about 2,000 head of cattle running at large in that vicinity, and possibly (but not probably) a few of the 250 people residing under the canal. Mr. Titus states:

> "They keep water running on the meadows from the time I turn it on until they shut it off. After that I do not run a large

head of water, because there is no demand, but *I keep running water into December* for domestic and stock use. * * * * *

After they have ceased irrigating I would run as low as 50 second feet or 60, enough to carry through to the lower end—for watering these cattle and people. Very little water went back to the river or into the numerous lakes. * * * *The people and stock and seepage and evaporation consumed this 50 second feet running constantly.*" (867-8)

(Note: This reference erroneously given as at p. 967, Vol. II., p. 196, orig. brief.)

Computation reveals:—One cubic foot per second delivers 2 acre feet every 24 hours; 50 cubic feet per second equals 100 acre feet per day, which, running for 150 days, would make a total of 15,000 acre feet of water needlessly diverted by the Pioneer Canal each year under pretext of furnishing drinking water for a few people and cattle in a region already filled with wells, lakes and ponds.

John E. Field, former state engineer of Colorado, and an expert of national repute, describes the lack of administration on the Laramie River in Wyoming on marginal pages 3562-76 of the record and also compares the conditions in that region with those of the Cache la Poudre valley. He attributes the enormous waste in Wyoming region to the great abundance of water, no actual shortage ever having been felt, and the custom prevailing of each appropriator helping himself irrespective of his needs (94, 1110), without necessity of supervision or of attempt to control the diversions. By way of illustration he computed the loss by mere evaporation from the un-

necessary waste lakes and ponds on the Laramie Plains into which water is permitted to discharge never again to be used, and concludes by saying:

> "Unnecessay loss fom evaporation on the Laramie Plains is equal to or greater than the proposed diversion of the Greeley-Poudre Irrigation District from the Laramie River. This proposed diversion, under the present construction, I stated to be about 56,000 acre feet per annum in normal years. 60,000 acre feet per annum are calculated to be the unnecessary loss and waste of water by methods employed on the Laramie Plains. (3575)
>
> If Wyoming appropriators would eliminate the unnecessary waste on the Laramie Plains region alone, it would result in a saving of more than enough water to supply the entire diversions of the Greeley-Poudre system from the Laramie River." (3576)

The foregoing quotations, of the many available in the record, will serve to illustrate the conditions that confront the one item of unnecessary waste included within the general administration of diversion and distribution of water by priority of appropriation irrespective of state lines. Wyoming here asserts that she has made prior appropriation of all the waters of the Laramie River, including those which rise in Colorado, and in her supplemental brief tabulates the canals and reservoirs by means of which she contends she made appropriation prior to the initiation of the Greeley-Poudre project (August 25, 1902). Wyoming, however, has made no attempt to regulate and administer the diversions made by

her canals and has made no effort to curtail unnecessary waste. She insists that conditions shall continue upon that river as they have in the past, if this were not so, no claim would here be made that all the waters are necessary to supply the demands of her alleged prior canals for, as we have observed, elimination of unnecessary waste would more than compensate for any depletion of the river by reason of the Colorado tunnel diversion. In other words, she insists that she be permitted to continue to both waste and use; that she has a prior right so to do, and that Colorado shall be prohibited from diverting any water for the imperative necessities of her people, which diversion may interfere with accustomed waste and use of the waters of the stream by Wyoming.

Administration of diversions of water under the rule of priority of appropriation, irrespective of state lines, would be confronted at the outset with the foregoing conditions. And the question of the means or method by which this problem could be solved naturally presents itself. Wyoming would doubtless insist, as she does here, that her appropriators would have a right to continue to both waste and use in the future as in the past, while Colorado would insist that she had a right to divert irrespective of the claims of Wyoming.

We do not venture to speculate upon the means or method by which this controversy could be determined and thereafter regulated. Neither state would have any right beyond its own borders, and its laws or the decisions of its court would have no extra-territorial force or effect. Both states deny foreign servitudes, and there could be no assumption of reciprocal easements. The conflict would be irreconcilable. If Wyoming were adjudged the right to continue in the future as in the past (and such is her

assertion) then acres of thirsty land in Colorado would remain unproductive. The one state, like the prodigal son, would waste the common asset in riotous living and extravagance, while the other member of the family of states would go in want. Yet who in such a case would be the final judge and who would enforce the final order?

(a-2)Enlarged Demand to Junior's Detriment.

The conflict of administration is further illustrated by enlarged demands upon the stream by a senior appropriator to the detriment of a junior. As above noted, the appropriator is limited by his actual needs and the previous use of the water to supply those needs, irrespective of the size of his canal or the amount of his decree, both of which but fix the maximum to which his diversion may go in any event, and further, that he may not enlarge his demands upon the stream, under pretext of his prior appropriation, either in time or quantity, to the detriment of a junior, who is entitled to have the conditions upon the stream remain as they were when his right was initiated. If the senior is permitted to change these conditions by diverting a larger quantity of water or for a longer period of time than he had theretofore, the supply of the stream is cut off from the junior to the extent of the enlarged draft. Such problems constantly confront the state administration of priorities.

Perhaps no better illustration of such an enlarged demand could be found than that asserted, with some semblance of seriousness, by Wyoming in this case. According to plaintiff's Exhibit N, the decree of adjudication upon the Laramie River, and the tabulation appearing in plaintiff's supplemental

brief, pp. 24-5, the Pioneer Canal, diverting water from the Big Laramie River not far below the intertate line, was decreed appropriations as of 1879 and 1884, respectively. By the terms of the decree (Ex. N), the canal was awarded appropriation for 49,030 acres of land, although the evidence showed that never more than 15,000 acres had been irrigated, and in 1913 the canal was serving about 11,556 acres (824, 844 plaintiff's supp. brief, p. 20). Promoters entered the Wyoming area in the spring of 1908 and thereafter initiated and constructed the new Lake Hattie enterprise and enlarged the upper portion of the old Pioneer Canal for joint use by the new enterprise (see pp. 202-221, Vol. II, def. orig. brief and tables). In 1912 the then owners of the new Lake Hattie system, finding themselves with a large reservoir on their hands but with limited lands capable of service, conceived the idea of in effect taking the waters of that lake to the higher levels by a system of exchange by which they would discharge into the river below the reservoir an amount of water equivalent to that which they would take directly from the stream by means of the higher line of canal in contemplation. They accordingly caused a survey to be made and on July 11, 1912, made filing for which permit No. 2719 enl. was granted on July 3, 1913, permitting the exchange of water, but specifically providing that no additional draft should be made upon the stream than that authorized by previous permit 8612, filed April 21, 1908, by the same appropriators. (See cert. copy of permit, def. Ex. No. 160.)

Notwithstanding the above facts the State of Wyoming sought to cloud the situation in this case by attempting to show some possible, though not actual, connecton between this new survey line of 1912 and the old Pioneer Canal, and also certain dis-

connected "fly line" surveys that had been run within a general vicinity, covering an area of 25 miles, by independent engineers in the years previous and thereby evidently intended to leave the impression that the new Pioneer High Line, if ever built, would be entitled to demand water from the stream as of the date of the original Pioneer Canal.

We discussed this situation in Vol. II of defendants' original brief, pp. 234-53, wherein the survey line is designated the "Mythical Pioneer High Line Canal," by reason of the fact that to this day the whole project has never progressed beyond a mere survey line followed by a permit issued in 1913. On pages 37-9 of plaintiff's supp. brief this mere survey line is still treated as a possible claim under color of the original appropriation of the Pioneer Canal, thereby to cloud the intervening claim of the Greeley-Poudre system of Colorado, initiated August 25, 1902. In other words, in effect the plaintiff would leave the impression that it was entitled to claim an enlarged draft upon the river by virtue of the Lake Hattie system and this survey line to the depletion of the stream and the detriment of the junior.

Let us assume for purpose of argument that the Wyoming authorities should hereafter permit the new Lake Hattie system, initiated in 1908, and the Pioneer High Line Canal survey, initiated in 1912, to claim and divert water from the Laramie River under color of the original Pioneer appropriations of 1879 and 1884, while, on the other hand, Colorado and her citizens should insist upon the right to divert water from the upper branches of the stream in that state by the tunnel system, under priority of August 25, 1902, as determined and fixed by her District Court (plff's. Ex. No. 179). An irreconcilable conflict would at once arise, and while it is the unques-

tioned rule that a senior cannot lawfully enlarge his demand upon the stream either in time or quantity to the detriment of a junior, nevertheless such would be the situation, and, while in this instance the geographical position of the junior upon the stream would permit it to take the water and defy the senior in its enlarged demands, yet in the final end the problem would have to be met and solved by some one. The power of neither state would extend beyond its borders, no state official would have authority to adjust the controversy, and the Constitution neither directly nor by implication grants any such authority to Congress. How or by whom the controversy would be settled and the order enforced would be an open question. If necessity should require this Court to settle such a controversy then it would be made the tribunal for the settlement of all controversies between individual appropriators wherever occurring and the burden heretofore borne by the courts of the several states would be transferred *en masse*. It is very evident that the state courts, understanding as they do the local conditions and necessities, are in a better position to adjust the conflict between individual appropriators than would any other courts of the land. But if priorities must obtain irrespective of state lines, then the local courts would be shorn of their jurisdiction and some other court or tribunal would of necessity assume the task.

(b) Appropriation by Reservoirs—Exchanges.

Thus far we have considered but the most elementary principles governing the simpler diversions by ditches. When, however, the use of water, diverted from the river and temporarily stored on its way to the land, enters the problem, the administra-

tion becomes doubly complicated and immediately there occurs what is termed an "exchange" system whereby a junior reservoir may turn a definite quantity of water into the stream above the headgate of some lower but senior appropriator and take in return an equivalent amount from the stream through some higher but junior ditch controlled by the reservoir people, thereby compensating for the depletion of the stream by the junior. This in turn, repeats itself and intermediate loans and exchanges are so made that frequently the most junior but upper ditch upon the stream is taking the water of the most senior but lowest ditch, and yet, in turn, the quantity of water which the junior turns from its reservoir to compensate for the depletion is re-loaned and exchanged several times in such a manner that finally the depletion is compensated by still other reservoirs which have taken the water delivered to the stream for the first exchange. Under this system, necessary to obtain the greatest beneficial use from the water, a complicated system of accounting is necessary and the office of the water commissioner comes to be sort of clearing house for the stream, debiting and crediting as each exchange occurs, and each of the water commissioner districts in turn is compelled to carry on its system of diversions and exchanges in such a manner as not to infringe upon appropriations lower down along the principal stream or upon any of its tributaries which may be affected.

These systems of administration are the natural development of half a century of legislation and administrative experience and vary not only in each state, but even to some degree in the districts within the states, according to the natural conditions obtaining and the necessities of the people. Each pressing necessity demands still more complicated adminis-

tration and the present system is but the beginning of what is yet to come.

This more perfect development demands the most exacting local administration, always open to immediate regulation by local courts, by officials not alone familiar with the conditions and necessities of the community, but as well responsive to the people and the state, and not to some distant authority unfamiliar with local conditions and unable to afford such immediate relief or correction as may be required in order to obtain the maximum benefits from the use of the water in the production of crops.

If such exchanges were undertaken upon an interstate scale, this efficiency would not only be reduced by the complications that must inevitably arise and must then be settled by more remote authority, but even more, the problem would be, by what authority? The administration would, at best, require as great a force of local supervisory officials in all parts of the states through which the stream should pass, but how such could be appointed and under whom they should act, and, at the same time, be responsive to constant local judicial control, we are unable to conjecture. Add to this the conflict of state laws and the problem becomes incapable of solution.

(c) Other Considerations—Conclusion.

To continue the discussion of the various limitations of the right of the appropriator and the necessary details of correct administration would occupy many pages of this brief. Sufficient appears, however, for our present purposes.

To clearly understand the inevitable result of the application of priority irrespective of state lines,

in view of what we have just said, the conditions upon the Platte River in Colorado, Wyoming and Nebraska will serve as a good example.

A sketch map of the Platte River appears in the upper left-hand corner of the large map (Ex. 1) attached to the answers of the corporate defendants. The Platte River enters the Missouri at the eastern boundary of Nebraska. Passing up stream through Nebraska, it divides into two branches at the city of North Platte. The north branch (North Platte) continues northwesterly into Wyoming, through that state and thence southerly into North Park, Colorado, where it has its principal source. The south branch (South Platte) continues through western Nebraska and northeastern Colorado to South Park near the center of the state. This south branch receives its waters from many tributary streams from the mountains of Colorado. Included within the drainage area of the north branch is the Laramie River, which has its source partly in Colorado and partly in Wyoming, and thence flows into the north branch at old Ft. Laramie. The diversion here in controversy is from one tributary of the north branch of the river through an intervening divide to a tributary of the south branch of the same stream. The various ditches and reservoirs upon this stream will serve to illustrate the conditions which confront an administration of the waters of a stream and its tributaries, according to the rule of priority of appropriation irrespective of state lines.

Purely by way of illustration and outside the record, we observe that the public records of the State Engineer of Colorado reveal the following number of decreed water rights from the south branch of the Platte in that state:

Decreed Water Rights—South Platte Drainage.

River.	Water District.	Ditches.	Reservoirs.
South Platte	No. 1	221	120
South Platte	No. 2	80	30
South Platte	No. 23	478	18
South Platte	No. 64	64	6
Cache la Poudre	No. 3	110	56
Thompson	No. 4	81	18
St. Vrain	No. 5	173	55
Boulder	No. 6	122	34
Clear Creek	No. 7	105	24
Plum Creek	No. 8	210	25
Bear Creek	No. 9	31	9
Total		1,675	325

The same records reveal the following number of decreed water rights within the north branch of the Platte in that state:

Decreed Water Rights—North Platte River Drainage.

River.	Water District.	Ditches.	Reservoirs.
North Platte	No. 46	177	2
North Platte	No. 47	388	2
Laramie	No. 48	90	19
Total		655	23

From the foregoing tables it appears that there are 2,330 decreed ditches and 348 decreed reservoirs from the Platte River (both branches) in Colorado.

The public records of the State Engineer of that state further reveal that there are claims for incomplete appropriations in excess of those already decreed, but consideration of these is unnecessary for the purposes of this illustration.

It is safe to assume that the decreed rights from the North Platte branch in Wyoming are far in excess, numerically, of those in Colorado. Plaintiffs' Exhibit N (a compilation of the decreed rights on the Laramie River in Wyoming) reveals 483 decreed rights upon the Laramie River and tributaries in that State and, for purpose of illustration, we feel warranted in saying that probably not less than 1,000 ditches and reservoirs have been decreed from the North Platte and tributaries in Wyoming. The evidence in this case shows that several large enterprises dating not earlier than 1908-9 have been completed or are in the process of construction within the Laramie River branch and the published reports of the office of the State Engineer of Wyoming likewise show that hundreds of permits have been issued for projects in the North Platte drainage not yet decreed. We shall pass these undecreed appropriations in the same manner we have those in Colorado.

The published reports of the office of the state engineer of Nebraska show a large number of decreed reservoirs and ditches within the Platte River drainage (both branches) in that state and we feel warranted in assuming that not less than 300 diversions, large and small, are there decreed.

The sum total of the foregoing figures reveals that administration under the rule of priority, irrespective of state lines, would require readjudication

and police regulation of upwards of 4,000 diversions already established and decreed by state authorities upon the Platte River alone and, in the years to come, probably a like number of new and now more or less incomplete enterprises.

In view of the fact that the right of the appropriator is not defined by the capacity of his ditch or the maximum amount awarded him in his decree but is limited to his actual necessities during each day of the year and that his diversions must constantly be regulated and restricted to the extent of his then present necessities, and further in view of the complicated conditions arising from exchanges and other administrative features existing upon each of the tributaries as well as upon the stream itself, it is self-evident that the difficulties confronting interstate administration of the Platte River would become so involved that to give each appropriator his just dues and no more and at the particular time his necessities demand, would be next to impossible. If such should be declared to be the rule, the rights of all must be protected and enforced, the least must receive the same consideration as the greatest and that too at the particular time when the crop demands water in order that loss may be avoided.

Yet no state official has power to control the regulation beyond his own borders or other than as prescribed by local laws, rules and regulations. No state court or tribunal has power to fix by decree rights of appropriation in other states, to adjust conflicting claims, or to determine from day to day the rights of foreign users. The system prevailing in one state is so different from that of a neighboring state that irreconcilable conflict is inevitable. The problem presented under one system of state law is, at best, difficult and involved, but where a conflict of

laws would enter, the problem of administration would be incapable of solution.

In order to take the initial step toward administration of the rule, all of the states would be compelled to repeal their present laws, rules and regulations and to adopt one uniform system *irrespective of local conditions or necessities.* But this may not be done without the voluntary consent of all, neither state may legislate for the other and Congress can legislate for none.

> "Neither state can legislate for or impose its own policy upon the other.
>
> Congress cannot enforce either rule upon any state."
>
> Kansas vs. Colorado, 206 U. S. 46, 94, 95.

If this court should decide that the private usufructuary rights of the individual appropriators preclude the states from asserting greater rights to the river and that priority shall obtain irrespective of state lines, then such rights must be adjudicated by the court in this and similar cases. This would necessitate a determination not of the rights of the states, but of *each individual claimant* and the rights of each, great or small, would have to be separately considered and passed upon. The mere suggestion of the problem portrays the insurmountable obstacles to be encountered.

The decrees of the state courts bind only those within their jurisdiction.

> Pennoyer vs. Neff, 95 U. S. 714.
> (See supra, p. 257 to 262).

We refuse to recognize Wyoming decrees and they ours.

What court, other than this, could enter upon such an adjudication?

Even should this court undertake this individual adjudication, its enforcement would next confront us. Shall an army of United States marshals police the stream and regulate the diversions? No state officials have power to enforce other than the laws and decrees of their own state.

Then too, conditions are constantly changing. New rules and laws of one character may become imperative in Colorado but Nebraska or Wyoming need new laws entirely the reverse of those required in Colorado. Who then shall enact these laws? The subject is no longer within the control of the states because their juridiction has been denied them. Congress cannot legislate, for it has no power so to do. (206 U. S. 90-92.) The canals divert waters from streams washing lands long sinced passed into private hands and not public lands of the United States. This court cannot legislate. Who then shall remedy the evil or supply the new rule? The United States asserted the right so to do but this court declared the contrary. (206 U. S. 85-93)

Further pursuit of this line would be but to multiply indefinitely the examples of questions such a rule of law would provoke and but further reveal the conflict of jurisdiction. Problems unheard of today will clamor for recognition and solution on the morrow. But fifty years ago Colorado was an arid waste. Today more than 3,000,000 acres of land are productive to an intensive degree, through irrigation fostered, protected, encouraged and regulated by the state. What another fifty years will bring we can but conjecture. Very evidently, in the language of Mr. Justice Field:

"It is, therefore, a matter of good sense and practical wisdom to leave their control and management with the states."

Escanaba Co. vs. Chicago, 107 U. S. 678, 688.

(5) Prior Appropriations Restricted by State Lines.

Without reviewing the preceding pages and the various subdivisions of the discussion of both the law and administration of the general principles of the prior appropriation, we conclude: That the doctrine of prior appropriation is one of private usufructuary property law *intra-state* in its character, varying in each of the states where adopted according to the local conditions and necessities and exactly alike in no two thereof; that it is inequitable and inapplicable either as a rule of law or administration for *interstate* regulation of streams, and that the general principles of appropriation cannot apply in the settlement of controversies involving the rights of sovereign states.

VII.—BY WHAT PRINCIPLES THE CASE IS TO BE CONTROLLED.

In the previous pages we have discussed at length that part of the first subdivision of the order for reargument which reads:

"whether the rights asserted are to be tested and determined solely by the application of the general principles of prior appropriation, without regard to state boundaries, or whether, on the contrary, the general principles of prior appropriation are subject to be restricted or their operation limited in this case by state lines,"

and have there observed that the general principles of prior appropriation are but rules of private property law for *intra-state* regulation and control of the uses of waters of streams, to be restricted and their operation limited by state lines and that the general principles of appropriation cannot apply to the settlement of controversies involving the rights of states.

Having arrived at the conclusion that "the general principles of prior appropriation are to be restricted or their operation limited in this case by state lines" we are now directed by the order to state "by what principles, under that assumption, the case is to be controlled."

In the opening pages of this brief we observed that this original proceeding is between two states of the Union each asserting sovereign rights, that the rights of the private citizens or appropriators of either of the states are included within the greater right of the state and that if the case against Colorado fails it fails also as against the corporate defendants.

The controversy is one between two sovereign states and rises therefore above a mere suit to determine the rights of the individual appropriators within each of the states; the action complained of is state action and the principles of law which apply between states are not those which would be applied between individuals.

Missouri vs. Illinois, 180 U. S. 208, 242, 200 U. S. 496.

Kansas vs. Colorado, 185 U. S. 125, 206 U. S. 46.

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258.

Bean vs. Morris, 221 U. S. 485.
Georgia vs. Tennessee Copper Co., 206 U. S. 230.

As observed by Mr. Justice Brewer in *Kansas vs. Colorado, supra*:

> "It is the State of Kansas which invokes the action of this court, charging that through the action of Colorado a large portion of its territory is threatened with disaster. In this respect it is in no manner evading the provisions of the Eleventh Amendment to the Federal Constitution. *It is not acting directly and solely for the benefit of any individual citizen to protect his riparian rights.* Beyond its property rights it has an interest as a state in this large tract of land bordering on the Arkansas river. Its prosperity affects the general welfare of the state. *The controversy rises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint. Georgia vs. Tennessee Copper Co.*, decided this day, *post*, p. 230." (206 U. S. 99.)

It is well to observe at the outset that the rule of interstate servitudes or easements cannot here apply. Neither state recognizes and on the contrary repudiates any such, whether asserted under the private usufructuary doctrine of appropriation, or otherwise. Such extra-territorial easements or servitudes are thus referred to in the cases:

> "But it does not follow that every matter which would warrant a resort to equity by one citizen against another in the same

jurisdiction equally would warrant an interference by this court with the action of a state. It hardly can be that we should be justified in declaring statutes ordaining such action void in every instance where the Circuit Court might intervene in a private suit, upon no other ground than analogy to some selected system of municipal law, and the fact that we have jurisdiction over controversies between states.

The nearest analogy would be found in those cases in which an easement has been declared in favor of land in one state over land in another. But there the right is recognized on the assumption of a concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted. *Manville Co. vs. Worcester*, 138 Massachusetts, 89. *But when the state itself is concerned and by its legislation expressly repudiates the right set up*, an entirely different question is presented."

Missouri vs. Illinois, 200 U. S. 496, 521.

"When a right is asserted in favor of land in one jurisdiction over land in another, different principles are involved from those that suffice when both parcels are subject to the same law. When such rights have been recognized it has been on the ground of an assumed concurrence between the two states, the one, so to speak, offering the right, the other permitting it to be accepted. *Manville Co. vs. Worcester*, 138 Massachusetts, 89. *Missouri vs. Illinois* 200 U. S. 496, 521. But still there are two parcels of land subject to different systems

of law; and although the rights and liabilities in respect of each may require a consideration of the other if they are to be dealt with completely, the fact remains that each may be regulated by the state where the land lies *according to its sovereign will. Kansas vs. Colorado*, 206 U. S. 46, 93."

Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 258, 260.

"* * * we pass at once to the question of *private* water rights as between users in different states.

We know no reason to doubt, and we assume, that, subject to such rights as the lower state might be denied by this court to have, and to vested private rights, if any, protected by the Constitution, the state of Montana has full legislative power over Sage Creek while it flows within that state. *Kansas vs. Colorado*, 206 U. S. 46, 93-95. Therefore, subject to the same qualifications, we assume that the concurrence of the laws of Montana with those of Wyoming is necessary to create easements, or such private rights and obligations as are in dispute, across their common boundary line. *Missouri vs. Illinois*, 200 U. S. 496, 521. *Rickey Land & Cattle Co. vs. Miller & Lux*, 218 U. S. 258, 260. But with regard to such rights as came into question in the older states, we believe that it always was assumed, *in the absence of legislation* to the contrary, that the states were willing to ignore boundaries, and allowed the same rights to be acquired from outside the state

that could be acquired from within. *Manville vs. Worcester,* 138 Mass. 89 (and other cases)."

Bean vs. Morris, 221 U. S. 485, 486.

The same general qualification appears within each of the foregoing. In *Missouri vs. Illinois*:

"But when the state itself is concerned and by its legislation expressly repudiates right set up, an *entirely different* question is presented." (200 U. S. 521).

In *Rickey Land & Cattle Co. vs. Miller & Lux*:

"Each may be regulated by the state where the land lies according to its sovereign will. (p. 260)

But whatever this court may decide, *if a private owner should derive advantage from such a decision it would not be in his own right, but by reason of and subordinate to the rights of his state,* and those rights, the petitioner insists, can, or at least should be, determined only in a suit brought by the state itself." (p. 261.)

And in *Bean vs. Morris*:

"We believe that it was always assumed *in absence of legislation to the contrary,* that the states were willing to ignore boundaries, etc." (p. 487)

Here, however, "the state itself is concerned and by its legislation expressly repudiates the right set up" and Colorado repudiates the right as well by her answer herein as by her constitution, laws and the decisions of her courts and "an entirely different question is presented" Colorado asserting that the

part of her domain "may be regulated by the state where the land lays according to its sovereign will," and there is no "absence of legislation to the contrary."

As stated by Mr. Justice Campbell:

> "The state has never relinquished its right of ownership and claim to the waters of our natural streams, though it has granted to its citizens, upon prescribed conditions, the right to the use of such waters for beneficial purposes and within its own boundaries. The property right, however, in the natural streams, and the waters flowing therein, has never been renounced or relinquished by the state, and it has at all times asserted not only its right of ownership, but the unrestrained right, within its own boundaries, to distribute its waters to those who have, under its authority, acquired, by perfected appropriations, the right to their use.
>
> This constitution of ours was ratified and adopted by the legal voters of the state in accordance with the conditions prescribed by the enabling act of congress, and the president of the United States in his proclamation admitting Colorado into the Union found the fact to be that the fundamental conditions imposed by congress on the State of Colorado to entitle it to such admission had been complied with. Congress, in passing the enabling act, and the President, in issuing his proclamation, were aware of the existing physical conditions and of the topography and geography of the state. The federal government, by its lawmaking and

executive bodies, knew that the natural streams of this state are, in fact, non-navigable within its territorial limits, and practically all of them have their sources within its own boundaries, and that no stream of any importance whose source is without those boundaries, flows into or through this state. The entire volume of these streams is therefore made up of rains and snows that fall upon the surface of lands included within the exterior lines of this state and of springs which issue from the earth within the same area. Such being the peculiar conditions, the state was justified in asserting its ownership of all the natural streams within its boundaries. When Colorado was admitted into the Union with such a constitution, the federal government, through its lawmaking and executive departments, thereby recognized and confirmed such right of ownership as belonging to the state in its sovereign capacity. We therefore find it to be not only that our state constitution and pertinent statutes, but the decisions of the courts and duly announced public policy, all are in accord on the proposition to which the federal government has, as we have just shown, given its consent that the waters of the natural streams of this state belong to the people, to the state, in its sovereign capacity, *and that its right to their distribution and control within its borders is free from any interference by any other sovereignty.*

There is nothing in Lamson vs. Vailes, 27 Colo. 201, 61 Pac. 231, at all inconsistent

with this conclusion. In that case this court declined to pass on the question which is involved in the pending action, because it was not necessary to the decision of that controversy. This court, by then withholding expression of opinion, did not intend to intimate, and did not intimate, that this state did not have full control over its natural streams and the distribution of their waters. The right of congress to regulate and control navigable interstate streams and the jurisdiction of the Supreme Court of the United States to determine, in a controversy between two or more sovereign states over the waters of an interstate stream, whether they are reasonably exercising their inherent powers of sovereignty, are not overlooked or questioned by us; but these considerations do not, for the reasons above stated, affect or bear upon the right of ownership and control by Colorado of its own natural streams, and its power and authority to regulate the distribution of their waters, within its own territory, for beneficial purposes. We find nothing in *United States v. Rio Grande Irrigation Co.*, 174 U. S. 690, 19 Sup. Ct. 770, 43 L. Ed. 1136; *Kansas v. Colorado*, 206 U. S. 46, 27 Sup Ct. 655, 51 L. Ed. 956; *Rickey L. & C. Co. v. Miller & Lux*, 218 U. S. 258, 31 Sup. Ct. 11, 54 L. Ed. 1032; *Bean v. Morris*, 221 U. S. 485, 31 Sup. Ct. 703, 55 L. Ed. 821, or in any other case that has been brought to our attention, which militates against our conclusion, when these cases are considered, as they should

be, in connection with the facts on which they were determined. We therefore conclude that the general assembly, in order to protect the rights of the state in our natural streams and their waters, and the interests which its citizens have acquired thereunder, may make a valid appropriation of money for the purpose of protecting and defending them."

Stockman v. Leddy, 55 Colo. 24, 28.

Colorado has by statute affirmed the doctrine steadfastly adhered to by her from the date of her admission, repudiating any and all claims of other states to her waters or any portion thereof.

See S. L. Colo. 1917, Chap. 151, p. 539.

Wyoming likewise has denied and repudiated the doctrine of servitudes or easements across her borders.

Grover Irr. Co. v. Lovella D. Co., 21 Wyo. 204 (see quotation *supra*).

Servitudes or easements across the interstate boundary between the two states, whether under color of the doctrine of priority of appropriation or otherwise, are therefore requdiated by both states, and further discussion of any such doctrine is unnecessary.

The settlement of controversies over the waters of international rivers is usually regarded as one of policy to be adjusted by treaty.

Opinions of Attorneys General, Vol. XXI, 274, 283.

Kansas v. Colorado, 185 U. S. 125,.140, 144.

Kinney on Irrigation & Water Rights (2d Ed.), Vol. 3, p. 2195.

And while the several states of the Union have, by the first clause of Section 10, Article I of the

Constitution, surrendered their powers to enter into any treaty alliance or confederation, by paragraph 2 of the same section they have reserved the right, by "consent of congress," to "enter into any agreement or compact with any other state".

Section 10, Article I, Constitution of United States.

By the foregoing section it is apparent that the states still have the power, consent of congress having been obtained, to adjust their interstate controversies over rivers by "agreement or compact."

Missouri vs. Illinois, 180 U. S. 208, 238.
200 U. S. 496, 518.
Kansas vs. Colorado, 185 U. S. 125, 140.

Mr. Wiel asserts that such will be the ultimate solution of interstate controversies over streams, saying:

> "Between states, each is entitled to have for its prosperity an equitable apportionment of benefits from an interstate stream. Consequently, control of interstate streams is likely to gravitate toward the formation of joint commissions between the states to supervise their use and make regulations."

Wiel on Water Rights, (3rd Ed.) Vol. 1, p. 372.

Yet if independent nations fail to adjust their controversies by treaty their differences would be of such a nature as to justify a settlement by force and the same methods of settlement would apply between states of the Union were it not for the surrender of such power in the Constitution.

Missouri vs. Illinois, 180 U. S. 208, 241;
S. C. 200 U. S. 496, 518.
Kansas vs. Colorado, 185 U. S. 125, 143,
S. C. 206 U. S. 46, 95-7-8.

As stated in *Missouri vs. Illinois, supra*:

> "If Missouri were an independent and sovereign state all must admit that she could seek a remedy by negotiation, and, that failing by force." (180 U. S. 241)

By Mr. Justice Brewer in *Kansas vs. Colorado, supra*:

> "The powers affecting the internal forces of the states not granted to the United States by the Constitution, not prohibited by it to the states, are reserved to the states respectively." (206 U. S. 90.)
>
> "If the two states were absolutely independent nations it would be settled by treaty or force, neither of these ways being practicable, it must be settled by decision of this court." (206 U. S. 98).

And as observed by Mr. Justice Holmes in *Missouri vs. Illinois*:

> "The nuisance set forth in the bill was one which would be of international importance—a visible change of a great river from a pure stream into a polluted and poisoned ditch. The only question presented was whether as between the states of the Union this court was competent to deal with a situation which, if it arose between independent sovereignties, might lead to war. Whatever differences of opinion there

might be upon matters of detail, the jurisdiction and authority of this court to deal with such a case as that is not open to doubt." (200 U. S. 518.)

It would thus appear that this controversy over a portion of the waters of one branch of an interstate stream is of equal dignity with a controversy between independent nations, and this court is called upon, in this and similar cases, to decide the controversy on the broader grounds of interstate and international law.

Kansas vs. Colorado, 185 U. S. 125, 146;
Id. 206 U. S. 46, 97.
Missouri vs. Illinois, 200 U. S. 496, 520.

As observed by Mr. Justice Brewer in *Kansas vs. Colorado, supra*:

"Nor is our jurisdiction ousted, even if, because Kansas and Colorado are states sovereign and independent in local matters, the relations between them depend in any respect upon principles of international law. International law is no alien in this tribunal. * * * In other words, through these successive disputes and decisions this court is practically building up what may not improperly be called interstate common law." (206 U. S. 97.)

In controversies involving interstate streams two fundamental principles control.

The *first*:

"Each state has full jurisdiction over the lands within its borders. * * * It may determine for itself whether the common law rule in respect to riparian rights

or that doctrine which obtains in the arid region of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any state."

Kansas vs. Colorado, 206 U. S. 46, 93.

Or, in other words:

"The states have authority to establish for themselves such rules of property as they may deem expedient with respect to the streams of water within their borders, both *navigable and non-navigable.*"

United States vs. Cress, 37 Sup. Ct. Rep. 380, 381.

The *second*:

"One cardinal rule, underlying all the relations of the states to each other is that of *equality of right.* Each state stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none." (206 U. S. 97.)

The controversy should be so settled that the sovereign powers of both states are preserved and at the same time establish justice between them:

"Whenever, as in the case of Missouri vs. Illinois, 180 U. S. 208, the action of one state reaches through the agency of natural laws into the territory of another state, the question of the extent and the limitations of the rights of the two states becomes a matter of justiciable dispute between them, and this court is called upon to settle that dis-

> pute in such a way as will recognize the *equal rights of both* and at the same time establish justice between them." (206 U. S. 98.)

A greater degree of caution is manifest in such controversies than would obtain in suits between citizens within the same or different jurisdictions. And the complaining state should be required to establish the injury and its right to relief upon the clearest and most indisputable testimony before this court would be warranted in preventing the other state from exercising its sovereign control over its natural resources.

In Missouri vs. Illinois, 180 U. S. 208, 248, Mr. Justice Shiras thus announced the degree of proof required before injunction would issue to restrain a nuisance upon an interstate stream:

> "We fully agree with the contention of defendants' counsel that it is settled that an injunction to restrain a nuisance will issue only in cases where the fact of nuisance is made out upon determinate and satisfactory evidence; *that if the evidence be conflicting and the injury doubtful, that conflict and doubt will be a ground for withholding an injunction;* and that, where interposition by injunction is sought, to restrain that which is apprehended will create a nuisance of which its complainant may complain, the proofs must show a state of facts as will manifest the danger to be real and immediate."

And in the same case on final hearing, after proof, Mr. Justice Holmes thus distinguished be-

tween state controversies and those between individuals and announced the greater caution and degree of proof required in the former:

> "It may be imagined that a nuisance might be created by a state upon a navigable river like the Danube, which would amount to a *causus belli* for a state lower down, unless removed. If such a nuisance were created by a state upon the Mississippi the controversy would be resolved by the more peaceful means of a suit in this court. But it does not follow that every matter which would warrant a resort to equity by one citizen against another in the same jurisdiction equally would warrant an interference by this court with the action of a state. It hardly can be that we should be justified in declaring statutes ordaining such action void in every instance where the Circuit Court might intervene in a private suit, upon no other ground than analogy to some selected system of municipal law, and the fact that we have jurisdiction over controversies between states.
>
> * * * * * * * * *
>
> *Before this court ought to intervene the case should be of serious magnitude, clearly and fully proved, and the principle to be applied should be one which the court is prepared deliberately to maintain against all considerations on the other side.* See *Kansas vs. Colorado*, 185 U. S. 125.
>
> As to the principle to be laid down the caution necessary is manifest. * * * To decide the whole matter at one blow by

an irrevocable fiat would be at least premature." (200 U. S. 520.)

In that case this court refused to enjoin Illinois from discharging sewage and other waters into the Mississippi river, where it appeared from the evidence that other cities, including those in Missouri were contributing to the same condition and the proof of the injury was inadequate to justify an injunction.

In the present case we contend that the proof by Wyoming falls so far below the allegations of the bill that it is not brought within the principles governing such controversies. Not only has Wyoming failed to sustain the allegations of the bill, but on the other hand, the evidence shows beyond a contradiction that Wyoming is herself sanctioning and permitting the very acts of which she complains against Colorado. She complains of diversions from the watershed of the river and yet the proof is uncontradicted that such is the prevailing custom under sanction of Wyoming laws and court decrees, not only on the Laramie river, but elsewhere over the state (1503-18) and that Wyoming is in fact diverting water out of the Cache la Poudre watershed into the Laramie drainage while here she complains of the Colorado diversion from the Laramie to the Cache la Poudre (1516-18, 1577, 1595. See also pp. 27-39, Vol II, Def. Original Brief.) She complains that she had appropriated all the waters of the Colorado branch of the Laramie river prior to the time Colorado commenced work on her tunnel diversion system (Aug. 25, 1902) and yet the evidence shows without contradiction that long after the Colorado project was commenced, Wyoming granted permits for numerous and immense projects from the same river, beginning, with one exception, not earlier than

1907 and principally during the years 1908, 1909, 1910 and 1912, and thereby determined, by decisions of her state engineer (Wyoming Comp. St. 1910, Sec. 729, p. 248; also p. 3918 of record); that sufficient water yet remained in the stream to supply the enormous new and far junior projects. (See pages 192, 226, Vol. II, defendant's original brief and tables; see, also, marginal pp. 3916-3933 of record and exhibits). She further asserts that all the waters of the Colorado branch of the stream are required for her prior diversions, while the proof shows that she needlessly annually wastes more water than will be diverted by the Colorado tunnel. (See pp. 299 to 307, this brief.) In short, the proof is not only conflicting, but, on the contrary, conclusive against the allegations of the bill.

Defendants contend that Wyoming has wholly failed to prove the allegations of her bill and that the same should be dismissed.

While we might here conclude the argument, nevertheless, so important is the controversy and so far reaching will be the precedent, that fairness to all concerned demands extended consideration of the great case of *Kansas vs. Colorado, supra.* So far as we are able to ascertain, that was the first and the last controversy between states over the use of interstate streams for irrigation, to have come before this Court, and we are unable, after extended search, to find any record or report of settlement of a similar controversy anywhere on either hemisphere. The equality and dignity of the states and the extent of their jurisdiction over the natural resources and waters within their borders, announced in the decision in that case and in the former case of *Missouri vs. Illinois,* would seem to have determined the fundamental principles of interstate law governing contro-

versies between states of the Union over rivers common to two or more thereof, and to have established the degree of certainty of proof required of a complaining state before her neighboring state may, in justice and recognition of the equal dignity and sovereign rights of both, be restrained in the use of her own territory and resources to the alleged detriment of the complaining state.

Kansas vs. Colorado.

The case of *Kansas vs. Colorado*, involved the Arkansas River, which rises in the mountains of Colorado and flows out across the plains of eastern Colorado, and thence across southwestern Kansas into Oklahoma. The State of Kansas, by leave of court, filed her complaint against the State of Colorado, charging:

> "That the State of Colorado and her citizens acting under her authority, had diverted and were threatening to divert, within the territorial limits of Colorado, the waters of the Arkansas river for the purposes of irrigation, under claim that Colorado, as a sovereign state, was the owner of all the waters within her borders;
>
> That these ditch owners and the State of Colorado are now diverting the waters flowing in the bed of the Arkansas river and its tributaries, and carrying them to great distances from their natural courses, and discharging them for agricultural purposes on 'arid and non-riparian lands,' where such waters are *wholly lost* to such streams and to the State of Kansas and its inhabitants. That such diversion is carried to

such an extent that no water flows in the bed of said river from the State of Colorado into the State of Kansas during the annual growing season, and the underflow of said river in Kansas is diminishing and continuing to diminish, and if the said diversion continues to increase, the bottom lands of said valley will be injured to an enormous extent, and a large portion thereof will be utterly ruined and will become deserted and be a part of of an arid desert;

That by reason of the prior settlement, occupation and title of the inhabitants of Kansas upon and to the lands situated in the valley of said river, including those upon its banks, Kansas and the owners of land in the valley acquired, and now have the right to the uninterrupted and unimpeded flow of all the waters of the river into and across the State of Kansas; which rights accrued prior to any of the diversions by or in Colorado, and prior to the accruing of any rights claimed by that state, or by persons, firms or corporations therein now taking water from the river or its tributaries."

After setting forth the damage to the State of Kansas, by the Colorado diversions, the complainant prayed that the State of Colorado and her citizens be enjoined from diverting the water of the river. (185 U. S. 133, 135, 137.)

To this bill the State of Colorado demurred upon several grounds, among them, because the constitution of the State of Colorado, declaring public property in the waters of its natural streams and sanctioning the right of appropriation, was enacted pur-

suant to national authority and ratified thereby at the time of the admission of the state into the Union. (185 U. S. 138-139.)

In the opinion by Mr. Chief Justice Fuller, the court considered the extreme contentions of the two states, that is, the contention of Kansas that, as a lower riparian owner prior in point of development to Colorado, she had the right to the full and unimpeded flow of the river without diversion by the State of Colorado, and the contention of Colorado, that as a sovereign and independent state, she is justified, if her geographical situation and material welfare demand it, in her judgment, in consuming for beneficial purposes all the waters within her boundaries; and held, inasmuch as the two states could not, under the Constitution of the United States, enter into a treaty nor resort to war with one another, as they might if each were an independent nation, that the controversy between them was justifiable. The demurrer was overruled without prejudice, the court saying (page 147):

> "We think proof should be made as to whether Colorado is herself actually threatening to wholly exhaust the flow of the Arkansas River in Kansas; whether what is described in the bill as the 'underflow' is a subterranean stream flowing in a known and defined channel, and not merely water percolating through the strata below; whether certain persons, firms, and corporations in Colorado must be made parties hereto; what lands in Kansas are actually situated on the banks of the river, and what, either in Colorado or Kansas, are absolutely dependent on water therefrom; the extent of the water-

> shed or the drainage area of the Arkansas River; the possibilities of the maintenance of a sustained flow through the control of flood waters; in short, the circumstances, a variation in which might induce the court to either grant, modify, or deny the relief sought or any part thereof."

Thereafter, Kansas amended her bill by making certain corporations and individuals in Colorado parties defendant, and the Government, through the Solicitor General, intervened on behalf of the United States Reclamation Service, admitting that the court had jurisdiction of the controversy; that navigation was not affected by the diversions in Colorado, and also that the common law of riparian rights never applied within the territorial limits of the State of Colorado, but taking a position antagonistic to both the original parties to the suit, contending, among other things (Vol. 206, page 66), that water flowing in interstate streams was the subject of interstate commerce, and therefore within the jurisdiction of the federal government, or the alternative, that, inasmuch as a conflict between the two sovereign states was involved, there was in the United States an inherent power of sovereignty giving it jurisdiction over the waters of interstate streams; that inasmuch as there were vast bodies of land included within the public domain, the irrigation of which could be more readily accomplished by the Reclamation Service, acting under the authority of the Reclamation Act, June 17, 1902, 32 Stats. 388, therefore: "the decree should embrace, in terms or in effect, a recognition of the national law and of the government's right to direct the matter of water distribution on this non-navigable interstate stream"; and that the doctrine

of riparian rights was unsuited to national control of irrigation from interstate streams, and the doctrine of prior appropriation should be adopted as the plan of national administration.

The State of Colorado, by answer, denied that her diversions of water from the stream had worked any injury to Kansas or her citizens and denied the right of Kansas to insist upon the undiminished flow of the stream; that the Arkansas river, rising in the mountains of Colorado and flowing out across her plains to Kansas, was one of the natural resources of the State of Colorado, and that as a sovereign state she had the right to divert the waters of the stream and use the same for the necessary reclamation of the arid lands within her borders; that her rights as a state of the Union were in all respects equal with those of the State of Kansas, and that as a sovereign state she had the right to divert and use the waters within her territory under such rules and laws as were best adapted to the necessities of the state and her citizens.

In short, three general contentions were made:

Kansas asserted the doctrine of riparian rights with some limited right of irrigation, and insisted that the river should flow undiminished from Colorado;

Colorado asserted her right to use the waters of the river as a natural resource rising within her borders, for the reclamation of her arid lands under her local rules of priority of appropriation;

The United States asserted superior authority and control of the interstate stream, under a general plan of national reclamation.

Upon final hearing the claims of national control by the United States were denied and the full

jurisdiction of each state over the lands, streams and waters within its borders was affirmed, and while the appropriation of waters by Colorado for irrigation was found to have diminished the flow of the river into Kansas and to have worked perceptible injury to portions of the Arkansas valley in Kansas, the bill of the State of Kansas was dismissed without prejudice to her right to institute new proceedings whenever it should appear that a material increase in the depletion of the waters of the Arkansas by Colorado should be injuring the substantial interests of Kansas to the extent of destroying the equitable apportionment of the benefits between the two states resulting from the flow of the river.

The exhaustive opinion by Mr. Justice Brewer clearly defines the sovereign rights of each of the states; their equal powers as states of the Union and the limitations of the exercise of such powers in their relations to one another, in the use of common streams. After a discussion of authorities and the conclusion that the controversy was one of a justiciable nature, he said:

> "Turning now to the controversy as here presented, it is whether Kansas has a right to the continuous flow of the waters of the Arkansas River, as that flow existed before any human interference therewith, or Colorado the right to appropriate the waters of that stream so as to prevent that continuous flow, or that the amount of the flow is subject to the superior authority and supervisory control of the United States. While several of the defendant corporations have answered, it is unnecessary to specially consider their defenses, for if the case against Colorado fails it fails also as against them.

Colorado denies that it is in any substantial manner diminishing the flow of the Arkansas River into Kansas. If that be true, then it is in no way infringing upon the rights of Kansas. And if it is diminishing that flow, has it an absolute right to determine for itself the extent to which it will diminish it, even to the entire appropriation of the water? And if it has not that absolute right is the amount of appropriation that it is now making such an infringement upon the rights of Kansas as to call for judicial interference? Is the question one solely between the States or is the matter subject to national legislative regulation, and, if the latter, to what extent has that regulation been carried? * * *

The primary question is, of course, of national control. For, if the Nation has a right to regulate the flow of the waters, we must inquire what it has done in the way of regulation. If it has done nothing, the further question will then arise, what are the respective rights of the two States in the absence of national regulation?'' (p. 85.)

After noting the power of Congress to regulate commerce among the States and control interstate navigation, but that the United States made no such claim and admitted that the use of waters by Kansas and Colorado in no way affected the navigability of the river, he continued:

''It rests its petition of intervention upon its alleged duty of legislating for the reclamation of arid lands; alleges that in or near the Arkansas River, as it runs

through Kansas and Colorado, are large tracts of those lands; that the National Government is itself the owner of many thousands of acres; that it has the right to make such legislative provision as in its judgment is needful for the reclamation of all these arid lands, and for that purpose to appropriate the accessible waters.

In support of the main proposition it is stated in the brief of its counsel:

'That the doctrine of riparian rights is inapplicable to conditions prevailing in the arid region; that such doctrine, if applicable in said region, would prevent the sale, reclamation, and cultivation of the public arid lands, and defeat the policy of the Government in respect thereto; that the doctrine which is applicable to conditions in said arid region, and which prevails therein, is that the waters of natural streams may be used to irrigate and cultivate arid lands, whether riparian or non-riparian, and that the priority of appropriation of such waters and the application of the same for beneficial purposes establishes a prior and superior right.'

In other words, the determination of the rights of the two States *inter sese* in regard to the flow of waters in the Arkansas River *is subordinate to a superior right on the part of the National Government* to control the whole system of the reclamation of arid lands. That involves the question whether the reclamation of arid lands is one of the powers granted to the General Government.

As heretofore stated, the constant declaration of this Court from the beginning is that this Government is one of enumerated powers. * * *

Turning to the enumeration of the powers granted to Congress by the eighth section of the first article of the Constitution, it is enough to say that no one of them by any implication refers to the reclamation of arid lands. * * *

We must look beyond section 8 for congressional authority over arid lands, and it is said to be found in the second paragraph of section 3 of Article IV, reading: 'The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or of any particular State.'

The full scope of this paragraph has never been settled. Primarily, at least, it is a grant of power to the United States of control over its property. That is implied by the words, 'territory or other property.' It is true it has been referred to in some decisions as granting political and legislative control over the Territories as distinguished from the States of the Union. * * * But clearly it does not grant to Congress any legislative control over the States, and must, so far as they are concerned, be limited to authority over the property belonging to the United States within their limits. * * * The powers affecting the internal affairs of

the States not granted to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, and all powers of a national character which are not delegated to the National government by the Constitution are reserved to the *people* of the United States.

* * * * * * *

This very matter of the reclamation of arid lands illustrates this: At the time of the adoption of the Constitution within the known and conceded limits of the United States there were no large tracts of arid land, and nothing which called for any further action than that which might be taken by the legislature of the State, in which any particular tract of such land was to be found, and the Constitution, therefore, makes no provision for a national control of the arid regions or their reclamation. But, as our national territory has been enlarged, we have within our borders extensive tracts of arid lands which ought to be reclaimed, and it may well be that no power is adequate for their reclamation other than that of the National Government. *But if no such power has been granted, none can be exercised.*

* * * * * * *

As to those lands within the limits of the States, at least of the Western States, the National Government is the most considerable owner and has power to dispose of and make all needful rules and regulations respecting its property. We do not mean that its legislation can override state laws in respect to the general subject of

reclamation. *While arid lands are to be found, mainly if not only in the Western and newer States, yet the powers of the National Government within the limits of those States are the same (no greater and no less) than those within the limits of the original thirteen*, and it would be strange if, in the absence of a definite grant of power, the National Government could enter the territory of the States along the Atlantic and legislate in respect to improving by irrigation or otherwise the lands within their borders. Nor do we understand that hitherto Congress has acted in disregard to this limitation." (pp. 86-92.)

After quoting from the opinion of Mr. Justice White in *Gutierres vs. Albuquerque Land Co.*, 188 U. S. 545, 554, to the effect that the purport of the previous acts of Congress is "reflexively illustrated" by Section 8 of the National Reclamation Act (Act of June 17, 1902, 32 Stat. 388) wherein it is provided that nothing in the act shall be construed as affecting or interfering with the laws of any State or Territory relating to the control, appropriation, use or distribution of water used in irrigation, and that the Secetary of the Interior in carrying out the act shall proceed in conformity with local laws, he disposed of the contention of the United States for national control in the following language:

"But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that *each State has full jurisdiction over the lands within its borders, including the beds of streams and other waters.* (Citing cases.) * * *

> *It may determine for itself* whether the common law rule in respect to riparian rights, or that doctrine which obtains in the arid regions of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any State." (pp. 93-4.)

To the argument that Congress had expressly imposed the common law on all the Western territory prior to its formation into States he made answer:

> "But when the States of Kansas and Colorado were admitted into the Union they were admitted with the full powers of local sovereignty which belonged to other States (citing cases), and Colorado by its legislation has recognized the right of appropriating the flowing waters to the purposes of irrigation. Now the question arises between two States, one recognizing generally the common law rule of riparian rights and the other prescribing the doctrine of the public ownership of flowing water. *Neither State can legislate for or impose its own policy upon the other.* A stream flows through the two and a controversy is presented as to the flow of that stream. It does not follow, however, that because Congress cannot determine the rule which shall control between the two States, or because neither State can enforce its own policy upon the other, that the controversy ceases to be one of a justiciable nature, or that there is no power which can take cognizance of the controversy and determine the *relative rights of* the two States. Indeed, the disagreement, coupled

with its effect upon a stream passing through the two States, makes a matter for investigation and determination by this Court. * * * As Congress cannot make compacts between the States, as it cannot, in respect to certain matters, by legislation compel their separate action, disputes between them must be settled either by force or else by appeal to tribunals empowered to determine the right and wrong thereof. Force under our system of government is eliminated. The clear language of the Constitution vests in this Court the power to settle those disputes. We have exercised that power in a variety of instances, determining in the several instances the justice of the dispute. *Nor is our jurisdiction ousted, even if, because Kansas and Colorado are States sovereign and independent in local matters, the relations between them depend in any respect upon principles of international law.* International law is no alien in this tribunal. * * *

'Sitting, as it were, as an international, as well as a domestic tribunal, we apply Federal law, state law and international law, as the exigencies of the particular case may demand.' " (pp. 95-7.)

Of the equal rights of States of the Union, the relation of the citizen and his usufructuary private rights to the State and the rule which must be applied in the settlement of controversies between States he said:

"*One cardinal rule, underlying all the relations of the States to each other, is that*

of equality of right. Each State stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none. Yet, whenever, as in the case of *Missouri vs. Illinois*, 180 U. S. 208, the action of one State reaches through the agency of natural laws into the territory of another State, the question of the extent and limitations of the rights of the two States becomes a matter of justiciable dispute between them, and this Court is called upon to settle that dispute *in such a way as will recognize the equal rights of both and at the same time establish justice between them.* In other words, through these successive disputes and decisions this Court is practically building up what may not improperly be called interstate common law. This very case presents a significant illustration. Before either Kansas or Colorado was settled the Arkansas River was a stream running through the territory which now composes these two States. Arid lands abound in Colorado. Reclamation is possible only by the application of water, and the extreme contention of Colorado is that it has a right to appropriate all the waters of this stream for the purposes of irrigating its soil and making more valuable its own territory. But the appropriation of the entire flow of the river would naturally tend to make the lands along the stream in Kansas less arable. It would be taking from the adjacent territory that which had been the customary natural means of preserving its

arable character. On the other hand, the possible contention of Kansas, that the flowing water in the Arkansas must, in accordance with the extreme doctrine of the common law of England, be left to flow as it was wont to flow, no portion of it being appropriated in Colorado for the purposes of irrigation, would have the effect to perpetuate a desert condition in portions of Colorado beyond the power of reclamation. Surely here is a dispute of a justiciable nature which must and ought to be tried and determined. *If the two States were absolutely independent nations it would be settled by treaty or by force.* Neither of these ways being practicable, it must be settled by decisions of this Court.

It will be perceived that Kansas asserts a pecuniary interest as the owner of certain tracts along the banks of the Arkansas and as owner of the bed of the stream. We need not stop to consider what rights such private ownership of property might give.

'In the case before us, the State of Kansas files her bill as representing and on behalf of her citizens, as well as in vindication of her alleged rights as an individual owner. * * *. *The action complained of is state action and not the action of state officers* in abuse or excess of their powers.'

It is the State of Kansas which invokes the action of this Court, charging that through the action of Colorado a large portion of its territory is threatened with disaster. In this respect it is in no manner evading the provisions of the Eleventh

Amendment to the Federal Constitution. *It is not acting directly and solely for the benefit of any individual citizen to protect his riaprian rights.* Beyond its property rights it has an interest as a State in this large tract of land bordering on the Arkansas River. Its prosperity affects the general welfare of the State. *The controversy rises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint. Georgia vs. Tennessee Copper Co.*, decided this day, *post*, p. 230.

This changes in some respect the scope of our inquiry. It is not limited to the simple matter of whether any portion of the waters of the Arkansas is withheld by Colorado. *We must consider the effect of what has been done upon the conditions in the respective States and so adjust the dispute upon the basis of equality of rights* as to secure as far as possible to Colorado the benefits of irrigation without depriving Kansas of the like beenficial effects of a flowing stream. * * * we are justified in looking at the question not narrowly and solely as to the amount of the flow in the channel of the Arkansas River, inquiring merely whether any portion thereof is appropriated by Colorado, but we may properly consider what, in case a portion of that flow is appropriated by Colorado, are the effects of such appropriation upon Kansas territory. * * * May we not consider some appropriation by Colorado of the waters of the Arkansas to the irrigation

and reclamation of its arid lands as a reasonable exercise of its sovereignty and as not unreasonably trespassing upon any rights of Kansas?" (pp. 97-102.)

The local law of riparian rights as applied in Kansas and the equitable division of the waters of the stream between the riparian owners, all having equal rights to the use thereof under the riparian doctrine, is then discussed and the opinion continues:

> "As Kansas thus recognizes the right of appropriating the waters of a stream for the purposes of irrigation, subject to the condition of an equitable division between the riparian proprietors, she cannot complain if the same rule is administered between herself and a sister State. And this is especially true when the waters are, except for domestic purposes, practically useful only for purposes of irrigation." (pp. 104-5.)

After a discussion of the evidence, including the character of the stream, the administration of diversions in Colorado by State authorities, the benefits derived by irrigation from the waters of the Arkansas River in that State and the detriment to certain portions of Kansas, he continued:

> "At one time there were some irrigating ditches in these western counties, which promised to be valuable in supplying water and thus increasing the productiveness of the lands in the vicinity of the stream, and it is true that those ditches have ceased to be of much value, the flow in them having largely diminished.

> *It cannot be denied in view of all the testimony * * * that the diminution of the flow of water in the river by the irrigation of Colorado has worked some detriment to the southwestern part of Kansas*, and yet when we compare the amount of this detriment with the great benefit which has obviously resulted to the counties in Colorado, *it would seem that equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation.*" (pp. 113-114.)

After further discussion of certain facts peculiar to the case there presented, Mr. Justice Brewer thus concluded and disposed of the controversy:

> "Summing up our conclusions, we are of the opinion * * * *that the appropriation of the waters of the Arkansas by Colorado, for purposes of irrigation, has diminished the flow of water into the State of Kansas;* that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of *perceptible injury* to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both States and the right of each to receive

benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree. At the same time it is obvious that if the depletion of the waters of the river by Colorado continues to increase there will come a time when Kansas may justly say that there is no longer an equitable division of benefits and may rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes.

The decree which, therefore, will be entered will be one dismissing the petition of the intervenor, without prejudice to the rights of the United States to take such action as it shall deem necessary to preserve or improve the navigability of the Arkansas River. The decree will also dismiss the bill of the State of Kansas as against all the defendants, without prejudice to the right of the plaintiff to institute new proceedings whenever it shall appear that through a material increase in the depletion of the waters of the Arkansas by Colorado, its corporations or citizens, the substantial interests of Kansas are being injured to the extent of destroying the equitable apportionment of benefits between the two States resulting from the flow of the river." (pp. 117-118.)

Kansas vs. Colorado, 206 U. S., pages *supra.*

We are uable to concur with counsel for Wyoming in their theory that this great case between

States was determined upon the narrow grounds of the doctrine of private riparian rights, or that the equitable division between the States, of rivers common to two or more of them, is narrowed in its limits to riparian users. We are inclined to construe the language, upon which counsel predicates such an argument, with the remainder and to read the opinion as a whole, rather than to adopt that portion, referring alone to an admission against interest by Kansas, as an announcement by this Court of the general principle controlling the rights of States in their use of interstate streams. The decision as a whole would indicate that Kansas had failed to prove either the allegations of her complaint or that Colorado was exercising her sovereign rights in an inequitable manner with regard to the rights of her neighboring State.

And, while the rights of riparian users within the State are equal one with the other, yet the rights of States of the Union to control the natural resources within their borders are equal one with the other; and it would seem, from the opinion, that any doctrine of equitable apportionment of the waters of rivers between States must be founded upon a broad basis of equitable consideration of all the facts of each case as they appear, with full regard to the equal rights of States of equal dignity, powers and jurisdiction, and not upon the narrower basis of local laws governing mere usufructuary rights of private citizens, which rights are at all times within the control of and may be taken away by the State, according to its sovereign will. The language of the opinion is:

> "But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case *that each State has*

full jurisdiction over the lands within its borders, including the beds of streams and other waters. (Citing cases.) * * *

It may determine for itself whether the common law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any State." (pp. 93-94.)

"*One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none.* Yet, whenever, as in the case of *Missouri vs. Illinois*, 180 U. S. 208, the action of one State reaches through the agency of natural laws into the territory of another State, the question of the extent and the limitations of the rights of the two States becomes a matter of justiciable dispute between them, and this Court is called upon to settle that dispute *in such a way as will recognize the equal rights of both and at the same time establish justice between them.*" (pp. 97-8.)

"It is the State of Kansas which invokes the action of this Court, charging that through the action of Colorado a large portion of its territory is threatened with disaster. In this respect it is in no manner evading the provisions of the Eleventh Amendment to the Federal Constitution. *It is not acting directly and solely for the bene-*

fit of any individual citizen to protect his riparian rights. Beyond its property rights it has an interest as a State in this large tract of land bordering on the Arkansas River. Its prosperity affects the general welfare of the State. *The controversy rises, therefore, above a mere question of local private right and involves a matter of State interest, and must be considered from that standpoint. Georgia vs. Tennessee Copper Co.*, decided this day, *post*, p. 230.

This changes in some respect the scope of our inquiry. It is not limited to the simple matter of whether any portion of the waters of the Arkansas is withheld by Colorado. *We must consider the effect of what has been done upon the conditions in the respective States and so adjust the dispute upon the basis of equality of rights* as to secure as far as possible to Colorado the benefits of irrigation without depriving Kansas of the like beneficial effects of a flowing stream." (pp. 99-100.)

It will be noted that Kansas had made appropriations prior to those complained of in Colorado and that diversions by Colorado ditches had cut off the water supply of these canals and had worked detriment to Kansas and her prior appropriations, but this court said:

"When we compare the amount of this detriment with the great benefit that has obviously resulted to counties in Colorado, it would seem *that the equality of right and equity between the two states forbids* any interference with the present withdrawal of

water in Colorado for the purposes of irrigation." (p. 114.)

The above quoted language, when read with the rest of the opinion, would seem to indicate the controlling, fundamental principle to be that of equality of right between the two States and not equality of right between individual citizens of either thereof, and further, that in the exercise of her sovereign right to sustain hereslf and her people and to obtain the benefits from the natural resources within her domain, the upper state may divert the waters of the interstate stream to the injury of the lower State or her citizens, so long as by so doing the upper State shall not deprive the lower State of an equitable portion of the common resource, and, that what may be an equitable portion must be determined upon the facts and circumstances of each particular case construed so as to recognize and preserve the equal rights of both States "and at the same time establish justice between them."

The late Mr. Kinney interpreted the decision as follows:

> "Therefore, as to the rights in and to the waters of interstate streams the law of this case, summed up in a concise statement, seems to be that each State through which an interstate river runs is entitled to make reasonable use of its waters, even to the extent that the state below may be damaged to a considerable extent thereby, provided the upper State does not divert the waters in excess of what will give it an equitable apportionment, all facts considered, of the benefits of the river, which apportionment is not confined to an equal division between the

two States, or the respective States, of the entire natural flow of the stream."

Kinney on Irrigation and Water Rights (2nd Ed.), Vol. III, p. 2216.

But even though we here construe the decision within the narrower limits and assume an equal apportionment of the waters of the stream, we here find that the Laramie River rises not in one, but in both States. The waters of the Wyoming part of the stream, as well as those of the Colorado branch, are available to Wyoming and her citizens. On the other hand, natural conditions are such that Colorado is limited, by her great tunnel and all other means of diversion, to use of but a part (91/250) of the waters of that branch which rises and flows within her borders, and the remainder thereof must forever flow into Wyoming, there to unite with the other waters of the stream for the use and benefit of the lower state. Whatever the injury might be to Wyoming (though none has been proved), this would not appear to be an inequitable use of her own resources by Colorado. Even if we were to assume, for argument, that the Laramie River had its rise wholly within Colorado, and that Wyoming had the right to one-half the waters, in order that both States might obtain equal benefits, Colorado would still be limited to 91/250 of the stream. But in truth she is limited to 91/470 of the waters of the stream common to both States. Diversions of such an amount would not seem inequitable between equal States.

As we read the opinion, after determining adversely the claim of the United States for National control of all interstate streams for purposes of irrigation and reclamation, and after defining the dignity and equality of the States and the jurisdiction of each thereof over the waters of the streams within

her borders, as well as the relation of the States one with the other as members of the Union, this Court decided that, notwithstanding Colorado and her citizens had damaged Kansas by diversion of waters of the river in Colorado, Kansas had failed to prove such a case against Colorado as would justify this Court to intervene and enjoin Colorado and her citizens from use of the stream; and, that this Court would not interfere until such a time as Colorado, by additional use, might so deplete the flow of the stream, to the injury of the substantial interests of Kansas, as to destroy an "equitable apportionment of the benefits between the two States" of equal rights and sovereign powers as members of the Union. And further, that inasmuch as Kansas recognized "the right of apportioning the waters of the stream for purposes of irrigation, subject to the condition of equitable division between the riparian owners, she cannot complain if the same rule is administered between herself and a sister State."

In other words, the decision in *Kansas vs. Colorado* is similar to that in *Missouri vs. Illinois*, where the bill of Missouri was likewise dismissed on failure of Missouri to prove such a case against Illinois as would justify this Court to interfere and prevent Illinois from exercising her sovereign jurisdiction over her territory and her rivers, and where it was held that Missouri had no ground to complain when she, in fact, was contributing to the cause which provoked the controversy.

Applying to this case the principles announced in the above decisions and the other cases, *supra*, we find that Wyoming has wholly failed to prove the allegations of her bill, and even more, has by her own conduct denied her charges against Colorado by permitting appropriations for and authorizing construc-

tion of many new and enormous enterprises in Wyoming, long junior to the Colorado enterprise of which she complains and drawing water from the same stream; and, irrespective of other conclusive proof, has thereby admitted that there was and is ample water in the stream to supply all appropriations junior, as well as senior, to the Colorado enterprise, and that no injury could result to senior appropriations in Wyoming by reason of the Colorado diversion; and that by her official acts, she has contributed to the very depletion whereof she complains. Further, the proof shows that not only is there ample water in the stream for use of all Wyoming enterprises, senior and junior to the Colorado project, but as well that Wyoming needlessly wastes more water than will be withdrawn from the stream by Colorado. And, furthermore, while she complains of Colorado making use of a part of her own waters outside the immediate drainage of that lesser tributary of the Platte River here involved, the proof reveals, without contradiction, that Wyoming is not only diverting from the drainage of the Cache la Poudre over into that of the Laramie (1516-18, 1577, 1595-6) and permitting the great Wheatland enterprise to make an inter-watershed diversion in all respects similar (save possibly for degree) to that whereof she complains in Colorado, (1511-13, Def. Orig. Brief, Vol. II, pp. 27-38), but, even more, that Wyoming generally recognizes and permits such diversions, by official sanction and decrees of her courts, within her own territory, and by means thereof she has been able to effect her most valuable reclamation and development. No proof was offered in support of her claims as a riparian owner and, on the other hand, by her constitution, laws and the decisions of her courts, she has abolished and denied any such; and, lastly, she

has offered no sufficient proof whereby this Court could adjudicate and determine the relative rights of appropriation within either Wyoming or Colorado, if such a rule as she alleges were here applied.

By her failure to prove the allegation of her bill in the above and other respects she has not brought herself within the rule:

> "*Before this Court ought to intervene the case should be of serious magnitude, clearly and fully proved, and the principle to be applied should be one which the Court is prepared deliberately to maintain against all considerations on the other side.* See *Kansas vs. Colorado*, 185 U. S. 125.
>
> As to the principle to be laid down the caution necessary is manifest. * * * To decide the whole matter at one blow by an irrevocable fiat would be at least premature." (200 U. S. 521.)

And:

> "It would seem that equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation." (206 U. S. 114.)

We discussed the history of diversions of water from one stream for use upon lands within the drainage of another stream in Part I, Volume II of our original brief, and there observed that such diversions have prevailed throughout the world from antiquity, wherever irrigation is necessary; that such diversions are common throughout the Western States, both with private and public enterprises and those of the United States Reclamation Service; that

such diversions have prevailed in Wyoming and Colorado and that the same are and always have been recognized, permitted and approved by the laws of both of the States and are recognized and decreed by their courts. We also discussed the law of inter-watershed diversions throughout the States, and as interpreted by the courts of the United States, and found the same to be generally sanctioned and approved. We could add but little to that which already appears, and to which no answer has been made by complainant. In Volume II of this Supplemental Brief we shall discuss the facts more at length.

VIII. CONCLUSION.

We therefore conclude:

(1) That the general principles of prior appropriation are rules of *intra state* law; that their interpretation and application within each of the states, varies according to local conditions and necessities; that in no two of the States are the laws and decisions or rules and methods of application of the general principles the same; that the usufructuary rights permitted the citizens under the application of the general doctrine by each State, according to the local laws, conditions and necessities obtaining, are at all times within the control of the State and subject to the exercise of its police power; that the usufructuary rights of individuals may be taken away by the State through its superior power of eminent domain, as its future necessities may require; and that the general principles of prior appropriation are subject to be restricted and their operation limited in this case by state lines.

(2) That the rules and laws governing the usufructuary rights of the appropriator under the gen-

eral principles of prior appropriation are inapplicable to the sovereign rights of States; that the general principles of prior appropriation are incapable of application and administration for the regulation of diversions from interstate streams and their application would be inequitable and impracticable; that application of the general principles to interstate streams would be to impose exclusive and perpetual servitudes upon the territory and natural resources of one State, without consent, and to deny to that State and its inhabitants the use of a provision which nature has supplied entirely within its own territory, for the sole benefit of a neighboring State, and would violate the sovereign rights of States standing upon an equality as members of the Union; and that the general principles of prior appropriation cannot apply to interstate streams, without regard to state boundaries.

(3) That this case is to be controlled by the fundamental principles: that each State of the Union has the sovereign right to utilize and enjoy the natural resources and waters of the streams within its territory, according to its present and future conditions and necessities and those of its citizens and inhabitants, and has the sovereign right to grant to its citizens usufructuary rights to such natural resources, subject at all times to the superior rights of the State; that each State may utilize the natural resources and streams within its borders in such manner and to such degree as it may elect, and whenever the exercise of its sovereign powers shall be questioned by another State, this Court will not intervene unless, under all the facts and circumstances of the case, it shall appear that the one State is unreasonably injuring the other or interfering with the sovereign rights thereof; and that the exercise of its

sovereign rights by a State will not be disturbed unless the case be of serious magnitude, clearly and fully proved, and the principle to be applied be one which the Court is prepared deliberatly to maintain against all considerations on the other side and that, in such case, the dispute between the States shall be settled in such a way as will recognize the equal sovereign rights of both States and at the same time establish justice between them.

We respectfully urge that the State of Wyoming has failed to prove the allegations of her bill or that the diversion of which complaint is made will in any manner injure her or her citizens; that the State of Colorado, by the diversion of a portion of the waters of the branch of the Laramie River within her territory, is not exercising her sovereign powers in an unreasonable manner or in any manner interfering with Wyoming in the exercise of her sovereign rights; and, therefore, that the suit should be dismissed.

Respectfully submitted,

PLATT ROGERS,
FRED FARRAR,
Of Counsel.

THE STATE OF COLORADO, ET AL., DEFENDANTS.

BRIEF FOR DEFENDANTS.

Volume II

PART I.

INTER-WATERSHED DIVERSIONS.

THIS GENERAL SUBJECT WILL BE TREATED AS FOLLOWS:

INTER-WATERSHED DIVERSIONS—

(1) FOREIGN COUNTRIES—

(a) *India*
(b) *France*
(c) *Ceylon*
(d) *Asia Minor*
(e) *Italy*
(f) *Spain*
(g) *Other diversions in Eastern Hemisphere*

(2) HAWAIIAN ISLANDS

(3) CANADA

(4) UNITED STATES RECLAMATION SERVICE

(5) SEVERAL STATES OF THE UNITED STATES

(a) *California*
(b) *Utah*
(c) *Montana*
(d) *Idaho*
(e) *Nevada*
(f) *Oregon*

(6) COLORADO AND WYOMING

(a) *Colorado*
(b) *Wyoming*

CAUSES OF INTER-WATERSHED DIVERSIONS

THE LAW OF INTER-WATERSHED DIVERSIONS. (See outline at beginning of discussion of law on this subject.)

INTER-WATERSHED DIVERSIONS.

This controversy involves the diversion of waters of the Big Laramie River, one of the tributaries of the north branch of the Platte River, through the intervening divide and into the

drainage area of the Cache la Poudre River, one of the tributaries of the south branch of the Platte River. (1445, 1479.) The water so diverted will be used for irrigation of lands in the Cache la Poudre Valley. The Big Laramie rises entirely within the State of Colorado and diversion and application are made within that State. No portion of the diversion works and no part of the lands to be served are situate within the State of Wyoming.

The diversion is absolutely inter-watershed in its character and no part of the water flowing through the tunnel connecting the two streams ever returns to the Laramie River. This diversion is the last and final inter-watershed diversion which can ever be made from the Laramie to the Cache la Poudre in Colorado, and all the remainder of the water of the Big Laramie must forever pass out of Colorado into Wyoming. (1763-7, 1395, 1624.)

In addressing ourselves to this phase of the case, we shall first of all consider diversions of this character from a historical standpoint, both in foreign countries and the United States, and later will discuss in particular the history of such diversions both in Colorado and Wyoming. The causes for such diversions and the law relating thereto will be separately treated.

This topic received exhaustive consideration by Prof. L. G. Carpenter, whose masterly presentation should be incorporated in full in the brief. His illuminating testimony tells the story of such diversions wherever irrigation has prevailed since antiquity, and should be read in full and considered with the many exhibits prepared and offered by defendants. (See marginal pages 1423-1610 inclusive, 3902-7 inclusive, Defendants' Exhibits 22-50 inclusive.) (See also testimony of John E. Field, 3597-3615, same subject.)

(1) FOREIGN COUNTRIES.

Diversion of water from one stream for irrigation of land situate within the drainage area of another stream is and has been universal in foreign countries wherever irrigation has prevailed. (1446, 3597.) It was practiced before the time of Christ (1467), and has since prevailed on the eastern hemisphere. (1445-1519, 3907-8.)

(a) *India.*

India furnishes the most notable example, largely because of the scale on which the work has been constructed and also from the fact that it is a country that has been densely populated for thousands of years and has been, in many respects, one of high civilization.

On the north are the Himalaya Mountains of very high elevation with large rain-fall, filled with glaciers and glacial lakes in many places. At the base, on the south, the peninsula is practically cut across by the river systems of the Indus and Ganges, the former flowing westward to the Indian Ocean and the latter eastward to the Bay of Bengal. These two streams catch all the run-off of the Himalaya Mountains and have many large tributaries, some running into the Ganges and the Indus, large tributaries, some running into the Ganges and the Indus. The divide in the central part of the continent is rather low, and there are mountains in the central parts of India and Hindustan south of these rivers. (1447.)

There have been inter-watershed diversions from these streams from a very early date. It was a country of intense population, great intellectual development and centralized authority. (1447.)

The Jumna is the western tributary of the Ganges and is almost on the border line. It rises in the Himalayas and flows eastward into the Ganges. A tributary of the Indus is situate a few miles to the west. A canal was built across the watershed from the Jumna to the tributary of the Indus as early as the twelfth century by a celebrated Indian ruler, Feroz. His name is still identified with some of the cities and other portions of that country. After having been used for a number of years, the canal seems to have fallen into disuse and so remained until reconstructed in 1568 by Akbar, another ruler of great energy. It was again allowed to fall into disrepair through local strife and lack of energy of the rulers, but was rebuilt about a century later under the ruler Shah-Jeham. When the British took charge of the country, they found this canal in bad repair. Warren Hastings took an active part in attempting its reconstruction and his activities in this regard were made matters of accusation. The canal was practically rebuilt in 1820 by the English and reconstructed on a still larger scale in 1870 and is now 84 miles long, supplies 555,000 acres and carries about 800 cubic feet per second, carrying water as far as 125 miles west of the Jumna to Sirea. The canal is known as the Western Jumna and practically all of the acreage served by it is outside of the watershed of the stream that supplies it. (1448.) The canal has repaid the entire expense to the English Government and $5,000,000 in addition, and also in addition to the taxes and returns received by the Government. (1449.) This canal, as well as the Eastern Jumna Canal, is designated on Sketch Map prepared by Prof. L. G. Carpenter, *Defendants' Exhibit 22.*

Near Bombay, a large reservoir, the Bhatode Tank, is an unfinished project of unknown date on the Meheree River, where water is carried from one watershed to another. (3907.)

A series of inter-watershed diversions are now under construction in the Indus valley. A number of old canals in that region run back to an unknown time, some of them built by private parties and some built by native rulers, as there are several native states that are not under British control.

The whole plain irrigated by the Western Jumna suffers at times through lack of sufficient water to obtain maximum production and the population is so great that in such cases there is famine and great loss of life. The English have planned to extend the diversion from tributaries of the Indus River. Each tributary is an enormous stream and has a large system of canals. These streams and the proposed canals to supplement the existing system are shown on *Defendants' Exhibit 23.* (1450.)

The English propose to build a canal starting from the Indus and running over to the Jhelum, a distance of approximately 60 miles. This water will then be available to supply the other ditches down the Jhelum and enable them to take out another ditch about 100 miles farther up the river that will carry water from the Jhelum over to the Chenab to supply other ditches on that stream and also to enable another ditch to be taken from the Chenab about 40 miles up stream and run a distance of about 100 miles to the Ravi, and then carried on beyond the Ravi to the lower Bari Doab canal. This is made possible by substitution of water through the canal for that diverted above. The taking of water from the Indus drainage, where the construction is now under way, is really intended to supplement the Bari Doab Canal, a distance of 50 miles or more, and to cross over the large streams by a system of exchange, but, in fact, carrying the water from the first stream across to the last. (1450-1.)

Defendants' Exhibit 24 portrays the canals on the upper portion of the Ganges River. It includes the Ganges, Jumna, Ramganga and others in the region covered by the Ganges canal. The enormous Ganges canal is about 600 miles long and carries water out of the Ganges basin over into the basin of the Indus and also over into the Jumna basin. In order to build the Western Jumna canal and to serve additional country west of the Jumna, a shortage of water would be occasioned to the Eastern Jumna canal and a plan has been considered of supplementing the supply of the latter canal from some of the other streams, probably by building the supply canal from the Sardah River, about 150 miles long and running over to the Ganges. The increased amount taken from the upper Ganges canal can be delivered to the Eastern Jumna canal by a branch about 20 miles long and thus decrease the demand on the Jumna River and increase the supply of the Western Jumna Canal which runs over on the other side of the divide. The result of this

proposed construction is to enable the water of the Sardah River to be used about 300 miles to the west and on the western slope of India while the Sardah is a tributary of the eastern slope. (1452-3.)

The Periyar project is in the Madras Presidency in southern India. Water from the Arabian Sea drainage is carried *through the continental divide by a tunnel* and delivered into the Vaigai River and carried in that stream a distance of about 60 miles to the land to be irrigated. The project includes a large reservoir at the upper end of the Periyar River on the Arabian Sea drainage and immediately adjacent to the 6,000 foot tunnel of the project. The water so diverted from the Arabian drainage is used to irrigate lands on the drainage of the Bay of Bengal. The project has been completed for a number of years and irrigates about 120,000 acres. This project is quite similar in many respects to the Greeley-Poudre project here in controversy. The reservoir is larger, but the tunnel is less than half as long as that of the Greeley-Poudre project. The two projects are also similar in that the stream in whose drainage the lands to be irrigated are situate is used as a carrier of the water for some 60 miles from the tunnel portal to the point of diversion or application. The similarity of the two projects will be further noted by consulting the sketch map prepared by Prof. Carpenter, *Defendants' Exhibit 25.* (1453-4.)

The Kurnool-Cuddapah canal, carrying 3,000 cubic feet of water per second, carries water between the drainages of the Krishna and Penner Rivers in the Madras Presidency in southern India. Two other projects, one above and one below the Kurnool are proposed, the upper or Krishna diverting water about 100 miles above the Kurnool and crossing several tributaries and the summit of the divide, watering land on both sides. The Krishna and Penner Rivers are independent streams, each flowing directly into the Bay of Bengal. Their watersheds are distinct from one another. The location of these canals is noted on the sketch map, *Defendants' Exhibit 26.* (1455-56.)

The projects mentioned are among the more notable of those in India. These diversions are from one stream to another that are not tributary to each other. There are many others on a lesser scale. (1456.) There are private ditches in India costing hundreds of millions of dollars that are not indicated in government reports and serving lands regardless of situation with relation to the principal streams from which the diversions are made.

No opposition has been offered to the construction of any of the immense canals of India by reason of their inter-watershed diversions. Such construction seems to be taken as a matter of course. (1457.)

(b) *France.*

In southern France irrigation is required. The rain-fall is light and water is available on the other side of the mountains from near Marseilles eastward along the Mediterranean. The same condition pertains to a large degree with the interior of the country along the Rhone for some distance from the coast, including that portion of the country settled by the Romans, whose ruins still remain. Adjacent to Marseilles, there are a number of canals brought from the Durance to the north. This stream is a tributary of the Rhone and drains a portion of the Alps, but is separated from the coast by mountains. On the south side of these mountains the rain-fall is very light and the country of beautiful climatic conditions, in the vicinity of Marseilles, Nice and Monaco. The land produces bounteously with the application of water, and, of consequence, diversions from other watersheds have been made from the earliest times. (1458.)

The Romans built canals of record length to supply a part of this country along the coast near Marseilles, and north of it is the plain known as the Crau, separated from the Durance by a divide of considerable elevation, and canals have supplied water to the plains from the Durance for some centuries. (1457.)

The Canal of Crapponne and the Canal del Alpine, both taking water from the Durance, convey it across the divide for irrigation on the plain. The Crapponne canal was built in 1650 by Adam de Crapponne. It covers the plains northwest of Marseilles and east of the old Roman city of Arles. A part of the water finally reaches the Rhone, but most of the land irrigated is not tributary to the Rhone but drains directly into the Mediterranean. *Defendants' Exhibit 32* is a photograph of a masonry aqueduct on this canal near the city of Arles. The Crapponne canal bears a strong resemblance to the Sky Line diversion of The Water Supply & Storage Company in Colorado, taking water from the Laramie River into the Poudre drainage and also the Grand River and Michigan River ditches of the same system, each of which will be hereafter more fully discussed.

The Alpine canal was built about 1772. It also diverts water from the Durance, crosses the same divide and serves much the same territory as that served by the Crapponne. These canals are noted on sketch map, *Defendants' Exhibit 27.* (1459.)

The Marseilles Canal diverts from the Durance, crosses the same range of mountains and serves land in the suburbs of Marseilles and also supplies the city with water. It was constructed between 1840 and 1850. It is a large canal with many aqueducts. (1459.)

The Verdon Canal diverts water from the Verdon River,

a branch of the Durance, and carries it over the mountain divide into the basin tributary to the city of Aix. It supplies the small town with water and irrigates the whole basin. It was commenced about 1863 and serves about 40,000 acres of land. Both the Verdon and Marseilles Canals are shown on *Defendants' Exhibit 27.*

The Carpentras Canal diverts water from the Durance at a point near the head-works of the Marseilles canal. It runs thence north, while the other French canals already mentioned extend south. This canal covers the territory between the Durance and the Aiges Rivers. It also crosses the historical stream Vaucluse and supplies territory near the city of Carpentras. This region has been irrigated from very early times. There is a charter for a ditch on file at Avignon dating back to 1101. The present Carpentras Canal is really an extension of ditches that were built at a remote period, so that the name properly applies to the extension. There are other concessions or charters of ditches dating back to the twelfth century, for instance, 1171. The present canal of Carpentras was projected in 1556, but the affair seems to have been suspended because of religious worries at that time, which resulted in the massacre of St. Bartholomew's Eve. The canal was taken up about a century later and encountered difficulty because of the financial panic due to John Law and his Louisiana scheme. Portions of it were constructed in 1780 and the present canal was completed in 1858.

In this case the water of the Durance is taken across a number of the tributaries of the Rhone and for a distance of something like 40 miles along the foot of the mountains. (1461-2, *Defendants' Exhibit 28*). An aqueduct of the canal as it crosses the Vaucluse is shown in *Defendants' Exhibits 33 and 34.*

The canal of the Gap is east of the Carpentras Canal and diverts water into the Durance watershed from the Isere watershed. The enterprise practically surrounds the Carpentras canal. It takes from the Isere, which empties into the Rhone 75 miles south of Avignon, and thence runs into the valley of the Gap, which is a part of the Durance watershed. It runs for some distance through an open channel and then through a tunnel nearly two miles long and then delivers into the valley of the Gap and distributes on both sides of the valley. While previous canals have taken water from the Durance, this canal brings water into the Durance watershed, reversing the operation, illustrating the general principle that where conditions require, these transfers occur as a matter of economic development. (1462-3, *Defendants' Exhibit 29.*)

The diversions in France differ from the diversions in India only in magnitude. The same general principle prevails.

If these French inter-watershed diversions had not been made, a probable loss of life in the vicinity of Marseilles would have followed and it would have meant the failure or suspension of population east of Arles on the great plains now supplied by this water and elsewhere in the vicinity of Avignon. The country would have been developed to but a very small extent had it not been for these inter-watershed diversions. Without irrigation, agriculture in southern France is on the verge of failure at all times and the irrigation has merely increased the productive capacity. (1463-5.)

The canal of Nimes, while not of the importance of those already mentioned, is nevertheless of historical importance. It illustrates the same general principles surrounding inter-watershed diversions. The city of Nimes was an old Roman city, like Arles, Avignon, Marseilles and Aix, and with slight rainfall in the summer. Water was needed for both irrigation and municipal supply. The city had a canal bringing water about 15 miles through tunnels and by means of celebrated aqueducts, of which the aqueduct known as Pont du Gard is one. This aqueduct is shown on the photograph, *Defendants' Exhibit 30*, taken in 1892 by Prof. L. G. Carpenter and shows the aqueduct at the lower end as it crosses the Gard. At about one-third its height is seen a series of arches attached to the side of the main aqueduct, built by the French in 1860 as an addition to the side of the aqueduct to support a road. The aqueduct itself was built a little before the time of Christ. The channel is above the uppermost series of arches and the structure is one of the most celebrated irrigation works in the world because of its beauty of proportions. In order to make this masonry conduit, there are three series of super-imposed arches carrying the tunnel. The water was taken to the city of Nimes and its vicinity. The aqueduct is now broken and in disrepair. By this aqueduct, the Roman baths, domestic requirements of the city, and irrigation of the lands were supplied. (1466-7.)

Defendants' Exhibit 31 gives a view through the tunnel a little below the end of this aqueduct shown on Exhibit 30. This tunnel was built by the Romans to carry water through the ridge.

(c) *Ceylon.*

The Abonganga series of works in the island of Ceylon involves the transfer of water from one watershed for use upon another. (3907.)

(d) *Asia Minor.*

Transfers between the Tigris and Euphrates Rivers are very ancient and extensive and of historical importance. They

have recently attracted more or less attention because of recent restoration. There are a number of ancient canals still in existence and a good many take water from one of these streams and carry it across the divide for use within the drainage area of the other stream. During the last few years, projects costing many millions of dollars have been in course of construction and are largely completed. These are not altogether the rebuilding of old canals, but are, in the main, near the lines of the old canals that have fallen into disuse. (3907-8.)

(e) *Italy.*

Professor Carpenter in his testimony (1469) says:

"In Italy, the conditions are somewhat analogous to India, but on a very much smaller scale. That is, there are a series of streams coming down from the Alps on the north which join and form the stream known as Po. These streams coming from glaciers of the Alps, are quite large and fairly continuous because many of them are held by glacial lakes or reservoirs like Lake Como and Lake Maggiore.

This is the greatest region of irrigation in Italy because of the extent of the Valley of the Po, its water supply and ease of irrigation; but does by no means comprise the entire irrigation of Italy. It is the one that is spoken of in speaking of Italian irrigation.

The irrigation in the valley of the Po goes back to a very early date and there were large canals built in the twelfth and thirteenth centuries especially near Milan, a town near Venice. There are two canals known as the Naviglia Grande near Milan, and the Muzza Canal also near Milan, one coming from the west and one from the east. The Canal Biana was another large canal built lower down the Po, and there were quite a good many of considerable importance built at an early date. The Biana was built still earlier than the twelfth century. There were canals dating back very much further, but those represented the same characteristics that have been spoken of in the development of irrigation in the United States; that is, they were simply canals built to supply small areas or built by individual land holders which in some cases were the old monasteries; one of the largest was built by a monastery out of Milan. Then there were those of smaller canals built from springs, etc.

When they found the increased value from irrigation and the search for water came, they went farther for water supply and tapped streams further away, bring-

ing them across intervening streams. Projects were proposed and considered by the local association, and sometimes by the Government, and out of them all, two might be especially mentioned, that have been built and under consideration for a long time and led to a variety of plans, but all essentially to the same purpose and not materially differing in character. These two canals are the Cavour Canal and the Villoresi, the first named after the Italian statesman who accomplished the unification of Italy, and the second for an engineer who had been responsible for one of the plans of the second canal.

These two canals supplement each other something as some of the canals described in India on the Jhelum and Ravi. The Cavour Canal takes part of its supply of water from the Po and traverses the province of Piedmont. It takes a large part of its supply, however, from a wide stream, the Dora Baltea. That canal is used to irrigate a portion of Piedmont north of the Po River directly, and by supplying a system of canals that are already in existence. The latter would be called a system of exchange, supplementing the supply. It supplements the supply as obtained by those canals from other sources. It ends at the Ticino river on the east border of Piedmont."

The Cavour Canal, with some other canals starting near the city of Turin, derives its supplemental supply from the Dora Baltea, crosses the Elvo, Carvo, Sesia and other streams, supplying the lands of their watersheds, and ends near the city of Novaro on the Ticino. It was constructed between 1860 and 1870. (Sketch map, *Defendants' Exhibit 35*, 1471.)

The Villoresi Canal takes water from the Ticino below Lake Maggiore and irrigates the region north of Milan and extends to the east. It is what might be termed a "high-line" canal and was built more especially to irrigate the province of Milan, while the Cavour canal was for the province of Piedmont. The Cavour canal could have been extended into the Province of Milan, but its elevation would have been so low that it would not serve much of the territory capable of irrigation, so that the Villoresi canal was started from the Ticino at a higher elevation but is essentially an extension of the idea of the Cavour canal. It was constructed in 1880. (Sketch map, *Defendants' Exhibit 36.*)

Both the Cavour and Villoresi canals are constructed and are very extensive systems. The water is used entirely for irrigation in both cases. The annual rainfall is about 36 inches and the irrigation is used to supplement the precipitation. The canals serve one of the most densely populated regions in the world.

The canal Emilinio is something of the same character. It has been under consideration by the Italian Government for twenty years and was planned before that and designed to irrigate the region near Bologna, Parma and Ferrara on the south side of the Po and on the Adriatic Sea. It is planned as a large canal at the foot of the hills and described in parts 14 and 15 of the Italian Government reports on the "Carta Idrografio D'Italia." (1472.)

Professor Carpenter, further speaking of inter-watershed diversions in Italy, says: (1472.)

> "There are no other instances of special note. There are some along the Apennines that are reported in these cases; but I have not made any particular attempt to trace these out. These are bound to be small; but would be in kind, illustrating the general principle shown by those already given, that they take water freely from any stream that may be available.
>
> I have failed to find any objections ever presented of any such manner of diversion and application of water in Italy. I have looked through the Government reports and other literature of all kinds, some, by the way, running back to the fifteenth and sixteenth centuries, in a series of authors on water in Italy, and in no case has any reference to objection on any such score been made that I have found."

Prof. Carpenter made personal inspection of the Italian canals in 1892 in company with Italian engineers and on one or two occasions with Hon. E. S. Nettleton, during which inspection photographs were taken, three of which were offered in evidence in this case, *Defendants' Exhibits 40, 41 and 42.*

Defendants' Exhibit 40 is a view of the headgate works of the Cavour Canal, two miles below Turin.

Exhibit 41 is a photograph of intake of same canal from Dora Baltea, one of the streams from which the canal derives its supply.

Exhibit 42 is a photograph of Naviglio Grande Canal in the outskirts of Milan. (1482.)

(f) *Spain.*

Irrigation in Spain runs back to an unknown period and for that reason discussions of irrigation enterprises are meagre. The country was thoroughly irrigated in the time of the Moors and portions of the southern part of Spain have been irrigated from the earliest date. Rainfall at Madrid is about the same

as at Denver, 15 inches, and has about the same latitude and prevailing weather but considerably hotter. All of the ancient cities that were occupied by the Romans used aqueducts of great extent and considerable length. The custom of irrigation was common because of the necessities.

Prof. Carpenter says: (1473.)

> "In some of the recent canals, the conditions are such that the canals take water across divides, but I have no maps, and very little descriptions except those like the Benares Canal and Isabella Canal. Both have been constructed for some years, and irrigate in the neighborhood of 70,000 to 75,000 acres each. The Tamante Canal was taken up some years ago, but I am not certain that it has been built. It was to irrigate nearly 600,000 acres. I am unable to present maps of those, and therefore cannot speak definitely as to the conditions; but along the Mediterranean Sea near Valencia there are some of the old canals dating to the time of the Moors, analogous to those on the India coast of Madras, where they take from one stream which flows into the Mediterranean and carry it over into another stream flowing also into the Mediterranean. Thus for instance, here is a canal from the Zucar and extending over into the Cataroja, and also canals from the Guadlaviar, extending likewise to the Cataroja, and also in the opposite direction one extending to the small stream of Rio Seco. These date back to a very early date.
>
> This particular map that I refer to is given in Volume 2 of Tassa's description of irrigation in Spain."

(g) *Other Diversions in the Eastern Hemisphere.*

There are inter-watershed diversions between China and Turkestan where conditions are favorable, from the head of the Chinese rivers to those running into Turkestan. There are a number of canals taking water from one stream to another. (1474-5.)

At the extreme end of the Blue Nile, the English government proposes the construction of a tunnel about two miles in length, diverting water into another branch, which would naturally flow into the Nile about 300 miles below the Blue Nile, but instead of carrying the water down this stream, take it out across the Blue Nile over into a country not at present irrigated. (1475.)

The instances enumerated are typical of diversions prevailing on the Eastern Hemisphere, where many other such di-

versions undoubtedly occur wherever irrigation prevails. (1476.)

(2) HAWAIIAN ISLANDS.

There are a number of illustrations of inter-watershed diversions in the Hawaiian Islands.

In the Island of Oahu, water is taken from streams on one side of the island and across the divide for irrigation of lands situated along streams on the other side.

In the Island of Kausi there are a number of similar diversions. The Kekaha ditch carries water across at least one stream and into an entirely different watershed. The Olokele ditch takes water from the river of the same name and carries the water across a number of independent streams, all of which empty into the Pacific by their own channels. There are a number of other canals on the same island whose diversions are of a similar nature. There are also a number of diversions of this character in the Islands of Maui and Hawaii. Some of these canals are quite old and some are recent. (3904-5.)

(3) CANADA.

There are a number of inter-watershed diversions in Canada.

Prof. Carpenter, who was a member of the Irrigation Commission of the Province of British Columbia (1432), describes the inter-watershed diversions in British Columbia as follows: (1477.)

> "In British Columbia, the conditions are there such that the streams are generally small and the valleys are narrow, and as a whole the conditions are not such where there would be any call for diversion. At the same time when acting as Commissioner for British Columbia and looking into the stream records, I found a number of instances where water was diverted across divides. There are other reasons also why they would not be expected to be present in any great number in British Columbia, because the country is very new in its irrigation development. There were, however, several instances that I recall where one stream came near enough to another with a feasible divide, so that water was brought from one shed to another.
>
> This was the case, for instance, on the branch of a stream northwest of Ashcroft in British Columbia, where it was carried across the divide on land toward Spence's Bridge and towards Ashcroft. It was also true in the

vicinity of Lake Okanogan, a region which has recently been developing rapidly as a fruit country, where water has been taken from Nelson Creek to irrigate lands to the south over towards Michigan Creek and Kelowna. These are small diversions as compared with the matters which we have had examples of elsewhere. This last enterprise was planned but not constructed, at least at that time. The question was one of funds. Near Penticton water was taken from Penticton Creek to the north, irrigating the valleys of other branches running into Okanogan Lake.

There was a more noticeable transfer across the divides at the head of the Columbia further east between Columbia and the Kootenay. It happens in this case that conditions are quite favorable. These two streams start close together with a fairly wide mountain valley, so that the water in one runs one way and the water in the other to the north, the Columbia running north at that place. The enterprise was under construction there, taking water from one into the other.

The general physical conditions in British Columbia were not very favorable for such changes; but wherever such conditions were favorable, it was being proposed and considered without objection.

There was still another, that I am not able to locate the name.

There were several smaller changes of that kind that I found, as where water was changed by permission of the Commissioner. They had a system of permits by what in the early days was called the Gold Commissioner and he had charge practically of everything pertaining to the government and all permits were issued by him. In a number of cases I found permits of this character that planned the diversion of water from one stream to another. The physical conditions seem to entirely control in these cases.

As a member of the Irrigation Commission I did not raise any objection whatever. In fact the laws as they were, permitted it, and the laws as passed did not forbid it. It was considered one of the essential conditions to the development in an irrigated country, so it was left entirely permissible.

In Alberta, conditions are similar to the conditions in British Columbia, in fact, there are streams and large plains so that development can be carried on on a large scale, and development there is in the central government instead of the local government. British Columbia, I may say, in passing, has been in about the same re-

lation to Canada as Texas has to the United States, that is, Canada owns none of the lands of British Columbia, any more than the United States does in Texas. In Alberta, on the other hand, all public lands belong to the Central Government—to the Dominion of Canada.

There are a number of streams that start from the Rocky Mountains in Alberta, running to the east mostly in the Saskatchewan drainage area. The surveys were made to some extent in the first place by the Canadian Government and an extensive series of surveys has been made by the Canadian Pacific Railway.

I have maps here of the Canadian surveys, which may be referred to by title. In 1884, is one showing a proposed method of diverting water from the Elbow into the North Fork of Fish Creek. In the report of 1897, they present a map showing the location of a canal for diverting water from White Mud River to Swift Current Creek. Also from the South Saskatchewan River to the Regina Districts. There is one in the report of 1894 from Red Deer River into the Rose Bud, and these are the official government surveys of reports showing what they contemplated under Government supervision.

In the British Province of Alberta, in the Dominion of Canada, the more recent construction has been along the Canadian Pacific Railroad from the Bow and Red Deer and connecting them together.

Practically all of the diversions in Alberta are from one tributary of the principal stream to another tributary of the same stream. They are all in the Saskatchewan drainage area.

In the case at bar, the diversion of water is from one tributary of the stream to another, all in the Platte River drainage area. The conditions here correspond so far as that situation is concerned, with those in Alberta."

Defendants' Exhibit 37, a sketch plan of the Canadian Irrigation Surveys showing the proposed location of a canal diverting water from the White Mud River to Swift Current Creek is an official map of the Dominion of Canada, taken from the report of the Canadian Irrigation Surveys of the Department of the Interior. (1480.)

This diversion is from a stream flowing into the Missouri watershed over into a stream of Hudson Bay drainage.

Defendants' Exhibit 38 is also a map made from the Canadian Irrigation Surveys, published by the Dominion of Canada showing proposed diversion of water from Elbow River into Fish Creek. (1480.)

Defendants' Exhibit 39 is another map from the same official report from the Irrigation Survey of the Dominion of Canada, showing the proposed method of diverting water from Red Deer River across the divide into Rose Bud River. (1481.)

Whether the projects shown upon the three sketch maps, Exhibits 37, 38 and 39 (from the official government publications) are constructed by the Government or some other parties they nevertheless are the work of and bear the sanction of the Government of the Dominion of Canada. (1481.)

In a letter from the Commissioner of Irrigation, Department of Interior of Alberta, to the State Engineer of Colorado, August 25, 1913, Hon. P. M. Sander, acting Commissioner of Irrigation, encloses a sketch map showing the various inter-watershed diversions of Alberta and mentions the following diversions in the following general classifications:

Continental Divide Diversions: Canadian Pacific Railway Company Irrigation scheme near Lethbridge, Alberta, to divert water from the St. Mary River, Hudson Bay drainage, and some of the waste water will run back into Pakowki lake drainage basin (no outlet) which lies in the Milk River drainage area, which is tributary to Missouri River and hence Mississippi River. With some extension of the above ditch, a considerable amount of water might go directly to Milk River drainage area. Under terms of International Waterways Treaty, U. S. Reclamation Service is diverting water directly from St. Mary River, Hudson Bay drainage into Milk River, Missouri River drainage.

Diversions from one main drainage to another: Canadian Pacific Railway Company, western section, near Calgary, Alberta, diverts from Bow River into drainage of Red Deer River; Canadian Pacific Railway Company, Lethbridge system, diverts from St. Mary River to Belley River; Southern Alberta Land Company near Medicine Hat, Alberta, diverts from Bow River into Belley River; Province of Alberta, near High River, Alberta, diverts from Highwood River, tributary to Bow River, into Little Bow River, tributary to Belley River.

Diversions from one tributary stream over the divide into watershed of another tributary stream of the same general drainage: Diversions from Battle Creek to Middle Creek, both flowing into Mile River.

Defendants' Exhibit 152 includes the above communication and the sketch accompanying the same. (3611.)

---

(4) UNITED STATES RECLAMATION SERVICE.

The United States Government, through its Reclamation Service, has entered upon the construction of several inter-

watershed or trans-mountain diversions. No heed seems to have been given to watersheds or natural barriers by the United States in its efforts at reclamation of the arid lands.
